Problems began with Flint’s water in the spring of 2014, when the city switched to Flint River water. Resident complained the tap water had strange coloring, smell and taste.

In the last month, those concerns were dramatically heightened by studies that show lead levels in some children have risen since the switch from Detroit’s water system. Those studies showed that, in some areas, lead levels in children’s blood samples have doubled and, in two ZIP codes, tripled.

In a Feb. 27 email to two DEQ staffers, Miguel Del Toral, regulations manager for EPA’s Region 5, warned Flint’s water wasn’t being sampled correctly.

“If systems are pre-flushing the tap the night before collecting … samples … (MDEQ still provides these instructions to public water systems) this clears particulate lead out of the plumbing and biases the results low by eliminating the highest lead values,” Del Toral wrote in the email.

“The particulate lead is being flushed away before collecting compliance samples which provides false assurance to resident about the true lead levels in the water.”

Another problem was that Flint and the state did not provide required “optimal corrosion control” — water additives that prevent lead from old plumbing and service lines from leaching into the drinking water.

An April 24 email from one DEQ staffer stated bluntly: “Flint is currently not practicing any corrosion control treatment at the water plant.”

On Sunday, Wyant said staffers applied standards of the Lead and Copper Rule that were designed for populations below 50,000. Flint has a population of roughly 100,000, which triggers a different set of criteria and includes performing two six-month testing programs of local water to determine proper corrosion controls.

“None of the DEQ staff in this division had ever worked on a water source switch for a community of over 50,000 people,” Wyant said. “It’s increasingly clear there was confusion here, but it also is increasingly clear that DEQ staff believed they were using the proper federal protocol and they were not.”

Thanks. We will take a look. I also wanted to let you know that MDEQ (Steve Busch, Mike Prysby, Pat Cook, and Adam Rosenthal) called this morning with questions for Mike and I regarding our comments on Flint's corrosion control plan. We thought the call went very well and they are moving ahead with our dose recommendations and monitoring suggestions. We took the opportunity to discuss monitoring and testing strategies, and preparedness for future Flint changes. They will be sending a formal response to our comments soon which we will forward to the group.

Bob,

Forwarding Flint Corrosion Control proposal info per Jim's request (see the 3 attached emails).

We had a conference call with Darren Lytle and Mike Schock this morning to get some things clarified and will be summarizing that conversation. I will include you and Jim when that gets sent out. Let us know if you need anything else.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

Hi Mike,

Please see attached updated plans for the Corrosion Control Plan for the City of Flint. These plans matches the set of plans that was submitted to your office in hard copies on Friday. This submittal is somewhat modified from the set that was submitted to you on Thursday night/Friday morning.

We will address the questions you raised and respond on Monday.

Please let me know if there are other comments that needs our attention.

Thanks for your prompt and quick response to our submittal.

GENERAL NOTES

1. CONTRACTOR SHALL BE RESPONSIBLE FOR LOCATING AND PROTECTING ALL EXISTING PUBLIC AND PRIVATE UTILITIES. UTILITY INFORMATION SHOWN ON PLANS IS NOT GUARANTEED TO BE ACCURATE OR ALL-INCLUSIVE. THE CONTRACTOR SHALL COORDINATE WITH ALL AFFECTED UTILITY COMPANIES TO DETERMINE THE LOCATIONS, THE POSSIBLE NEED FOR RELOCATIONS AND THE ACCEPTABLE MEANS AND METHODS FOR PROTECTING EXISTING UTILITIES. THE CONTRACTOR SHALL BE SOLELY RESPONSIBLE FOR ANY DAMAGE TO UTILITIES CAUSED BY CONSTRUCTION OPERATIONS.

2. NOTIFICATION OF UTILITIES: CONTRACTOR SHALL NOTIFY ALL UTILITY COMPANIES AT LEAST FORTY-EIGHT (48) HOURS PRIOR TO COMMENCEMENT OF CONSTRUCTION.

3. THE CONTRACTOR SHALL GIVE EACH UTILITY COMPANY AND THE CITY AT LEAST FIVE (5) BUSINESS DAYS PRIOR NOTICE OF PROPOSED UTILITY SHUTDOWNS. CONTRACTOR SHALL NOT OPERATE ON ANY VALVES OR SHUTDOWN ANY UTILITIES. ONLY THE UTILITY OWNERS AND THE CITY SHALL OPERATE VALVES AND SHUTDOWN UTILITIES. CONTRACTOR SHALL PROVIDE THE CITY WITH COPIES OF UTILITY OWNERS' WRITTEN APPROVAL OF PROPOSED SHUTDOWNS.

4. CONTRACTOR SHALL ASSUME COMPLETE RESPONSIBILITY FOR JOB SITE CONDITIONS DURING CONSTRUCTION OF THIS PROJECT, AND FOR THE SAFETY OF ALL PERSONS AND/OR PROPERTY ON SITE.

5. THE SAFE AND ORDERLY PASSAGE OF PEDESTRIAN AND VEHICULAR TRAFFIC SHALL BE PROVIDED WHERE OPERATIONS ABUT PUBLIC THOROUGHFARES AND ADJACENT PROPERTY.

6. NO ROADS OR ENTRANCES SHALL BE BLOCKED BY CONSTRUCTION, CONSTRUCTION DEBRIS OR EQUIPMENT FOR AN EXTENDED PERIOD OF TIME WITHOUT PRIOR APPROVAL FROM THE CITY OF FLINT. ALL ROADWAYS SHALL BE OPEN TO TRAFFIC AT THE CONCLUSION OF EACH WORK DAY WITH PROPER TRAFFIC SIGNS AND BARRICADES ERECTED FOR SAFETY, UNLESS NOTED OR APPROVED OTHERWISE.

7. CONTRACTOR SHALL COMPLY WITH ALL APPLICABLE REGULATIONS AND REQUIREMENTS.

8. ALL PROPERTY MARKERS AND REFERENCE MARKERS SHALL BE CAREFULLY PRESERVED DURING CONSTRUCTION UNTIL THEIR LOCATION HAS BEEN WITNESSED OR OTHERWISE TIED IN BY AN AUTHORIZED AGENT OR SURVEYOR.

9. INCIDENTAL COSTS: ALL ITEMS SHOWN ON THE PLANS OR IN THE SPECIFICATIONS OR THAT WHICH CAN BE INFERRED AS REQUIRED FOR THE WORK, BUT DO NOT APPEAR IN THE SUMMARY OF QUANTITIES OR SCHEDULES, SHALL BE CONSIDERED INCIDENTAL TO THE COST OF THIS PROJECT.

10. CONTRACTOR SHALL MAKE ARRANGEMENTS FOR THE PROPER BRACING, SHEETING, SHORING AND OTHER REQUIRED PROTECTION OF ALL UTILITIES, PIPELINES AND ROADWAYS BEFORE CONSTRUCTION BEGINS. CONTRACTOR SHALL BE RESPONSIBLE FOR ANY DAMAGE TO THE ROADWAYS AND ASSOCIATED STRUCTURES AND SHALL MAKE REPAIRS AS NECESSARY TO THE SATISFACTION OF THE OWNER AT THE CONTRACTOR'S EXPENSE. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE INSTALLATION AND MAINTENANCE OF ADEQUATE SIGNAGE AND WARNING DEVICES TO INFORM AND PROTECT THE PUBLIC.

11. PROTECTING CONCRETE: CONTRACTOR SHALL PROTECT ALL NEW CONCRETE WORK FROM BEING MARRED, DEFACED, OR DAMAGED ON ITS SURFACE BY PASSERS-BY. REPLACING ANY CONCRETE WORK SO MARKED SHALL BE AT THE CONTRACTOR'S EXPENSE.

12. ALL EXISTING FACILITIES SHALL BE KEPT IN SERVICE DURING CONSTRUCTION, EXCEPT WHERE PERMISSION IS OTHERWISE GRANTED BY THE CITY.

13. CONTRACTOR SHALL BE RESPONSIBLE FOR THE MEANS, METHODS, PROCEDURES, TECHNIQUES AND SEQUENCES OF CONSTRUCTION, INCLUDING SAFETY ON THE JOB SITE. NEITHER THE PROFESSIONAL ACTIVITIES OF THE ENGINEER NOR THE PRESENCE OF THE ENGINEER AT THE CONSTRUCTION SITE SHALL RELIEVE THE CONTRACTOR OF HIS OBLIGATIONS, DUTIES, AND RESPONSIBILITIES, INCLUDING ANY HEALTH AND SAFETY PRECAUTIONS REQUIRED BY ANY REGULATORY AGENCIES.

14. CONTRACTOR SHALL PLACE, GRADE AND MAINTAIN CRUSHED STONE RAMPS AS NEEDED TO PROVIDE SAFE PEDESTRIAN WALKWAYS WHERE ABRUPT CHANGES IN GRADE OCCUR AT ALL TIMES DURING THE CONSTRUCTION PROJECT, AS DIRECTED BY THE CITY'S REPRESENTATIVE.

15. CONTRACTOR SHALL PROVIDE EROSION PROTECTION UNTIL FINAL SURFACE RESTORATION.

16. SEVERAL CONSTRUCTION ITEMS FOR THIS PROJECT INVOLVE MODIFICATIONS TO EXISTING FACILITIES. ELEVATIONS, DIMENSIONS, DETAILS, ETC. HAVE BEEN SHOWN BASED UPON THE BEST AVAILABLE INFORMATION. CONTRACTOR SHALL FIELD VERIFY ALL DIMENSIONS, COORDINATES, AND ELEVATIONS BEFORE PROCEEDING WITH THE WORK., AND SHALL NOTIFY THE OWNER'S REPRESENTATIVE OF ANY DISCREPANCIES IMMEDIATELY. CONTRACTOR SHALL MAKE ADJUSTMENTS NECESSARY TO COMPLETE THE WORK AT NO ADDITIONAL COST TO THE CITY.

17. PAVING TO REMAIN SHALL BE PROTECTED FROM DAMAGE. IF DAMAGED, PAVING SHALL BE REPLACED PROMPTLY AT NO ADDITIONAL COST TO THE CITY

18. ALL DISTURBED GRASS AREAS SHALL BE HYDROMULCHED.

19. ALL EXCAVATIONS AND TRENCHES SHALL COMPLY WITH SPECIFICATION SECTION 02260 - TRENCH SAFETY SYSTEM, AND OSHA REQUIREMENTS FOR EXCAVATIONS CONTAINED IN 29 CFR PART 1926, SUBPART P.

20. THE CONTRACTOR SHALL USE CARE IN GRADING OR EXCAVATING NEAR ANY AND ALL EXISTING ITEMS, WHICH ARE NOT INDICATED TO BE REMOVED. ANY DAMAGE TO THESE EXISTING ITEMS CAUSED BY THE CONTRACTOR'S OPERATIONS SHALL BE REPAIRED TO THE SATISFACTION OF THE CITY AT THE CONTRACTOR'S EXPENSE.

21. BURNING OR INCINERATION OF RUBBISH IS NOT ALLOWED ON SITE.

22. DISPOSAL OF MATERIALS: REFER TO REQUIREMENTS IN SPECIFICATION 01576 - WASTE MATERIAL DISPOSAL. NOTIFY ENGINEER IMMEDIATELY IF CONTAMINATED SOILS OR GROUND WATER ARE ENCOUNTERED. DISPOSAL OF SOILS AND GROUNDWATER SHALL BE IN ACCORDANCE WITH LOCAL, STATE AND FEDERAL REQUIREMENTS. REFER TO REQUIREMENTS IN SPECIFICATION 02136 - WASTE MATERIAL HANDLING AND DISPOSAL.

1 CONTROL STATION PLAN - LOWER LEVEL

SCALE: 3/8" = 1'-0"

GENERAL NOTES:

1. CONTRACTOR SHALL FIELD VERIFY ALL DIMENSIONS AND ELEVATIONS.
2. DIMENSION SUBJECT TO CHANGE BASED ON FIELD MEASUREMENTS OF EXISTING CONDITIONS. CONTRACTOR SHALL MAKE CHANGES AT NO ADDITIONAL COST. SUBMIT SHOP DRAWINGS FOR APPROVAL.
3. ALL CPVC PIPE JOINTS SHALL BE SOLVENT WELD TYPE.
4. PROVIDE PIPE SUPPORTS MOUNTED OFF PUMP TABLE FOR ALL PIPING AT METERING PUMPS.
5. POLYURETHANE FOAM SHALL BE CLOSED CELL TYPE WITH MINIMUM R VALUE OF 6.5 PER INCH THICKNESS. PROVIDE MINIMUM 3" ON WALLS AND 4" ON CEILING. EXISTING METAL SURFACES SHALL BE THOROUGHLY CLEANED AND PRIMED WITH APPROPRIATE MATERIAL RECOMMENDED BY SPF PRODUCT MANUFACTURER. UPON COMPLETION, PROVIDE A MINIMUM OF 14 MILS OF DC315 (FIREPROOFING PRODUCT BY "PAINT TO PROTECT", OR APPROVED EQUAL) OVER ALL EXPOSED AREAS OF SPRAYED POLYURETHANE FOAM.

KEYED NOTES:

#

1. TAP 36" STEEL PIPE AND PROVIDE CORPORATION STOP MAIN CONNECTION. CONNECT CORPORATION STOP MAIN CONNECTION TO CPVC PIPE WITH 2 LINEAR FEET FLEXIBLE PE TUBING.
2. ¾" SCH 40 CPVC SOLUTION FEED PIPING, ROUTE ALONG CEILING.
3. ¾" SCH 40 CPVC SOLUTION FEED PIPING UP THROUGH FLOOR SLAB FROM BELOW. CORE HOLE AND GROUT ANNULAR SPACE AROUND PIPE WITH NON-SHRINK GROUT.
4. MIXING CHAMBER. MOUNT BELOW EXISTING UNIT HEATER, KEEP VERTICAL PHOSPHATE FEED LINE AS SHORT AS PRACTICAL. SEE DETAIL 2, SHEET D-6.
5. ¾" SCH 40 CPVC WATER SUPPLY PIPING, ROUTE AND SECURE TO WALL BELOW EXISTING WALL MOUNTED INSTRUMENTATION.
6. BOOSTER PUMP. ½" INLET AND ½" OUTLET.
7. ¾" COPPER TUBING. TYPE K, HARD TEMPER TEE INTO HOSE BIBB SUPPLY LINE. PROVIDE BALL TYPE SHUT-OFF VALVE.
8. EXISTING CONCRETE HOUSEKEEPING PAD.
9. ½" SCH 40 CPVC PHOSPHATE FEED PIPING WRAPPED IN HEAT TAPE, ROUTED IN 3" SCH 80 CPVC CASING. PROVIDE DOUBLE LINK SEAL AT CASING TERMINATION WITHIN CONTROL STATION BUILDING. SLOPE CASING BACK TOWARDS PHOSPHORIC ACID STORAGE BUILDING TO OVER BARREL FILLED WITH CRUSHED LIME STONE.
10. PUMP TABLE, SEE DETAIL 1, SHEET D-6 FOR FEED PUMP AND PIPING CONFIGURATION.
11. PHOSPHATE TOTE.
12. BARREL FILLED WITH CRUSHED LIME STONE.
13. SPILL CONTAINMENT PALLET, 365 GAL. SUMP CAPACITY.
14. PROVIDE SPRAY POLYURETHANE FOAM (SPF) INSULATION ON INTERIOR WALLS AND CEILING OF PHOSPHORIC ACID STORAGE BUILDING. PROVIDE MINIMUM 3" ON WALLS AND 4" ON CEILING. SEE GENERAL NOTE 5 FOR ADDITIONAL INFORMATION.

GENERAL NOTES

A. THIS SET OF ELECTRICAL DRAWINGS SHOULD ACCOMPANY A WRITTEN SET OF DIVISION SPECIFICATIONS WITH WHICH THE CONTRACTOR MUST COMPLY.

B. MAINTAIN A COMPLETE SET OF AS-BUILT DOCUMENTS THROUGHOUT CONSTRUCTION INDICATING CONDUIT ROUTING, JUNCTION BOX LOCATIONS AND ACTUAL CIRCUIT NUMBER USED AT EACH ELECTRICAL DEVICE. AS-BUILT DRAWINGS SHALL ACCURATELY REFLECT NEW AND EXISTING CONDITIONS.

C. UPON PROJECT COMPLETION PROVIDE TWO SETS OF ALL AS-BUILT DOCUMENTS (AS ELECTRONIC FORMAT AND FULL SIZE DRAWINGS) TO BUILDING ENGINEER.

D. PROVIDE ACCURATE UPDATED PANELBOARD DIRECTORIES FOR ALL AFFECTED PANELS, INDICATE NEW AND EXISTING CIRCUITS AS WELL AS SPARE CIRCUITS AND BREAKER SPACES. TURN 'OFF' ALL SPARE BREAKERS.

E. ELECTRICAL EQUIPMENT SHALL BE UL LISTED

F. NO PIPING, DUCTS, OR EQUIPMENT FOREIGN TO ELECTRICAL EQUIPMENT SHALL BE PERMITTED TO BE LOCATED WITHIN THE DEDICATED SPACE ABOVE THE ELECTRICAL EQUIPMENT.

G. PROVIDE AND MAINTAIN REQUIRED WORK SPACE, ADEQUATE ILLUMINATION, ACCESS TO WORK SPACE AND HEAD ROOM ABOUT ELECTRICAL EQUIPMENT.

H. ELECTRICAL DISTRIBUTION EQUIPMENT AND OVERCURRENT PROTECTION SYSTEM SHALL BE A FULLY RATED SYSTEM FOR SHORT CIRCUIT PROTECTION.

I. ALL EQUIPMENT FASTENED IN PLACE OR CONNECTED BY PERMANENT WIRING METHOD SHALL BE GROUNDED. SEE CONDUIT SCHEDULE AND ONE LINE DIAGRAM SHEETS FOR REQUIRED SIZES OF EQUIPMENT GROUNDING CONDUCTORS.

J. VERIFY ALL EXISTING FIELD CONDITIONS IN THE DEMOLITION AREAS PRIOR TO SUBMITTING A BID. INCLUDE IN THE BID THE COST OF REPLACEMENT, REPAIR, RELOCATION OR REMOVAL OF EXISTING MEP ELEMENTS AS REQUIRED TO COMPLETE INSTALLATION OF ALL SYSTEMS AS SPECIFIED, AND AS SHOWN ON THESE DRAWINGS. THE CONTRACTOR, BY SUBMITTING THEIR PROPOSAL, AGREES TO ACCEPT ALL EXISTING SITE CONDITIONS NOT SPECIFICALLY EXCEPTED. RETURN REUSABLE ITEMS REMOVED FROM THE DEMOLITION AREA TO THE OWNERS STOCK. REUSE OF ANY EXISTING ITEM ON THIS PROJECT, INCLUDING THOSE INDICATED ON THE DRAWING TO BE RELOCATED, SHALL BE APPROVED BY THE ENGINEER AND SHALL BE IN ACCORDANCE WITH ALL APPLICABLE CODES AND STANDARDS. WHERE THESE DRAWINGS CONFLICT WITH EXISTING FIELD CONDITIONS, A RECORD OF THE FIELD CONDITIONS SHALL BE MADE AVAILABLE TO THE OWNER AND ENGINEER.

K. EQUIPMENT SUPPLIED BY CONSUMERS ELECTRIC SHALL BE INSTALLED BY THE CONTRACTOR TO CONSUMER'S ELECTRIC'S STANDARDS AND AVAILABLE FOR INSPECTION.

L. PROVIDE ARC FLASH LABELS TO THE PROPOSED EQUIPMENT PER THE CITY FURNISHED ELECTRICAL ELECTRONIC TEMPLATE. PROVIDE A DURABLE VINYL LABEL THAT RESISTS UV, MOISTURE, ABRASION AND IS SUITABLE TO THE APPLICATION IN A WATER TREATMENT PLANT, DURALABEL TORO PREMIUM VINYL TAPE OR APPROVED EQUAL.

GENERAL NOTES:

1. ALL ELECTRICAL WORK SHALL BE IN ACCORDANCE WITH NEC 2014 AND LOCAL CODES.
2. ALL CONDUIT SHALL BE GALVANIZED RIGID CONDUIT OR LIQUIDTIGHT FLEXIBLE CONDUIT AS NOTED.
3. ALL WIRING SHALL BE TYPE THHN, OR EQUAL.
4. ALL ELECTRICAL BOXES SHALL BE 304 STAINLESS STEEL, NEMA 4X.

KEYED NOTES:

1. PROVIDE S.S. NEMA 4X LOCAL CONTROL PANEL FOR BOOSTER PUMP WITH H-O-A SWITCH. BOOSTER PUMP TO RUN IN HAND POSITION, AND IN AUTO POSITION, START BY REMOTE CONTACT CLOSURE FROM SCADA PANEL.
2. PROVIDE 2#12 & 1#12 GRND (PUMP RUN SIGNAL) IN $\frac{3}{4}$" RGS CONDUIT FROM SCADA PANEL TO BOOSTER PUMP CONTROL PANEL.
3. PROPOSED 120 V BOOSTER PUMP.
4. PROVIDE 2#12 & 1#12 GRND IN $\frac{3}{4}$" LIQUIDTIGHT FLEXIBLE CONDUIT FROM BOOSTER CONTROL PANEL TO BOOSTER PUMP.
5. PROVIDE 2#12 & 1#12 GRND IN $\frac{3}{4}$" RGS CONDUIT FROM BOOSTER CONTROL PANEL TO EXISTING LIGHTING PANEL LOCATED IN ADJACENT MOTOR CONTROL CENTER.
6. PLUG IN HEAT TAPE FOR EXTERNAL SCHEDULE 80 PIPING INTO LOCAL EXISTING 120 V RECEPTACLE.
7. PROVIDE 1" RGS CONDUIT WITH 2-PR #18 TSP (FLOW PACE SIGNAL) AND 12#14, 1#12 GRND (RUN COMMAND, FAIL SIGNAL, FLOW PULSE) FOR EACH METERING PUMP TO SCADA PANEL.
8. PROVIDE LOCAL JUNCTION BOX TO CONNECT EACH METERING PUMP WITH $\frac{3}{4}$" LIQUIDTIGHT FLEXIBLE CONDUIT AND ASSOCIATED WIRING.
9. PROPOSED 120 VOLT CHEMICAL METERING PUMP (TYP 0F TWO).
10. PROVIDE LOCAL DUPLEX RECEPTACLE FOR POWER TO METERING PUMPS. PROVIDE 2#12 & 1#12 GRND IN $\frac{3}{4}$" RGS CONDUIT TO EXISTING LIGHTING PANEL LOCATED IN MOTOR CONTROL CENTER.
11. PROVIDE 3#10 & 1#12 GRND IN $\frac{3}{4}$" RGS CONDUIT FROM CIRCUIT BREAKER IN MOTOR CONTROL CENTER TO PROPOSED UNIT ELECTRIC HEATER (TYPICAL OF TWO).
12. PROVIDE 480V - 3 PHASE UNIT ELECTRIC HEATERS WITH INTEGRAL THERMOSTAT (TYPICAL OF TWO). UNIT ELECTRIC HEATERS TO BE 10 KW, DAYTON HEAVY-DUTY MODEL 2YU70, WITH VERTICAL MOUNTING BRACKET, OR EQUAL. MOUNT UNIT HEATERS FROM EXISTING CEILING BEAMS.

Flint Phosphate Calculations

Chemical will be 75% NSF certified Phosphoric acid

75% acid has a density of 13.17 #/gal. (5,974 g/gal) 13.17×453.5923

Of this 75% is Phosphoric acid (H_3PO_4) = 4,480 g H_3PO_4/gal 5,974 × 0.75

Molecular weight of H_3PO_4 is 97.9913 g/mole

Moles H_3PO_4 / gal = 45.72 4,480/97.9913

Moles H_3PO_4 = Moles Orthophosphate (PO_4^{-3}) = Moles Phosphorus (P)

Species	Molecular Wt.	Moles / gal	g/gal
H_3PO_4	97.9913	45.72	4,480
PO_4^{-3}	94.9676	45.72	4341.92
P	30.97	45.72	1407.72

Proposed Operating Parameters

	Plant Flow	Dosage as PO_4^{-3}	Dosage as P*
Maximum	25 MGD	1.5 mg/l	0.47 mg/l
Average	16 MGD	0.8 mg/l	0.25 mg/l
Minimum	4 MGD	0.4 mg/	0.13 mg/l

*Equivalent dosage to PO_4^{-3} dosage

Feed Rate Calculations

Maximum feed rate (Max Flow × Max Dosage)

25 MGD × 3782 g/gal H_2O × 1.5 ppm / 4,341.92 g/gal = 32.66 gpd Phosphoric Acid

Average feed rate (Avg Flow × Avg Dosage)

16 MGD × 3782 g/gal H_2O × 0.8 ppm / 4,341.92 g/gal = 11.15 gpd Phosphoric Acid

Minimum feed rate (Min Flow × Min Dosage)

4 MGD × 3782 g/gal H_2O × 0.4 ppm / 4,341.92 g/gal = 1.39 gpd Phosphoric Acid

411 BULLETIN

IBC TOTE SCALE

FOR CHEMICAL IBC TOTES

Safely track chemical usage and tank levels

Warn of dangerous over and under-feed conditions

Prevent system from running empty

4-20mA remote monitoring reduces operator exposure to chemicals

NO FINGER POINTING.
NO FINE PRINT.™
PERFORMANCE GUARANTEED 5 YEAR WARRANTY™

Strict federal and state reporting requirements have created a need for water and wastewater plant operators to easily and accurately track chemical feed rates and usages. The IBC Tote Scale gives you this information along with the assurance that your chemical supply will not unexpectedly run out.

The heavy duty steel platform is protected with our advanced 80 mil thick TUF-COAT™ Environmental Armor. Tuf-Coat is highly resistant to chemicals, abrasion, impact and ultraviolet light degradation making the IBC Tote Scale ideal for even the harshest environments. Options include 316 stainless steel and MaxSense™ high accuracy models.

The IBC Tote Scale utilizes weighing technology to create a highly reliable, non-contacting chemical monitoring system that avoids problems other sensor technologies face caused by irregular tank shapes, corrosive chemical fumes, fluctuating temperatures and changes in specific gravity.

IBC Tote Scale
with integral containment option

FORCE FLOW

411 BULLETIN

IBC TOTE SCALE

MODELS AND ORDERING INFORMATION

IBC Tote Scales do not include weight indicating instrument. Select from the following: Wizard 4000® Advanced Digital Display (Bulletin 518), the SOLO® G2 Digital Weight Display (Bulletin 516), the SOLO XT® Hydraulic Digital Display (Bulletin 514), the Century Hydraulic dial (Bulletin 519)or Hypo Track® (Bulletin 517). Please order indicator separately.

ELECTRONIC **- Single Load Cell Platform** (Includes platform with backstop and electronic load cell with 20 ft. cable. Lengths up to 100 ft. available; request when ordering.)

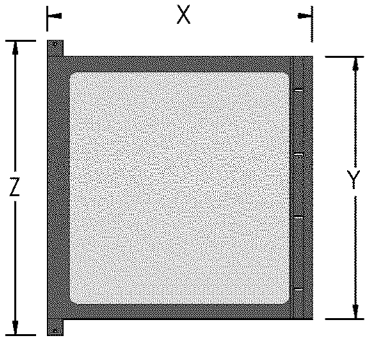
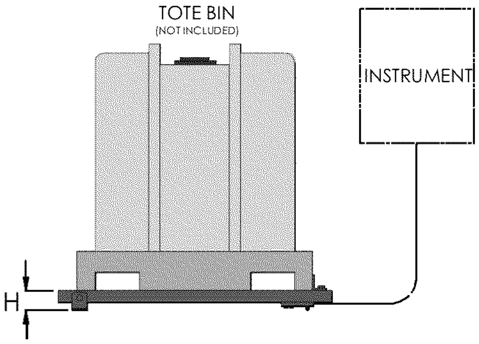
×× = CAPACITY: 1000 lbs = "10", 2000 lbs = "20", 3000 lbs = "30", 4000 lbs = "40", 5000 lbs = "50"





SPECIFYING GUIDELINES:

A. For maximum accuracy, size scale capacity to match the gross weight (chemical plus tote tare weight).

B. Tote size should not exceed platform size.

C. Supply connections must be flexible and preferably connected to tote over pivoted side of platform.

Please visit www.forceflow.com for drawings, engineered specifications and manuals.

FORCE FLOW

MODEL NUMBERS (for Load Cell & Platform)

60-DR30TC-HA4	(3,000 Lbs.)	60" x 60" x 3.25"
60-DR40TC-HA4	(4,000 Lbs.)	60" x 60" x 3.25"
60-DR50TC-HA4	(5,000 Lbs.)	60" x 60" x 3.25"
60-DR60TC-HA4	(6,000 Lbs.)	60" x 60" x 3.25"

For Stainless Steel platform, as "S" after "TC", i.e. 60-DR30TCS-HA4.
For other capacities and platform sizes, consult factory.

MODEL NUMBER (for SOLO 1000 Indicator)

SR-1000-1	1-Channel SOLO 1000 Indicator
SR-1000-2	2-Channel SOLO 1000 Indicator

MODEL NUMBER (Containment Unit)

PAK467	400 gal. NEW PIG Poly IBC Containment Unit

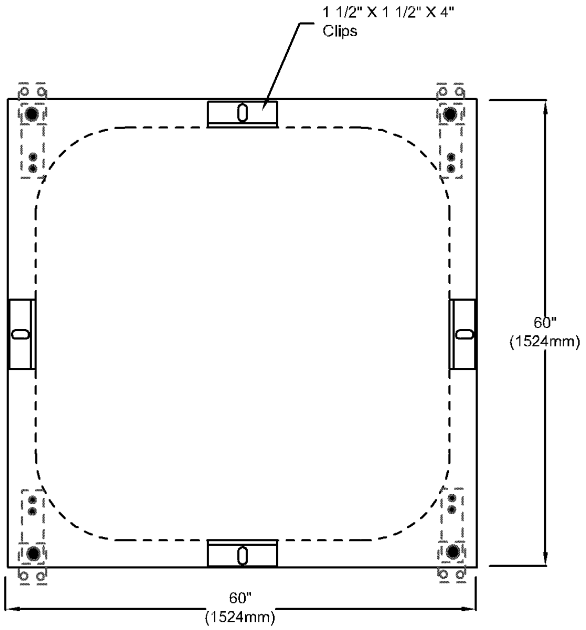
______ Scale Model Number

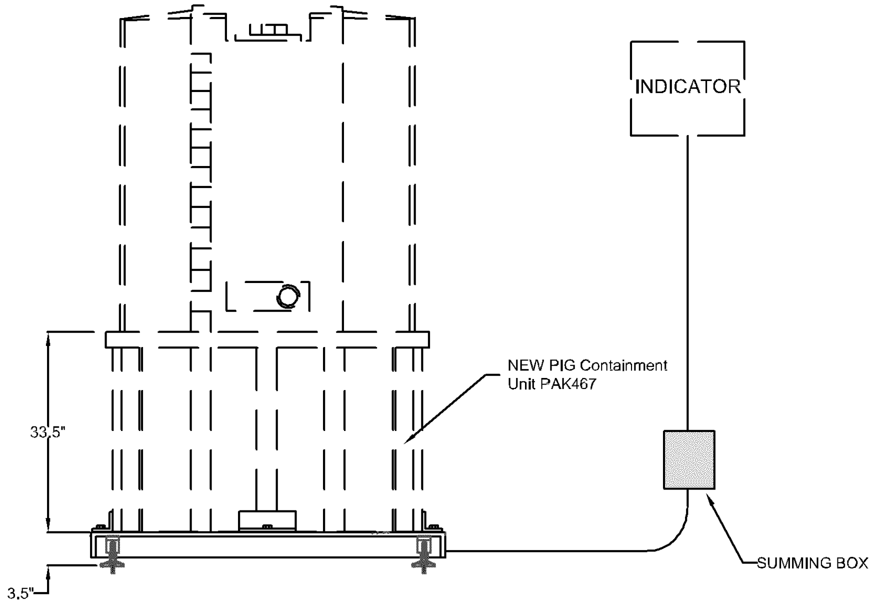
______ Pounds or Kilogram Indication

______ Feet of Cable (20' Standard)

______ Tote Skid Size

400 Containment Size (Gallons)





INSTALLATION NOTE:

We recommend using a forklift to load/unload totes.
If a pallet jack is to be used, scale platform must be pit mounted so deck is flush with floor surface.
Surface mounting with use of inclined load ramps are NOT RECOMMENDED.

Product Data Sheet

Item Number: PAK467

Item Name: PIG® Poly IBC Containment Unit

Load Capacity UDL:

- 12000 lbs./each (5443.2 kg/each)

Sump Capacity:

- 400 gal./each (1514 L/each)

Options Available:

Item #	Size	Color	Misc. Features	Amount	Length	Width	Height	Depth	Int. Dia.	Ext. Dia.	Weight	Qty/Pallet
PAK467	—	—	—	1 each	58" (147.3cm)	58" (147.3cm)	33.5" (85.1cm)	—	—	—	415lbs. (188.2kg)	1

Color: White/Black

Description:

Polyethylene containment unit used to help meet containment regulations when storing IBCs.

Application:

Used to help meet containment regulations when storing IBCs of 400 gallons or less containing materials compatible with polyethylene. IBCs can be stacked two high.

Product Features:

Super-strong Containment Unit helps you comply with regulations and store IBC tanks safely. Capture leaks, drips and spills to keep floors dry and workers safe.

- Heavy-duty construction permits double-stacking of IBCs to save space
- Solid anti-slip deck holds a variety of IBC sizes; if tank has feet or pegs, be sure to use proper support pads or plates
- Positioning pegs in pedestals keep deck from shifting
- Polyethylene construction resists UV rays, rust, corrosion and most chemicals
- Translucent white sidewalls allow easy visual inspection
- Arrives ready to use with no assembly required

Composition:

- Sump - Polyethylene
- Grates - Injection Molded Polyethylene

This product helps you comply with:

Regulatory Citation	Summary
40 CFR 264.175	Hazardous waste containment systems must be free of structural cracks or gaps, be designed to keep spilled liquids from remaining in contact with the container, prevent run-on and "have sufficient capacity to contain 10% of the volume of the containers, or the volume of the largest container, whichever is greater."

Additional Specifications:

- Dimensions (Grate): 52" L x 52" W

Disclaimers:

- **Flammables Notice:** If using this product with flammable liquids, please consider the regulations that apply to storage and handling of flammable liquids and the safety of this application, specifically flammable vapors, static discharge and heat sources. For further assistance, please call Technical Services.

Flint WTP Improvements
Corrosion Control Proposal
MDEQ Comments
October 16, 2015

1. **The compound being referenced is 75% Phosphoric Acid. We are assuming this is the orthophosphate compound. What is the % available orthophosphate as phosphate (P)?** See attached calculations.

2. **What is the density of the phosphate compound in lbs/gal?** 13.17 lb/gal @ 25°C

3. **Water from Detroit is approx. 03 – 0.4 mg/l o orthophosphate as phosphate (P). We will concur with the proposal to add sufficient orthophosphate in order to maintain a 0.5 – 1.0 mg/l as P in the distribution system.** This is the intent of the system. Dosage will be adjusted based upon measured results in the distribution system.

4. **The orthophosphate compound needs to be an NSF Standard 60 approved product.** The specification that will be used for purchase requires NSF certfication.

5. **How will the phosphate dosage be measured? Weigh scale or scada? If scales are to be used, this needs to be included in the proposal.** We will add IBC tote scales with secondary containment. The drawings will be modified to show this; see attached manufacturer's information.

6. **What is the purpose of the boosted water supply that mixes with the phosphate compound?** The boosted water supply is intended to provide sufficient injected volume to ensure complete mixing.

Subject: FW: Inquiry from Michigan Radio re Flint drinking water

Hi Bob – In your capacity as chair of the new Flint Safe Drinking Water Task Force, I'd like you to look into the status of the memo that Miguel Deltoral worked on this past summer. I understand that he has been very busy with LCR activities and our efforts to get Flint on the right track – but I think it's important to finalize the memo and to distribute it to MDEQ and the City of Flint. As you can see from the e-mail chain below, we have also gotten press inquiries about the memo. Is the delay due to figuring out how to handle personally identifiable information and health data? If so, can't we just redact that information?

To: Hyde, Tinka
Subject: Fwd: Inquiry from Michigan Radio re Flint drinking water

I am wondering why this memo hasn't been finalized. Is it because events have overtaken it -- in other words, is it the case that the recommendations in the memo have already been/are being implemented?

not been finalized, the EPA could not comment on it beyond a written statement.

Curious if that report has been finalized? If not, do you have any idea when it might be? Obviously it's sort of a hot topic again and we've gotten a few inquiries. If it is, could I get a copy of it? Or would I need to FOIA?

The draft response below is based on input from Tom Poy and the previous approved desk statement:

EPA is working to finalize the field report. In the meantime, EPA and the Michigan Department of Environmental Quality are working closely with the city of Flint to ensure that residents are provided with safe drinking water. In response to EPA and MDEQ recommendations, Flint has decided to implement corrosion control treatment and will receive EPA technical assistance to help with that effort.

EPA advises everyone across the country to flush their pipes before drawing drinking water to reduce exposure to lead. The more time water has been sitting in your home's pipes, the more lead it may contain. Anytime the water in a particular faucet has not been used for six hours or longer, "flush" the cold-water pipes by running the water before drinking and remember to use only cold water for drinking, cooking, and preparing baby formula. Flushing times can vary based on the plumbing configuration in the home and whether the home has a lead service line.

Flint residents that are concerned about lead in their drinking water should contact the water utility and may request sampling. Additional information about lead in drinking water is available at:
http://water.epa.gov/drink/contaminants/basicinformation/lead.cfm.

Subject: Inquiry from Michigan Radio re Flint drinking water

Susan,

Michigan Radio is asking:

Back in July the ACLU leaked an interim EPA report related to higher than allowable lead levels in the city of Flint. I was told then that because the report had not been finalized, the EPA could not comment on it beyond a written statement.

Curious if that report has been finalized? If not, do you have any idea when it might be? Obviously it's sort of a hot topic again and we've gotten a few inquiries. If it is, could I get a copy of it? Or would I need to FOIA?

The draft response below is based on input from Tom Poy and the previous approved desk statement:

EPA is working to finalize the field report. Subject: Re: DRAFT DELIBERATIVE. Working Draft - School Sampling Protocol

Good morning all.I went through the revised document last night and below are are my comments on the school sampling draft.

General

There is an understandable urgency to assess the situation in schools, but an equally important consideration should be the ability to assess whether progress is being made over time as treatment is introduced and monitored. It is critically important that everyone understand how to collect samples from the different types of outlets, how to interpret the sample results (i.e., what the results mean and what they don't mean) and how to effectively communicate the results to the public.

Additionally, there is always confusion over what threshold lead levels should be used and what the numerical sampling results mean. It is very important that everyone involved in the sampling and communication have proper training so that accurate information is provided to the public from the beginning. My recommendation is that training be provided by ORD as soon as possible to the health department and others that are involved before the school sampling begins. It would also be good to provide the same entities an overview on corrosion and corrosion control so that the objectives of the sampling and capabilities/limitations of the treatment are properly understood by all.

Timing of Sample Collection

The proposed timing indicates that samples should not be collected followed an extended stagnation, such as a weekend. This limitation is more appropriate for samples collected from residences, not schools. DEQ should consider collecting samples on Monday mornings, which would represent the 'worst-case' lead levels found under normal conditions that the children would be exposed to as the water routinely stagnates in the plumbing each weekend that school is in session. While this may not be typical of water usage in a home and collecting samples following extended stagnation in homes is not recommended, collecting samples in schools on Monday does reflect how water is used in schools on a regular/cyclic basis. Collecting samples during this time would provide more consistent 'worst-case' data under normal usage for evaluating the effectiveness of remedial efforts.

Sampling protocol

While I think the proposed end-point sampling is useful and can provide information on whether end-point devices should be replaced, relying solely on the proposed sampling to evaluate the safety of the water in the plumbing overall is not possible. It is essential that we have proper baseline data from throughout the school plumbing, not just the endpoints, to assess the risk as well as the progress of treatment and the best sampling protocol for that would be sequential sampling conducted at 2 or 3 locations in each school. The sequential sampling results would enable an ongoing assessment of the effectiveness of treatment throughout the plumbing network over time. This type of an assessment is not possible to do with single samples and would likely result in more questions and confusion than answers. Certainty is very important at this stage and the CRL has indicated that they can provide analytical support for Flint sampling, so it is my recommendation that Region 5 offer to provide this assistance on sequential sampling to DEQ for the school effort to supplement the work that they are proposing.

Congressman Dan Kildee Calls for Investigation into Flint Water Woes

Kildee Demands Answers, Calls Flint Lead Levels "Failure of Government at Every Level"

FLINT – Congressman Dan Kildee (MI-05) today, in his ongoing work to achieve transparency and demand answers for Flint residents, wrote a letter to the Administrator of the U.S. Environmental Protection Agency (EPA), Gina McCarthy, calling for an investigation into the causes of the water problems in Flint. Congressman Kildee called for answers to questions related to EPA's oversight of the Michigan Department of Environmental Quality and its oversight of state delegated authority that contributed to the water crisis. The letter can be viewed here.

"In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint. The failure of government to provide safe drinking water to Flint is unacceptable, and there must be accountability," Congressman Kildee's letter reads.

On Monday, the state of Michigan admitted for the first time that federal rules governing drinking water were not properly followed in Flint.

"Unfortunately, the citizens of Flint are the victims in this situation. They deserve a thorough investigation and answers to these questions," Congressman Kildee said.

Last week, after Congressman Kildee called for federal technical advisors to come to Flint, the EPA established a task force to provide expertise to the city and state.

In March, Congressman Kildee asked the EPA to forgive loans made through the Safe Drinking Water State Revolving Fund in order to free up money to make water infrastructure improvements in Flint. He also has repeatedly fought for additional emergency assistance, including lead-clearing filters and bottled water, from the federal government until a long-term solution can be reached.

Posted: Oct 21 2015 07:14AM EDT

Updated: Oct 21 2015 07:14AM EDT

LANSING, Mich. (AP) -- A top Democratic lawmaker called Tuesday for legislative hearings and an audit to probe the state's oversight of drinking water issues in Flint, which he described as "extremely troubling."

Senate Minority Leader Jim Ananich of Flint said regulators' job is to "protect people" and they failed.

Gov. Rick Snyder and the Republican-led Legislature last week approved $9.3 million in aid to address the crisis, which included $6 million to help temporarily reconnect the 99,000-resident city to Detroit's water system after elevated blood-lead levels were found in children.

Ananich stopped short of echoing demands from the Michigan Democratic Party and a liberal advocacy group that state Department of Environmental Quality Director Dan Wyant resign or be removed by Snyder.

Wyant said Monday a mistake was made and federal drinking water rules were not followed properly when Flint switched its water source from Detroit to the Flint River in a cost-cutting move while under state emergency management. He reassigned the chief of the Office of Drinking Water and Municipal Assistance but said he was convinced that program staff believed they were doing their job right.

"We need to have a thorough investigation before we make any decisions about who should be fired or anything like that," Ananich told reporters. "It's clear that he sees the gravity of the problem in his department. I think he's learning that every day. We have to get to the bottom of how folks in the drinking water division could so blatantly do everything they can in their power to hide the truth from the public."

Senate Majority Leader Arlan Meekhof formed a new Oversight Committee last month. The House has an Oversight and Ethics Committee.

Meekhof spokeswoman Amber McCann, while not immediately committing to Flint water hearings, said he and Ananich will continue talking about "what should be done in the future to prevent this type of situation."

Ananich also sent a letter to state Auditor General Doug Ringler asking that he answer specific questions in an audit of the drinking water office. The audit was already underway before Flint's water problems surfaced, he said.

Ananich wants to know how the office ensures the data it receives is accurate, what accountability measures are in place for staff and if there are policies to "escalate major infractions up the chain of command."

The Flint River is more corrosive than Detroit's water from Lake Huron, and because proper corrosion controls were not implemented after the switch in April 2014, the river water picked up lead from aging pipes that connect water mains to houses and businesses. If consumed, lead can cause developmental delays and learning disabilities.

(Kathleen E. Bachynski is a doctoral candidate at Columbia University's Mailman School of Public Health. She grew up in Bloomfield Hills and graduated with bachelor's and master's degrees from the University of Michigan.

Kathleen E. Bachynski

By Kathleen E. Bachynski

Safe drinking water is essential to public health and to living in a modern society. Over the past century, the remarkable decline in deaths from infectious diseases in the United States and across the world can be largely attributed to the provision of clean water. In 1998, Quentin Young, former president of the American Public Health Association, observed, "Turning on any kitchen faucet for a glass of drinking water without hesitation or peril is a silent homage to public health success, which would not have been possible at the start of the twentieth century."

Ensuring a safe water supply should be considered one of the fundamental public health responsibilities of government to its citizens. Yet in the past year, the ability of citizens of two of Michigan's largest cities to access safe water has been seriously threatened. Last year in Detroit, the city began shutting off water to homes where residents could not pay their water bills. This made national headlines, with United Nations experts warning that the water shutoffs were a threat to human rights.

This fall, Michiganders learned that after Flint switched to a new source, the water supply became severely contaminated with lead. In some cases, lead levels were so high as to be classified as hazardous waste. For months, children were poisoned as city and state officials downplayed the complaints of residents and denied reports documenting the water's dangers.

Officials have finally acknowledged the crisis and declared a public health emergency in Flint, but their decisions have caused irrevocable harm. The effects of lead poisoning, from kidney and brain damage to hearing loss, are irreversible.

As a result, well into the 21st century, Americans can no longer assume that they can obtain a clean glass of water from the faucets in their homes. The fundamental failure of state and local government to fulfill this obligation to their citizens is profound.

Furthermore, many of the children most affected by lead poisoning in Flint and elsewhere in the United States are from poor families. They are also far more likely to be black. What does it mean that we as a society are willing to poison these vulnerable children, or to shut off the water to residents in Detroit, one of our poorest cities? Are their lives and health expendable? If we believe that all Americans have the right to grow up safe and free from toxic poisoning, we must confront these urgent questions.

And the egregious failures in Flint and Detroit may only be the tip of the iceberg. Across the United States, safe drinking water is threatened by decaying infrastructure. The American Society of Civil Engineers has warned that we are at risk of "reversing the environmental, public health and economic gains of the last three decades" if we do not address the flaws in our water systems.

It is unconscionable that citizens of the richest country in the world should be poisoned by their own drinking water. It is outrageous that residents of the Great Lakes state, surrounded by the largest group of freshwater lakes on Earth, do not have access to safe water. All Americans should be able to turn to our kitchen faucets for water without hesitation or peril, and the public's health depends on it.

http://wmuk.org/post/flint-lawmakers-calls-investigation-deq

By Rick Pluta · 13 hours ago

(MPRN-Lansing) A Democratic state lawmaker from Flint is asking the Legislature's A uditor General to look into how the state Department of Environmental Quality handled the city's water crisis.

State Senator Jim Ananich says there's evidence that DEQ ignored warnings about elevated lead levels in the city's drinking water, and then tried to cover it up.

"I think we have to get to the bottom of how folks in the drinking water division could do everything in their power to hide the truth from the public," said Ananich, "and that's pretty much what they did."

Ananich said he would also like to see legislative hearings on what went wrong in Flint.

A DEQ spokesman says the department welcomes and will cooperate with the audit. Governor Rick Snyder has also said he will convene an independent panel to investigate.

Oct. 20, 2015 by Bre'Anna Tinsley

http://www.mlive.com/news/flint/index.ssf/2015/10/will_water.html

The Michigan Department of Environmental Quality is admitting a mistake made while working with Flint on the city's water crisis.

The state says the Office of Drinking Water and Municipal Assistance made an error in testing by following protocols for a city with fewer than 50,000 residents instead of for a city with 100,000 or more.

DEQ Director Dan Wyant says in a statement some department staff lacked experience with corrosion control.

"Simply said we do have to, again, acknowledge our mistake in this. The governor will call for an after-action review, and that review will look at local decision makers, plant operators our own actions on EPA and determine whether others should have taken additional action," Wyant says.

The City of Flint will return to Detroit's water system after months of complaints about water quality and lead exposure.

David Eggert, Associated Press 10:44 p.m. EDT October 20, 2015

LANSING – A top Democratic lawmaker called Tuesday for legislative hearings and an audit to probe the state's oversight of drinking water issues in Flint, which he described as "extremely troubling."

Senate Minority Leader Jim Ananich of Flint said regulators' job is to "protect people" and they failed.

Gov. Rick Snyder and the Republican-led Legislature last week approved $9.3 million in aid to address the crisis, which included $6 million to help temporarily reconnect the 99,000-resident city to Detroit's water system after elevated blood-lead levels were found in children.

Ananich stopped short of echoing demands from the Michigan Democratic Party and a liberal advocacy group that state Department of Environmental Quality Director Dan Wyant resign or be removed by Snyder.

Wyant said Monday a mistake was made and federal drinking water rules were not followed properly when Flint switched its water source from Detroit to the Flint River in a cost-cutting move while under state emergency management. He reassigned the chief of the Office of Drinking Water and Municipal Assistance but said he was convinced that program staff believed they were doing their job right.

"We need to have a thorough investigation before we make any decisions about who should be fired or anything like that," Ananich told reporters. "It's clear that he sees the gravity of the problem in his department. I think he's learning that every day. We have to get to the bottom of how folks in the drinking water division could so blatantly do everything they can in their power to hide the truth from the public."

Senate Majority Leader Arlan Meekhof formed a new Oversight Committee last month. The House has an Oversight and Ethics Committee.

Meekhof spokeswoman Amber McCann, while not immediately committing to Flint water hearings, said he and Ananich will continue talking about "what should be done in the future to prevent this type of situation."

Ananich also sent a letter to state Auditor General Doug Ringler asking that he answer specific questions in an audit of the drinking water office. The audit was already underway before Flint's water problems surfaced, he said.

Ananich wants to know how the office ensures the data it receives is accurate, what accountability measures are in place for staff and if there are policies to "escalate major infractions up the chain of command."

The Flint River is more corrosive than Detroit's water from Lake Huron, and because proper corrosion controls were not implemented after the switch in April 2014, the river water picked up lead from aging pipes that connect water mains to houses and businesses. If consumed, lead can cause developmental delays and learning disabilities.

on October 20, 2015 at 2:54 PM, updated October 20, 2015 at 4:46 PM

LANSING, MI — The Michigan Department of Environmental Quality "completely failed" to protect Flint residents from contaminated drinking water, according to Senate Minority Leader Jim Ananich, who is calling for a formal investigation by the Legislature.

Emails released this week show that the federal government warned the DEQ as early as February that Flint River water was causing lead and other contaminants to leach from pipes, posing a health risk for city residents that was not addressed for months.

"It's a cultural problem that people would be more concerned about hiding something than telling the public the truth, and it's really troubling," Ananich, D-Flint, told reporters Tuesday, saying he was troubled by emails sent by both state and federal workers.

"I think a thorough and robust investigation needs to happen, and I think it should happen through the legislative process. But it has to happen, and it has to happen soon to build back confidence in the department and in the state and in government in general."

The email chain is the latest development in the Flint water saga, which included significant state involvement. The city began using Flint River water in April 2014, when it was being run by a state-appointed emergency manager. Gov. Rick Snyder formally announced his plan to address elevated lead levels earlier this month.

DEQ Director Dan Wyant said Monday that his agency enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make it less corrosive.

Wyant attributed the "mistake" to drinking water program staff and announced a new interim chief for the Office of Drinking Water and Municipal Assistance.

Snyder has defended Wyant, but the Michigan Democratic Party on Monday called the governor to fire his DEQ director, a request echoed Tuesday by liberal advocacy group Progress Michigan.

Ananich, however, said there should be an investigation before any decisions of that kind are made.

"I think it's clear (Wyant) sees the gravity of the problem in his department, and I think he's learning that everyday," Ananich said. "But I think we have to get to the bottom of how folks in the drinking water division could so blatantly do everything they can in their power to hide the truth from the public, and that's pretty clearly what they did."

Ananich told reporters he has had initial discussions with Senate Majority Leader Arlan Meekhof about a legislative probe of the Flint water crisis.

He suggested the House and Senate oversight committees could hold hearings, and he noted that he's also asked the State Auditor General to expand an audit of the DEQ drinking water division that was already underway.

"I don't think we should have predetermined conditions," Ananich said. "But if things come out that people have been negligent or purposeful in their actions, I think there needs to be very serious consequences."

By Steve Carmody · 19 hours ago

A formal review is underway into the state agency that made mistakes in its monitoring

of Flint's drinking water.

Last week, the city of Flint switched back to Detroit water after a year and a half of getting its tap water from the Flint River.

Credit Steve Carmody / Michigan Radio

The state Auditor General's office expects to wrap up its review of the Office of Drinking Water and Municipal Assistance (ODWMA) next year. Specifically, the auditor is reviewing how the office oversees drinking water supplies.

State Sen. Jim Ananich, D-Flint, says he has a few questions he'd like the auditor's office to find answers to. He wants to know how the agency ensures its data is accurate and how the agency ensures accountability among its staffers.

Also in his letter to Auditor General Doug Ringler, Sen. Ananich wants to know:

What accountability measures are in place for ODWMA staff who lie or misrepresent information to the Environmental Protection Agency?

What policies do ODWMA and the Michigan Department of Environmental Quality (MDEQ) have in place to escalate major infractions up the chain of command?

Flint recently switched back to Detroit water, after independent tests confirmed rising lead levels in tap water in many city homes and in the blood of Flint children.

Problems started after the city switched its drinking water source to the Flint River. Government officials insisted from more than a year that their tests showed the water was safe to drink. But independent tests showed problems with the river water that resulted in damage to lead and iron pipes.

MDEQ director Dan Wyant says in the case of Flint, the office made mistakes.

"It's increasingly clear there was confusion here, but it also is increasingly clear that DEQ staff believed they were using the proper federal protocol and they were not," MDEQ Director Dan Wyant told Michigan Radio.

Wyant reassigned the former head of the office.

By Mike Nystrom

It was great to see the Michigan Legislature come together and put politics aside as they voted unanimously in finding a resolution to the recent Flint drinking water crisis. However, this single incident also exposed a major flaw in a system that should ensure that all residents of Michigan have access to clean drinking water, not water that is treated from polluted rivers and is brought to them through aging, deteriorating pipes.

We have all witnessed how difficult it has been for our state leaders to legislate changes in the way we fund roads. It is going to be even more difficult to bring about positive legislation to update our aging underground drinking water systems and failing sewer systems that are out of sight and, thus, out of mind.

We all take for granted that our water supply and sewage disposal systems are in fine working condition and yet, significant troubles lurk just below the literal surface in many, if not most, communities across the state.

The delay in road funding has blemished the image of the state that put the world on wheels. A continued delay in proper funding for our underground infrastructure will also be an embarrassing black eye for the Great Lakes State, whose greatest natural resource is the water in our lakes, rivers and streams.

Flint is not alone with its aging and dilapidated system challenges. Other municipalities throughout Michigan have significant problems, and no one is talking about them publicly, in most cases. Pictures of many drinking water delivery pipes, which can range anywhere from 50 to 100 years old, would horrify most people.

Flint is not alone with its aging and dilapidated system challenges.

Many people would be sickened if they truly understood that most of the beach closings that happen in Michigan on a regular basis are the result of fecal contamination due to leaching sewer systems. Even more disheartening is the fact that with very little state and federal financial support, our underground infrastructure is paid for mainly at the local level, and cash strapped municipalities have not been able to implement necessary rate increases for much needed improvements.

How many more Flint catastrophes need to happen before we wake up and fix the problem?

A comprehensive state plan is sorely needed now to begin the replacement of outdated and failing systems; and, more importantly, to properly fund our ailing underground infrastructure throughout our state. This will take cooperation from the public, as well as local and state leaders -— now – not after another public health emergency.

Clean water is essential, but it costs money. Nothing is more important to life, and nothing is taken more for granted.

The lesson of Flint has been painful and costly. Let's not repeat that hard lesson.

Let's find a solution.

Kathleen E. Bachynski

By Kathleen E. Bachynski

Safe drinking water is essential to public health and to living in a modern society. Over the past century, the remarkable decline in deaths from infectious diseases in the United States and across the world can be largely attributed to the provision of clean water. In 1998, Quentin Young, former president of the American Public Health Association, observed, "Turning on any kitchen faucet for a glass of drinking water without hesitation or peril is a silent homage to public health success, which would not have been possible at the start of the twentieth century."

Ensuring a safe water supply should be considered one of the fundamental public health responsibilities of government to its citizens. Yet in the past year, the ability of citizens of two of Michigan's largest cities to access safe water has been seriously threatened. Last year in Detroit, the city began shutting off water to homes where residents could not pay their water bills. This made national headlines, with United Nations experts warning that the water shutoffs were a threat to human rights.

This fall, Michiganders learned that after Flint switched to a new source, the water supply became severely contaminated with lead. In some cases, lead levels were so high as to be classified as hazardous waste. For months, children were poisoned as city and state officials downplayed the complaints of residents and denied reports documenting the water's dangers.

Officials have finally acknowledged the crisis and declared a public health emergency in Flint, but their decisions have caused irrevocable harm. The effects of lead poisoning, from kidney and brain damage to hearing loss, are irreversible.

As a result, well into the 21st century, Americans can no longer assume that they can obtain a clean glass of water from the faucets in their homes. The fundamental failure of state and local government to fulfill this obligation to their citizens is profound.

Furthermore, many of the children most affected by lead poisoning in Flint and elsewhere in the United States are from poor families. They are also far more likely to be black. What does it mean that we as a society are willing to poison these vulnerable children, or to shut off the water to residents in Detroit, one of our poorest cities? Are their lives and health expendable? If we believe that all Americans have the right to grow up safe and free from toxic poisoning, we must confront these urgent questions.

And the egregious failures in Flint and Detroit may only be the tip of the iceberg. Across the United States, safe drinking water is threatened by decaying infrastructure. The American Society of Civil Engineers has warned that we are at risk of "reversing the environmental, public health and economic gains of the last three decades" if we do not address the flaws in our water systems.

It is unconscionable that citizens of the richest country in the world should be poisoned by their own drinking water. It is outrageous that residents of the Great Lakes state, surrounded by the largest group of freshwater lakes on Earth, do not have access to safe water. All Americans should be able to turn to our kitchen faucets for water without hesitation or peril, and the public's health depends on it.

LANSING, MI — The Michigan Department of Environmental Quality "completely failed" to protect Flint residents from contaminated drinking water, according to Senate Minority Leader Jim Ananich, who is calling for a formal investigation by the Legislature.

Emails released this week show that the federal government warned the DEQ as early as February that Flint River water was causing lead and other contaminants to leach from pipes, posing a health risk for city residents that was not addressed for months.

"It's a cultural problem that people would be more concerned about hiding something than telling the public the truth, and it's really troubling," Ananich, D-Flint, told reporters Tuesday, saying he was troubled by emails sent by both state and federal workers.

"I think a thorough and robust investigation needs to happen, and I think it should happen through the legislative process. But it has to happen, and it has to happen soon to build back confidence in the department and in the state and in government in general."

The email chain is the latest development in the Flint water saga, which included significant state involvement. The city began using Flint River water in April 2014, when it was being run by a state-appointed emergency manager. Gov. Rick Snyder formally announced his plan to address elevated lead levels earlier this month.

DEQ Director Dan Wyant said Monday that his agency enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make it less corrosive.

Wyant attributed the "mistake" to drinking water program staff and announced a new interim chief for the Office of Drinking Water and Municipal Assistance.

Snyder has defended Wyant, but the Michigan Democratic Party on Monday called the governor to fire his DEQ director, a request echoed Tuesday by liberal advocacy group Progress Michigan.

Ananich, however, said there should be an investigation before any decisions of that kind are made.

"I think it's clear (Wyant) sees the gravity of the problem in his department, and I think he's learning that everyday," Ananich said. "But I think we have to get to the bottom of how folks in the drinking water division could so blatantly do everything they can in their power to hide the truth from the public, and that's pretty clearly what they did."

Ananich told reporters he has had initial discussions with Senate Majority Leader Arlan Meekhof about a legislative probe of the Flint water crisis.

He suggested the House and Senate oversight committees could hold hearings, and he noted that he's also asked the State Auditor General to expand an audit of the DEQ drinking water division that was already underway.

"I don't think we should have predetermined conditions," Ananich said. "But if things come out that people have been negligent or purposeful in their actions, I think there needs to be very serious consequences."

By Steve Carmody · 19 hours ago

A formal review is underway into the state agency that made mistakes in its monitoring of Flint's drinking water.

Last week, the city of Flint switched back to Detroit water after a year and a half of getting its tap water from the Flint River.

Credit Steve Carmody / Michigan Radio

The state Auditor General's office expects to wrap up its review of the Office of Drinking Water and Municipal Assistance (ODWMA) next year. Specifically, the auditor is reviewing how the office oversees drinking water supplies.

State Sen. Jim Ananich, D-Flint, says he has a few questions he'd like the auditor's office to find answers to. He wants to know how the agency ensures its data is accurate and how the agency ensures accountability among its staffers.

Also in his letter to Auditor General Doug Ringler, Sen. Ananich wants to know:

What accountability measures are in place for ODWMA staff who lie or misrepresent information to the Environmental Protection Agency?

What policies do ODWMA and the Michigan Department of Environmental Quality (MDEQ) have in place to escalate major infractions up the chain of command?

Flint recently switched back to Detroit water, after independent tests confirmed rising lead levels in tap water in many city homes and in the blood of Flint children.

Problems started after the city switched its drinking water source to the Flint River. Government officials insisted from more than a year that their tests showed the water was safe to drink. But independent tests showed problems with the river water that resulted in damage to lead and iron pipes.

MDEQ director Dan Wyant says in the case of Flint, the office made mistakes.

"It's increasingly clear there was confusion here, but it also is increasingly clear that DEQ staff believed they were using the proper federal protocol and they were not," MDEQ Director Dan Wyant told Michigan Radio.

Wyant reassigned the former head of the office.

LANSING, Mich. (AP) -

A top Democrat in Michigan's Legislature is calling for hearings and an audit to probe the state's oversight of drinking water in Flint.

Senate Minority Leader Jim Ananich says environmental regulators' actions are "extremely troubling."

Department of Environmental Quality Director Dan Wyant said Monday a mistake was made and federal drinking water rules were not followed properly when Flint switched its water source. He reassigned the chief of the Office of Drinking Water and Municipal A ssistance.

Ananich said Tuesday that legislative oversight committees should hold hearings. He also sent a letter to Michigan's auditor general asking that he investigate further as part of an already-underway audit of the drinking water office.

Flint has reconnected to Detroit's system to resolve the lead health emergency spurred by a switch to river water.

By Mike Nystrom

It was great to see the Michigan Legislature come together and put politics aside as they voted unanimously in finding a resolution to the recent Flint drinking water crisis. However, this single incident also exposed a major flaw in a system that should ensure that all residents of Michigan have access to clean drinking water, not water that is treated from polluted rivers and is brought to them through aging, deteriorating pipes.

We have all witnessed how difficult it has been for our state leaders to legislate changes in the way we fund roads. It is going to be even more difficult to bring about positive legislation to update our aging underground drinking water systems and failing sewer systems that are out of sight and, thus, out of mind.

We all take for granted that our water supply and sewage disposal systems are in fine working condition and yet, significant troubles lurk just below the literal surface in many, if not most, communities across the state.

The delay in road funding has blemished the image of the state that put the world on wheels. A continued delay in proper funding for our underground infrastructure will also be an embarrassing black eye for the Great Lakes State, whose greatest natural resource is the water in our lakes, rivers and streams.

Flint is not alone with its aging and dilapidated system challenges. Other municipalities throughout Michigan have significant problems, and no one is talking about them publicly, in most cases. Pictures of many drinking water delivery pipes, which can range anywhere from 50 to 100 years old, would horrify most people.

Flint is not alone with its aging and dilapidated system challenges.

Many people would be sickened if they truly understood that most of the beach closings that happen in Michigan on a regular basis are the result of fecal contamination due to leaching sewer systems. Even more disheartening is the fact that with very little state and federal financial support, our underground infrastructure is paid for mainly at the local level, and cash strapped municipalities have not been able to implement necessary rate increases for much needed improvements.

How many more Flint catastrophes need to happen before we wake up and fix the problem?

A comprehensive state plan is sorely needed now to begin the replacement of outdated and failing systems; and, more importantly, to properly fund our ailing underground infrastructure throughout our state. This will take cooperation from the public, as well as local and state leaders —- now – not after another public health emergency.

Clean water is essential, but it costs money. Nothing is more important to life, and nothing is taken more for granted.

The lesson of Flint has been painful and costly. Let's not repeat that hard lesson.

Let's find a solution.

Congressman Dan Kildee Calls for Investigation into Flint Water Woes

Kildee Demands Answers, Calls Flint Lead Levels "Failure of Government at Every Level"

FLINT – Congressman Dan Kildee (MI-05) today, in his ongoing work to achieve transparency and demand answers for Flint residents, wrote a letter to the Administrator of the U.S. Environmental Protection Agency (EPA), Gina McCarthy, calling for an investigation into the causes of the water problems in Flint. Congressman Kildee called for answers to questions related to EPA's oversight of the Michigan Department of Environmental Quality and its oversight of state delegated authority that contributed to the water crisis. The letter can be viewed here.

"In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint. The failure of government to provide safe drinking water to Flint is unacceptable, and there must be accountability," Congressman Kildee's letter reads.

On Monday, the state of Michigan admitted for the first time that federal rules governing drinking water were not properly followed in Flint.

"Unfortunately, the citizens of Flint are the victims in this situation. They deserve a thorough investigation and answers to these questions," Congressman Kildee said.

Last week, after Congressman Kildee called for federal technical advisors to come to Flint, the EPA established a task force to provide expertise to the city and state.

In March, Congressman Kildee asked the EPA to forgive loans made through the Safe Drinking Water State Revolving Fund in order to free up money to make water infrastructure improvements in Flint. He also has repeatedly fought for additional emergency assistance, including lead-clearing filters and bottled water, from the federal government until a long-term solution can be reached.

Gov. Rick Snyder announces Flint Water Task Force to review state, federal and municipal actions, offer recommendations

Experts in public health, water management, environmental protection to focus on steps to protect residents

Wednesday, Oct. 21, 2015

LANSING, Mich. – Gov. Rick Snyder today announced the creation of an independent advisory task force charged with reviewing actions regarding water use and testing in Flint and offer recommendations for future guidelines to protect the health and safety of all state residents.

Task force members include experts in public health and medicine, water management, and environmental protection from both sides of the aisle, and will be co-chaired by Ken Sikkema of Public Sector Consultants and Chris Kolb, of the Michigan Environmental Council. Also serving will be Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein, of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Health Center in Flint.

"Transitioning back to the Detroit Water and Sewerage Department-Great Lakes Water Authority is a good first step to protecting public health in Flint, but it's not the last step," Snyder said. "Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan."

Snyder said the administration will fully cooperate with task force members, saying he wants an unbiased report focusing on steps taken in the past and recommendations that could improve practices to ensure all residents have access to safe, clean water.

Ken Sikkema is a senior policy fellow at Public Sector Consultants, where he specializes in public finance, environment, and energy policy. Prior to joining the firm, Sikkema served in both the Michigan House and Senate, culminating with four years as Senate majority leader. He has also served as both an adjunct and visiting professor at Grand Valley State University.

Chris Kolb is president of the Michigan Environmental Council, a statewide coalition of 70 environmental, public health and faith-based nonprofit groups. Before joining the MEC, Kolb represented Ann Arbor in the state House for six years and served six years on the Ann Arbor City Council. He has been president of the MEC for six years.

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of

Michigan, having joined the faculty in 2000. Davis also is a professor of health management and policy at the School of Public Health. He previously served as the chief medical executive of the Michigan Department of Community Health/Department of Health and Human Services.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority. Rothstein also has served as Jefferson County, Alabama's rate consultant and municipal adviser for litigation related to the county's bankruptcy and issuance of $1.7 billion in sewer warrants and led strategic financial planning for the City of Atlanta's Department of Watershed Management. He has more than 30 years of experience in water, wastewater and stormwater utility finance and rate-making assessments.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center. He received his medical degree from Howard University College of Medicine and has been in practice for 36 years. He has served as president of the Genesee County Medical Society and the Michigan Chapter of the American Academy of Pediatrics. He has been honored for his humanitarian and advocacy efforts on behalf of children from the Community Foundation of Greater Flint.

Snyder has said reconnecting with the authority is a critical step to resolving water quality issues and addressing related health concerns. It will not immediately resolve the city's problem with lead service lines or aging infrastructure. It will take time for pipes in Flint to become coated with the phosphate corrosion control.

To best protect public health, state and local authorities will continue to carry out steps outlined on Oct. 2 in a comprehensive action plan, including continued testing, the use of faucet filters and providing residents with accurate information about steps to eliminate lead exposure. The Michigan Departments of Environmental Quality and Health and Human Services are continuing to provide free water filters, free lead testing through the state laboratory for Flint water customers, and hiring additional staff to conduct health exposure monitoring for lead in drinking water.

http://www.freep.com/story/news/politics/2015/10/21/task-force-appointed-examine-flint-water-controversy/74342628/

By Kathleen Gray, Detroit Free Press Lansing Bureau 5:08 p.m. EDT October 21, 2015

LANSING -- As Gov. Rick Snyder appointed an independent task force to examine the controversy over Flint's tainted water Wednesday, more lawmakers called for investigations into how the problem went unsolved for so long.

Snyder's task force will look into the actions that went into water use in the beleaguered city, as well as the testing that took place on the water after the city switched from Detroit's water and sewerage system to pulling water out of the Flint River.

Members of the task force include: former state Sen. Ken Sikkema, who now works on environmental and energy policy for Public Sector Consultants in Lansing; former state Rep. Chris Kolb, president of the Michigan Environmental Council; Dr. Matthew Davis, a professor of pediatrics and internal medicine at the University of Michigan Health System and the former chief medical executive with the Michigan Department of Community Health; Eric Rothstein, a water issues consultant with the Golardi Rothstein Group and Dr. Lawrence Reynolds, president of the Mott Children's Health Center in Flint.

“Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a statement.

The group have a working goal of finishing their work in about three months, "but their focus is to get the job done right and if takes longer, the governor will grant that to them," said Dave Murray spokesman for Snyder.

The task force will review the history of all the decisions relating to Flint water and all of the practices that took place at the federal, state and local levels.

"We'll be looking at the decision making process on going to a different water source in Flint," Kolb said. "And we want to see what lessons we can learn because there will most likely be other communities looking to change their source of water and we want to make sure there drinking is safe too."

The committee, which informally met for the first time Wednesday, will make recommendations to the Snyder administration on things like whether laws and regulations need to change and if there are practices that need to take place in water systems across the state, Kolb said.

The appointment of the task force came on the same day that two Flint lawmakers -- U.S. Rep. Dan Kildee and state Sen. Jim Ananich, both Flint Democrats -- stepped up their calls for outside investigations of the Flint water crisis.

They've asked the EPA to conduct a review of the Michigan Department of Environmental Quality's oversight of the water switch in Flint. According to documents released through the Freedom of Information Act, the EPA had been warning the state for months that there were elevated levels of lead in the city's water before the state took significant action on the problem.

“We need an accurate and thorough investigation to determine whether the misapplication of federal water testing rules was intentional or due to negligence,” said A nanich, who also has asked the state Auditor General to look into the MDEQ's drinking water division. “Accountability is absolutely necessary to restoring Flint’s trust in our government."

Ananich also said the task force should look into who should be held accountable for the mistakes that happened in allowing the city of Flint water to continue using river water even after it was discovered that lead was leaching into the water from corroding lead pipes.

“These individuals may be the right individuals to make policy recommendations to ensure these failures never happen again, but they likely lack the investigative background to fully hold the individuals responsible for this public health crisis accountable for their actions," he said.

Kildee asked the EPA to answer questions regarding its own oversight of the MDEQ.

"The EPA needs to conduct a thorough investigation into the causes of the water problems in Flint. The failure of government to provide safe drinking water to Flint is unacceptable, and there must be accountability,” he said. "“Unfortunately, the citizens of Flint are the victims in this situation."

In 2014, Flint officials ended the city's contract with Detroit, saying that water costs were too high and estimating it would save the city $1.5 million a month. They opted instead to pull from the Karegnondi Water Authority, which is building a system to supply Genesee County with water from Lake Huron. But until the new system comes online in 2016, Flint is temporarily pulling water from the Flint River. Since it made the switch, residents have complained that the water is discolored, smells and makes them sick.

Hurley Medical Center pediatrician Dr. Mona Hanna-Attisha jump-started the state's response when she reported that the number of Flint children with elevated blood-lead levels — 5 micrograms per deciliter or more — jumped from 2.1% in the 20 months prior to Sept. 15, 2013, to 4% between Jan. 1 and Sept. 15 this year. In certain ZIP codes, the change was even more troubling, she said — jumping from 2.5% of the children tested to 6.3%.

http://www.detroitnews.com/story/news/local/michigan/2015/10/21/flint-water-epa-kildee/74326460/

Melissa Nann Burke, The Detroit News 11:20 a.m. EDT October 21, 2015

Washington — Rep. Dan Kildee has requested an investigation by the U.S. Environmental Protection Agency into the Flint water crisis, saying the unacceptable lead levels detected in the city's water "were a failure of government at every level."

Kildee, a Democrat from Flint Township, wrote Wednesday to EPA Administrator Gina McCarthy about the need for accountability "to restore confidence and to ensure that these failures never happen again," following revelations that lead levels existed in city water at dangerous levels for months.

"Unfortunately, the citizens of Flint are the victims in this situation. They deserve a thorough investigation and answers to these questions," Kildee wrote to McCarthy.

Michigan Senate Minority Leader Jim Ananich has also requested a formal EPA review of the state environmental department's oversight of water treatment in Flint.

"We need an accurate and thorough investigation to determine whether the misapplication of federal water testing rules was intentional or due to negligence," said A nanich, D-Flint.

The request came as Gov. Rick Snyder formed what he called a five-member "independent advisory task force" headed by former Michigan Senate Majority Leader Ken Sikkema, a Republican and current senior policy fellow at Public Sector Consultants, and Chris Kolb, a Democratic former state representative and president of the Michigan Environmental Council.

The group will review how water use and testing was handled in Flint and offer recommendations for future guidelines to protect the health and safety of all of the state's residents, according to Snyder's office.

"Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a statement.

Other task force members are Dr. Matthew Davis of the University of Michigan Health

System, Dr. Lawrence Reynolds of Mott Children's Health Center in Flint and Eric Rothstein of the Galardi Rothstein Group.

The request by Kildee and Ananich comes after Michigan's top environmental official acknowledged late Sunday the state made mistakes in its handling of Flint's long-running water crisis. He made changes, including reassigning a top official responsible for the safety of drinking water.

Dan Wyant, director of Michigan's Department of Environmental Quality, has said staff members applied the wrong standards of the Lead and Copper Rule that governs testing and monitoring for drinking water. The result was that proper controls regarding corrosion were not put in place when the city began drawing its water from the Flint River in spring 2014.

Kildee is requesting that, at minimum, the EPA conduct a review of its oversight of state programs, looking at issues such as whether the federal agency evaluated testing guidelines that the state was using in Flint.

Wyant admitted Sunday the state applied the wrong standards of the Lead and Copper Rule, using the standard for cities with populations of 50,000 or less instead of the one for a population like Flint's, which is closer to 100,000.

Kildee asks whether EPA was aware that the state was applying wrong standards of the Lead and Copper Rule. He also wants to know when the EPA first became aware of potential elevated levels of lead in Flint's water, and at what point the agency is required to notify officials after learning of such an issue.

The congressman requested that McCarthy respond by Oct. 27.

The state released documents in the past week to the media — originally requested by Virginia Tech professor Marc Edwards — showing state officials seemingly failed to heed repeated warnings from the EPA as far back as February about potential problems with Flint's water system.

The EPA is sending federal technical advisers to assist with the Flint crisis, following requests by Kildee's office last week.

Gov. Rick Snyder said this week he's asked for a report on how the state's environmental department didn't detect lead-leaching corrosion in the city's aging pipelines.

Problems began with Flint's water in the spring of 2014, when the city switched to Flint River water. Residents complained the tap water had strange coloring, smell and taste.

In the last month, those concerns were dramatically heightened by studies that show lead levels in some children have risen since the switch from Detroit's water system.

Those studies showed that, in some areas, lead levels in children's blood samples have doubled and, in two ZIP codes, tripled.

By Ron Fonger | rfonger1@mlive.com
on October 21, 2015 at 12:36 PM, updated October 21, 2015 at 12:37 PM

FLINT, MI -- The U.S. Environmental Protection Agency is being asked to investigate the cause of water problems in Flint by U.S. Rep. Dan Kildee, D-Flint, and state Senate Minority Leader Jim Ananich, D-Flint.

In separate letters to Gina McCarthy, administrator of the EPA, today, Oct. 21, the legislators asked for the federal review of the Michigan Department of Environmental Quality's oversight of water treatment here.

Researchers from Virginia Tech university and a Hurley Medical Center doctor discovered high lead levels in Flint's water supply and rising blood lead levels in children since the city switched its water source from Lake Huron to the Flint River in April 2014.

DEQ Director Dan Wyant said this week that state regulators mistakenly allowed the city to distribute river water without requiring that it be treated to make it less corrosive.

The corrosive water has caused lead service lines in the city to leach lead at a higher rate into tap water, officials have said.

"It has become clear to me that unacceptable lead levels were a failure of government at every level," Kildee's letter says. "Despite evidence presented indicating the water quality was unsafe, repeated assurances were given by both the MDEQ and EPA that the water was safe to consume ...

"In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint," the letter continues. "The failure of government to provide safe drinking water to Flint is unacceptable, and there must be accountability."

Ananich's letter says several questions remain about the water sampling conducted by the city and tested by the state, including the location of sampling and instructions given to water customers to pre-flush their taps prior to testing, "resulting in lower lead level results."

The Flint Journal-MLive could not immediately reach representatives of the EPA or DEQ for comment.

http://www.startribune.com/congressman-seeks-federal-probe-into-flint-water-problems/335240561/

By JEFF KAROUB and DAVID EGGERT Associated Press

October 21, 2015 — 4:10pm

DETROIT — Officials in Michigan are asking the U.S. Environmental Protection Agency to answer questions about its oversight of state environmental regulators after elevated blood-lead levels were found in children whose Flint homes received river water.

U.S. Rep. Dan Kildee, who represents the Flint area in Congress, and state Senate Minority Leader Jim Ananich said Wednesday that they have sent letters to the EPA.

Flint reconnected to Detroit's water system last week in hopes of resolving the health emergency.

"It has become clear to me that unacceptable lead levels were a failure of government at every level," Kildee wrote in a letter to EPA Administrator Gina McCarthy. "In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint."

The EPA told The Associated Press that the agency is reviewing the requests from Democrats Ananich and Kildee.

Flint, a city of about 99,000 people, switched from Detroit's water system last year in a cost-cutting move. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron that's scheduled to be completed next year. But residents complained about the taste, smell and appearance of water coming into their homes and businesses from the Flint River.

Doctors later discovered corrosive water was drawing lead from aging pipes in some homes.

State Department of Environmental Quality Director Dan Wyant said Monday that federal drinking water rules were not followed properly when Flint made the switch to river water.

Gov. Rick Snyder and the Republican-led Legislature last week approved $9.3 million in aid to address the crisis, which included $6 million to help temporarily reconnect the city to Detroit's water system.

Ananich on Tuesday called for the state Legislature to hold hearings on the water crisis.

Michigan's Republican Senate Majority Leader Arlan Meekhof told reporters Wednesday that he was "concerned" about the crisis and wants to see the Snyder administration's "after-action" reports. But he was noncommittal when asked about Ananich's request for legislative hearings.

"At this point I haven't decided if that's an appropriate course of action," Meekhof said.

"There's a whole lot of blame to go around, but at this point we now have fixed the problem so we don't have the problems that lead to lead contamination in schools, as far as I know," he said.

Snyder on Wednesday announced the creation of an independent advisory task force to review Flint's water use and testing. The group includes public health and medicine, water management and environmental protection experts.

"Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a release.

Gov. Rick Snyder announces support of the city of Flint's plan to switch back to Detroit water due to increasing lead levels during a news conference with Mayor Dayne Walling in Flint on Thursday Oct. 8, 2015Flint Journal file photo

FLINT, MI -- Gov. Rick Snyder has appointed a task force to review "actions regarding water use and testing in Flint" and to make recommendations for future guidelines.

The governor announced creation of the task force in a news release Wednesday, Oct. 21, the same day U.S. Rep. Dan Kildee, D-Flint, and state Sen. Jim Ananich, D-Flint, called for the U.S. Environmental Protection Agency to carry out a similar review.

"Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a news release.

State Department of Environmental Quality Director Dan Wyant said this week that state regulators mistakenly allowed Flint to distribute Flint River water without requiring that it be treated to make it less corrosive since April 2014.

Corrosive water has caused service lines to leach lead at a faster rate into tap water, elevating the level of lead in the water and in the blood of infants and children, experts and officials have said.

Members of the state task force are Ken Sikkema of Public Sector Consultants, Chris Kolb of the Michigan Environmental Council, Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Hospital.

Sikkema and Kolb will co-chair the task force, the news release says.

Reynolds was one of the health officials in Flint who sounded warnings about the increasing lead levels since the city changed its drinking water source from Lake Huron to the Flint River more than 17 months ago.

Sara Wurfel, a spokeswoman for Snyder, said in an email that the task force will "operate as transparently as possible and there are certainly expected to be opportunities for public input."

Wurfel did not say in response to questions from The Flint Journal-MLive whether the task force would operate under the provisions of the Open Meetings Act, conduct its business in public or have subpoena powers.

"The task force will be independent and our administration has pledged full and complete cooperation," she said.

The governor's news release says he wants an unbiased report that's focused on steps taken in the past and recommendations that could improve practices.

Here is more information on each task force member:

Sikkema is a senior policy fellow at Public Sector Consultants, where he specializes in public finance, environment, and energy policy. Prior to joining the firm, Sikkema served in both the Michigan House and Senate, including four years as Senate majority leader.

Kolb is president of the Michigan Environmental Council, a statewide coalition of 70 environmental, public health and faith-based nonprofit groups. Before joining the MEC, he represented Ann Arbor in the state House for six years and served six years on the Ann Arbor City Council.

Davis is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan. He previously served as the chief medical executive of the Michigan Department of Community Health/Department of Health and Human Services.

Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent adviser on the creation of the Great Lakes Water Authority.

Reynolds is a pediatrician in Flint who serves as president of the Mott Children's Health Center. He received his medical degree from Howard University College of Medicine and has been in practice for 36 years. He has served as president of the Genesee County Medical Society and the Michigan Chapter of the American Academy of Pediatrics.

http://michiganradio.org/post/gov-snyder-creates-task-force-investigate-actions-around-flint-water-crisis

By Mark Brush · 2 hours ago

Gov. Rick Snyder announced the creation of an “independent advisory task force” that will look into the actions surrounding the management and testing of Flint’s drinking water system.

The goal, according to a press release from the governor’s office, is to investigate what happened and to prevent the kind of problems that occurred with Flint’s drinking water system in other systems in the state.

A state-appointed emergency manager made the decision to switch the city’s water supply in the spring of 2014. The emergency manager switched to Flint River water to save money. Complaints about the quality of the water surfaced soon after. The state didn’t act until independent researchers pointed out that some residents were likely being exposed to unsafe levels of lead because of the way the water was being managed.

The state, the city, and a private foundation recently put up $12 million to switch the city back to water from Lake Huron managed by the Detroit Sewerage & Water Department.

More from the press release:

Snyder said the administration will fully cooperate with task force members, saying he wants an unbiased report focusing on steps taken in the past and recommendations that could improve practices to ensure all residents have access to safe, clean water

The task force will be co-chaired by Ken Sikkema of Public Sector Consultants and Chris Kolb,of the Michigan Environmental Council. Members will include Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group, and Dr. Lawrence Reynolds of Mott Children's Health Center in Flint.

http://www.9and10news.com/story/30318477/gov-snyder-announces-task-force-will-take-on-flints-water-emergency

Posted: Oct 21, 2015 1:52 PM CST Updated: Oct 21, 2015 1:52 PM CST

By Jamie Valentine, Producer

Governor Snyder says a Flint water task force will take on the city's water emergency.

Recent problems with high levels of lead in the water prompted the emergency.

Governor Snyder says experts in public health and medicine, along with water management and environmental protection will work together on protecting the people of Flint.

High lead levels have been found in children drinking the Flint water.

The city has now reconnected to Detroit's water system to stop any other health emergencies.

"Apparently it's going to be a thing now."

Lackadaisical and dismissive -- that's the tone of a Michigan Department of Environmental Quality spokeswoman's response to a July e-mail noting that a member of a second media outlet had made an inquiry about elevated lead levels in Flint's drinking water. And it's a perfectly tone-deaf representation of that agency's response to the public health crisis then brewing in that impoverished town.

This week, the state acknowledged that it made mistakes in approving and overseeing Flint's transition to a new water source last year, that it misunderstood and misapplied federal rules meant to keep dangerous substances like lead and copper out of drinking water. The state was finally spurred to action after a local pediatrician found that an increasing number of Flint kids had elevated blood-lead levels.

Back in July, it was a different story. Months of MDEQ e-mails, obtained through the Freedom of Information Act by Virginia Tech University researcher Marc Edwards, show a stunning indifference on the part of state environmental officials, who seemed focused on deflecting criticism. Flint, officials insisted, with MDEQ's blessing was in compliance with federal safety guidelines. End of story.

Frankly, it seemed some state officials thought dealing with inquiries about lead in Flint was a hassle.

"... I just got a call from MI Public Radio[sic] about an EPA notice to Flint about elevated lead levels in the water. Apparently, you were cc'd on EPA's note. Can you call me ASA P? Thanks!" MDEQ spokesman Brad Wurfel wrote to a handful of department officials in a July 9 e-mail.

Karen Tommasulo, another MDEQ public information officer, wrote back: "This is what Curt Guyette had been calling about, by the way. Apparently it's going to be a thing now."

b

This e-mail, obtained by Virginia Tech researcher Marc Edwards, is a communication between public relations officials at the Michigan Department of Environmental Quality. Emphasis added by Edwards. (Photo: Marc Edwards))

For months, residents had reported problems with Flint's water, some caused by the local treatment plant's addition of a disinfectant to the water supply. But now there were concerns about lead levels. Guyette, an investigative reporter for the American Civil Liberties Union, was preparing to break a leaked U.S. Environmental Protection Agency memo that called nearly every aspect of the state's lead monitoring in Flint into question. He asked for comment. Repeatedly. ("ACLU guy is back today," Tommasulo wrote in a July 8 e-mail.)

MDEQ officials stalled. Guyette published. Then Michigan Radio got the memo.

With at least two reporters on the story, Flint's lead problem -- despite MDEQ officials' best efforts to the contrary -- had, indeed, become a thing.

But it would be months before MDEQ officials, much less Gov. Rick Snyder, would make that acknowledgement publicly, or move to improve Flint's drinking water.

The state monitored Flint's water for a year; in the first six-month round of testing completed last December, results showed Flint's water had 6 parts per billion of lead, below the EPA's actionable level of 15 ppb, but in excess of that agency's 5 ppb threshold for reevaluation of local water treatment plans. A second round of tests, finished in June, showed up to 11 ppb of lead in Flint water, even though the MDEQ advised residents to pre-flush water from pipes before collecting samples, a method not approved by the EPA. The spike in lead is a trend officials should've found disturbing.

Subject: Re: HIGH LEAD: FLINT Water testing Results

Jen/all - I think things got garbled in translation...

What I was saying is that where you find Pb values that high, it is usually due to particulate lead. **Not always, but generally. Particulate lead is released sporadically from lead service lines, leaded solder and leaded brass in a number of ways and folks tend to discount these values as anomalies, but particulate lead release is a normal part of the corrosion process and it is universal (common) in all systems. It's just that it is not captured as often by the infrequent LCR sampling. If systems are pre-flushing the tap the night before collec on thisting LCR compliance samples (MDEQ still provides these instructions to public water systems) this clears particulate lead out of the plumbing and biases the results low by eliminating the highest lead values. If systems are pre-flushing and still finding particulate lead, the amount of particulate lead in the system can be higher than what is being detected using these 'pre-flushed' first-draw samples.** My point on that was that people are exposed to the particulate lead on a daily basis, but the particulate lead is being flushed away before collecting compliance samples which provides false assurance to residents about the true lead levels in the water.

This e-mail, acquired by Virginia Tech researcher Marc Edwards through the Freedom of Information Act, show an email from EPA drinking water specialist Miguel Del Toral and MDEQ officials. Emphasis added by Edwards. (Photo: Marc Edwards)

But while discussing the EPA's memo privately, acknowledging the city wasn't adequately treating its water -- even as results of water analysis by Virginia Tech's Edwards began to show heightened concentrations of lead in the water -- department officials continued to publicly insist that Flint's water supply was safe.

Why? The e-mails -- largely correspondence among Wurfel, MDEQ district engineer Michael Prysby, district supervisor Stephen Busch, former drinking water chief Liane Shekter Smith and EPA officials --don't offer much explanation, beyond petty insistence that the department hadn't erred, a kind of bruised-ego approach that considered any criticism distasteful, and a bureaucratic blindness to scientific evidence that should have suggested that meeting water standards may not have been sufficient to ensure residents' safety.

Gov. Rick Snyder has formed an independent task force to review government actions in Flint. The decision to switch the water supply was made while the city was under the oversight of Snyder-appointed emergency managers. U.S. Rep. Dan Kildee and state Rep. Jim Ananich, both Flint Democrats, have called for a federal investigation.

In February, EPA drinking water specialist Miguel Del Toral, the memo's author, informed state officials that there was likely particulate lead in Flint's water, and that this was likely because the local treatment plant hadn't employed corrosion control -- the addition of chemicals that form a film inside aging service lines to prevent lead from leaching into the water.

Flint began pumping its own water from the Flint River in 2014; it opted not to add those chemicals to its water, something officials now say probably violated of federal standards -- instead adding lime to decrease the acidity, and thus corrosivity, of the water. The EPA advised the MDEQ, as early as February and consistently throughout the year, that Flint's water system should be using corrosion control. But it never happened. In October, the city switched back to Detroit water.

This e-mail, obtained by Virginia Tech researcher Marc Edwards, is from an EPA representative asking MDEQ officials about having Flint start using corrosion controls in its water. Emphasis added by Edwards. (Photo: Marc Edwards)

In an e-mail before a conference call to discuss the memo, Shekter Smith asked the EPA to confirm in writing that the state was in compliance with federal rules, and expressed displeasure that the memo had been leaked. She never mentioned the memo's content.

The EPA water specialist, Del Toral, was dismissed by Wurfel in September as a "rogue employee"; Edwards, the Virginia Tech researcher and McArthur genius grant recipient -- who has tested water samples from hundreds of Flint homes -- was written off as a man with an agenda, someone whose work didn't merit serious examination. Community groups, Wurfel wrote, were keeping residents "hopped up."

Former drinking water chief Liane Shekter Smith -- she's been reassigned within MDEQ because of her role in the crisis -- earnestly explained to Flint resident LeeAnne Walters in an e-mail that samples taken from her home couldn't be included in citywide test results, because Walters had installed a filter. Yet filtered samples taken from Walters' home showed lead concentrations astronomically higher than the EPA's 15 ppb limit -- 107 ppb, 397 ppb, 707 ppb. It's difficult to understand why Walters' filtered samples -- with lead concentrations that were off the charts -- didn't appear to trigger alarm bells for Shekter Smith, or any other MDEQ official.

It's among the many inexplicable exchanges revealed in the e-mails.

Again and again, MDEQ officials noted that the city planned to switch water supplies again next year, when a new regional water authority is complete. Any testing or treatment plan would just have to be re-done -- so why bother? When Virginia Tech researcher Edwards' team began working in Flint, state officials wondered whether to let him know that the city was changing its water supply, and not to waste resources.

Everything was fine, MDEQ insisted, in alignment with federal standards.

To: Saxton, Thomas (Treasury); Muchmore, Dennis (GOV); Wyant, Dan (DEQ)
Subject: FW: Need upate on lead / copper tests for Flint

Guys, here's an update and some clarification on the lead situation in Flint. Please limit this information to internal for now.

By the tenants of the federal statute, the city is in compliance for lead and copper. That aside, they have not optimized their water treatment (for the most part, this means adding phosphates to minimize the degree that the water Ph mobilizes lead and copper in people's home plumbing).

Compliance with the standard started with testing. A June-December run of tests (all in homes with lead in their premise plumbing) concluded in December. Another January – June round of sampling concluded last month. Everything checks out in terms of compliance, but now the next step is optimizing the water supply.

So, In about two weeks, DEQ will be sending a formal communication about the optimizing issue. The federal program has long timelines for action. A community water supplier gets 18 months to study the options, and two years thereafter to implement water system optimization measures.

My point: Conceivably, by the time we're halfway through the first timeline, the city will begin using a new water source with KWA ... and conceivably, the whole process starts all over again.

In terms of near-future issues, the bottom line is that residents of Flint do not need to worry about lead in their water supply, and DEQ's recent sampling does not indicate an eminent health threat from lead or copper. That said, anyone with lead pipes in their premise plumbing (this translates to tens of thousands of homes in our older urban centers, btw) should at least be aware that they have them, and to some limited degree that's going to impart minute parts per billion of lead in water no matter what. Its why nobody uses lead water pipes anymore.

This e-mail, obtained by Virginia Tech researcher Marc Edwards through the Freedom of Information Act, updating administration officials on questions regarding the safety of Flint's water. Emphasis added by Edwards. (Photo: Marc Edwards)

And they might have thought that was true. Or true enough.

If there's such a thing as benign neglect, this was malignant indifference, on an institutional level.

I'm reminded of the old cliche: For evil to flourish, all that's required is that good people do nothing. In Flint, what happened was more insidious: For evil to flourish, all that's required is for people to do exactly, and only, what is required of them. Nothing less.

Nothing more.

http://nbc25news.com/news/local/newly-released-e-mails-show-epa-knew-about-lead-in-flints-drinking-water

By Stephanie Parkinson Tuesday, October 20th 2015

FLINT — Newly released e-mails show, as far back as February, the federal government knew of the dangers lurking in Flint's drinking water.

Documents obtained by Virginia Tech researchers reveal discussions between Michigan Department of Environmental Quality, Environmental Protection Agency, and city leaders.

Inside those e-mails is communication that shows the EPA downplayed health concerns brought forward by one of its own.

February 27 Miguel Del Toral, a drinking water expert with the EPA, sent an e-mail to several people within MDEQ telling them lead was in the drinking water in Flint.

In April, he sent another memo, this time to the EPA, again warning of high lead levels in Flint's water.

All of this was more than seven months before any action was taken.

Flint Mayor Dayne Walling says he was left out of the loop.

"Experts were bringing their advice to the table and it was stuck in Lansing, and the rest of us had no idea," said Walling.

The e-mail, stating lead was in the water in Flint, was not sent to anyone within the City of Flint.

Other e-mails reveal Mayor Walling asked the EPA about Del Toral's memo. He was told it was a draft report and once it had been vetted it would be shared.

"I was shocked by the confusion," said Walling. "The EPA delegated authority to the MDEQ, information wasn't coming, what did come was bad information and it led to the serious situation that we're in now. There has to be an investigation."

What these e-mails also reveal is by mid-August the City of Flint's water plant supervisor was told by the MDEQ the city needed to put corrosion control measures in place right away, to prevent lead from getting in the drinking water.

Mayor Walling says the city reacted as quickly as it could, but says an internal investigation in the city will also be done.

"We're going to get to the bottom of everything that happened," said Walling. "We need to understand everything that happened before then, and who did what, and what they knew."

Our calls to the EPA were not returned in time for air Tuesday.

http://www.freep.com/story/news/politics/2015/10/21/task-force-appointed-examine-flint-water-controversy/74342628/

By Kathleen Gray, Detroit Free Press Lansing Bureau 5:08 p.m. EDT October 21, 2015

LANSING -- As Gov. Rick Snyder appointed an independent task force to examine the controversy over Flint's tainted water Wednesday, more lawmakers called for investigations into how the problem went unsolved for so long.

Snyder's task force will look into the actions that went into water use in the beleaguered city, as well as the testing that took place on the water after the city switched from Detroit's water and sewerage system to pulling water out of the Flint River.

Members of the task force include: former state Sen. Ken Sikkema, who now works on environmental and energy policy for Public Sector Consultants in Lansing; former state Rep. Chris Kolb, president of the Michigan Environmental Council; Dr. Matthew Davis, a professor of pediatrics and internal medicine at the University of Michigan Health System and the former chief medical executive with the Michigan Department of Community Health; Eric Rothstein, a water issues consultant with the Golardi Rothstein Group and Dr. Lawrence Reynolds, president of the Mott Children's Health Center in Flint.

“Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a statement.

The group have a working goal of finishing their work in about three months, "but their focus is to get the job done right and if takes longer, the governor will grant that to them," said Dave Murray spokesman for Snyder.

The task force will review the history of all the decisions relating to Flint water and all of the practices that took place at the federal, state and local levels.

"We'll be looking at the decision making process on going to a different water source in

Flint," Kolb said. "And we want to see what lessons we can learn because there will most likely be other communities looking to change their source of water and we want to make sure there drinking is safe too."

The committee, which informally met for the first time Wednesday, will make recommendations to the Snyder administration on things like whether laws and regulations need to change and if there are practices that need to take place in water systems across the state, Kolb said.

The appointment of the task force came on the same day that two Flint lawmakers -- U.S. Rep. Dan Kildee and state Sen. Jim Ananich, both Flint Democrats -- stepped up their calls for outside investigations of the Flint water crisis.

They've asked the EPA to conduct a review of the Michigan Department of Environmental Quality's oversight of the water switch in Flint. According to documents released through the Freedom of Information Act, the EPA had been warning the state for months that there were elevated levels of lead in the city's water before the state took significant action on the problem.

“We need an accurate and thorough investigation to determine whether the misapplication of federal water testing rules was intentional or due to negligence,” said A nanich, who also has asked the state Auditor General to look into the MDEQ's drinking water division. “Accountability is absolutely necessary to restoring Flint’s trust in our government."

Ananich also said the task force should look into who should be held accountable for the mistakes that happened in allowing the city of Flint water to continue using river water even after it was discovered that lead was leaching into the water from corroding lead pipes.

“These individuals may be the right individuals to make policy recommendations to ensure these failures never happen again, but they likely lack the investigative background to fully hold the individuals responsible for this public health crisis accountable for their actions," he said.

Kildee asked the EPA to answer questions regarding its own oversight of the MDEQ.

"The EPA needs to conduct a thorough investigation into the causes of the water problems in Flint. The failure of government to provide safe drinking water to Flint is unacceptable, and there must be accountability,” he said. "“Unfortunately, the citizens of Flint are the victims in this situation."

In 2014, Flint officials ended the city's contract with Detroit, saying that water costs were too high and estimating it would save the city $1.5 million a month. They opted instead to pull from the Karegnondi Water Authority, which is building a system to supply Genesee County with water from Lake Huron. But until the new system comes online in

2016, Flint is temporarily pulling water from the Flint River. Since it made the switch, residents have complained that the water is discolored, smells and makes them sick.

Hurley Medical Center pediatrician Dr. Mona Hanna-Attisha jump-started the state's response when she reported that the number of Flint children with elevated blood-lead levels — 5 micrograms per deciliter or more — jumped from 2.1% in the 20 months prior to Sept. 15, 2013, to 4% between Jan. 1 and Sept. 15 this year. In certain ZIP codes, the change was even more troubling, she said — jumping from 2.5% of the children tested to 6.3%.

http://www.detroitnews.com/story/news/local/michigan/2015/10/21/flint-water-epa-kildee/74326460/

Melissa Nann Burke, The Detroit News 11:20 a.m. EDT October 21, 2015

Washington — Rep. Dan Kildee has requested an investigation by the U.S. Environmental Protection Agency into the Flint water crisis, saying the unacceptable lead levels detected in the city's water "were a failure of government at every level."

Kildee, a Democrat from Flint Township, wrote Wednesday to EPA Administrator Gina McCarthy about the need for accountability "to restore confidence and to ensure that these failures never happen again," following revelations that lead levels existed in city water at dangerous levels for months.

"Unfortunately, the citizens of Flint are the victims in this situation. They deserve a thorough investigation and answers to these questions," Kildee wrote to McCarthy.

Michigan Senate Minority Leader Jim Ananich has also requested a formal EPA review of the state environmental department's oversight of water treatment in Flint.

"We need an accurate and thorough investigation to determine whether the misapplication of federal water testing rules was intentional or due to negligence," said A nanich, D-Flint.

The request came as Gov. Rick Snyder formed what he called a five-member "independent advisory task force" headed by former Michigan Senate Majority Leader Ken Sikkema, a Republican and current senior policy fellow at Public Sector Consultants, and Chris Kolb, a Democratic former state representative and president of the Michigan Environmental Council.

The group will review how water use and testing was handled in Flint and offer recommendations for future guidelines to protect the health and safety of all of the state's residents, according to Snyder's office.

"Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a statement.

Other task force members are Dr. Matthew Davis of the University of Michigan Health System, Dr. Lawrence Reynolds of Mott Children's Health Center in Flint and Eric Rothstein of the Galardi Rothstein Group.

The request by Kildee and Ananich comes after Michigan's top environmental official acknowledged late Sunday the state made mistakes in its handling of Flint's long-running water crisis. He made changes, including reassigning a top official responsible for the safety of drinking water.

Dan Wyant, director of Michigan's Department of Environmental Quality, has said staff members applied the wrong standards of the Lead and Copper Rule that governs testing and monitoring for drinking water. The result was that proper controls regarding corrosion were not put in place when the city began drawing its water from the Flint River in spring 2014.

Kildee is requesting that, at minimum, the EPA conduct a review of its oversight of state programs, looking at issues such as whether the federal agency evaluated testing guidelines that the state was using in Flint.

Wyant admitted Sunday the state applied the wrong standards of the Lead and Copper Rule, using the standard for cities with populations of 50,000 or less instead of the one for a population like Flint's, which is closer to 100,000.

Kildee asks whether EPA was aware that the state was applying wrong standards of the Lead and Copper Rule. He also wants to know when the EPA first became aware of potential elevated levels of lead in Flint's water, and at what point the agency is required to notify officials after learning of such an issue.

The congressman requested that McCarthy respond by Oct. 27.

The state released documents in the past week to the media — originally requested by Virginia Tech professor Marc Edwards — showing state officials seemingly failed to heed repeated warnings from the EPA as far back as February about potential problems with Flint's water system.

The EPA is sending federal technical advisers to assist with the Flint crisis, following requests by Kildee's office last week.

Gov. Rick Snyder said this week he's asked for a report on how the state's environmental department didn't detect lead-leaching corrosion in the city's aging pipelines.

Problems began with Flint's water in the spring of 2014, when the city switched to Flint River water. Residents complained the tap water had strange coloring, smell and taste.

In the last month, those concerns were dramatically heightened by studies that show lead levels in some children have risen since the switch from Detroit's water system. Those studies showed that, in some areas, lead levels in children's blood samples have doubled and, in two ZIP codes, tripled.

http://www.mlive.com/news/flint/index.ssf/2015/10/kildee_ananich_call_for_federa.html

By Ron Fonger | rfonger1@mlive.com
on October 21, 2015 at 12:36 PM, updated October 21, 2015 at 12:37 PM

FLINT, MI -- The U.S. Environmental Protection Agency is being asked to investigate the cause of water problems in Flint by U.S. Rep. Dan Kildee, D-Flint, and state Senate Minority Leader Jim Ananich, D-Flint.

In separate letters to Gina McCarthy, administrator of the EPA, today, Oct. 21, the legislators asked for the federal review of the Michigan Department of Environmental Quality's oversight of water treatment here.

Researchers from Virginia Tech university and a Hurley Medical Center doctor discovered high lead levels in Flint's water supply and rising blood lead levels in children since the city switched its water source from Lake Huron to the Flint River in April 2014.

DEQ Director Dan Wyant said this week that state regulators mistakenly allowed the city to distribute river water without requiring that it be treated to make it less corrosive.

The corrosive water has caused lead service lines in the city to leach lead at a higher rate into tap water, officials have said.

"It has become clear to me that unacceptable lead levels were a failure of government at every level," Kildee's letter says. "Despite evidence presented indicating the water quality was unsafe, repeated assurances were given by both the MDEQ and EPA that the water was safe to consume ...

"In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint," the letter continues. "The failure of government to provide safe drinking water to Flint is unacceptable, and there must be accountability."

Ananich's letter says several questions remain about the water sampling conducted by the city and tested by the state, including the location of sampling and instructions given to water customers to pre-flush their taps prior to testing, "resulting in lower lead level results."

The Flint Journal-MLive could not immediately reach representatives of the EPA or DEQ for comment.

By JEFF KAROUB and DAVID EGGERT Associated Press

October 21, 2015 — 4:10pm

DETROIT — Officials in Michigan are asking the U.S. Environmental Protection Agency to answer questions about its oversight of state environmental regulators after elevated blood-lead levels were found in children whose Flint homes received river water.

U.S. Rep. Dan Kildee, who represents the Flint area in Congress, and state Senate Minority Leader Jim Ananich said Wednesday that they have sent letters to the EPA.

Flint reconnected to Detroit's water system last week in hopes of resolving the health emergency.

"It has become clear to me that unacceptable lead levels were a failure of government at every level," Kildee wrote in a letter to EPA Administrator Gina McCarthy. "In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint."

The EPA told The Associated Press that the agency is reviewing the requests from Democrats Ananich and Kildee.

Flint, a city of about 99,000 people, switched from Detroit's water system last year in a cost-cutting move. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron that's scheduled to be completed next year. But residents complained about the taste, smell and appearance of water coming into their homes and businesses from the Flint River.

Doctors later discovered corrosive water was drawing lead from aging pipes in some homes.

State Department of Environmental Quality Director Dan Wyant said Monday that federal drinking water rules were not followed properly when Flint made the switch to river water.

Gov. Rick Snyder and the Republican-led Legislature last week approved $9.3 million in aid to address the crisis, which included $6 million to help temporarily reconnect the city to Detroit's water system.

Ananich on Tuesday called for the state Legislature to hold hearings on the water crisis.

Michigan's Republican Senate Majority Leader Arlan Meekhof told reporters Wednesday that he was "concerned" about the crisis and wants to see the Snyder administration's "after-action" reports. But he was noncommittal when asked about Ananich's request for legislative hearings.

"At this point I haven't decided if that's an appropriate course of action," Meekhof said.

"There's a whole lot of blame to go around, but at this point we now have fixed the problem so we don't have the problems that lead to lead contamination in schools, as far as I know," he said.

Snyder on Wednesday announced the creation of an independent advisory task force to review Flint's water use and testing. The group includes public health and medicine, water management and environmental protection experts.

"Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a release.

Gov. Rick Snyder announces support of the city of Flint's plan to switch back to Detroit water due to increasing lead levels during a news conference with Mayor Dayne Walling in Flint on Thursday Oct. 8, 2015Flint Journal file photo

FLINT, MI -- Gov. Rick Snyder has appointed a task force to review "actions regarding water use and testing in Flint" and to make recommendations for future guidelines.

The governor announced creation of the task force in a news release Wednesday, Oct. 21, the same day U.S. Rep. Dan Kildee, D-Flint, and state Sen. Jim Ananich, D-Flint, called for the U.S. Environmental Protection Agency to carry out a similar review.

"Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan," Snyder said in a news release.

State Department of Environmental Quality Director Dan Wyant said this week that state regulators mistakenly allowed Flint to distribute Flint River water without requiring that it be treated to make it less corrosive since April 2014.

Corrosive water has caused service lines to leach lead at a faster rate into tap water, elevating the level of lead in the water and in the blood of infants and children, experts and officials have said.

Members of the state task force are Ken Sikkema of Public Sector Consultants, Chris Kolb of the Michigan Environmental Council, Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Hospital.

Sikkema and Kolb will co-chair the task force, the news release says.

Reynolds was one of the health officials in Flint who sounded warnings about the increasing lead levels since the city changed its drinking water source from Lake Huron to the Flint River more than 17 months ago.

Sara Wurfel, a spokeswoman for Snyder, said in an email that the task force will "operate as transparently as possible and there are certainly expected to be opportunities for public input."

Wurfel did not say in response to questions from The Flint Journal-MLive whether the task force would operate under the provisions of the Open Meetings Act, conduct its business in public or have subpoena powers.

"The task force will be independent and our administration has pledged full and complete cooperation," she said.

The governor's news release says he wants an unbiased report that's focused on steps taken in the past and recommendations that could improve practices.

Here is more information on each task force member:

Sikkema is a senior policy fellow at Public Sector Consultants, where he specializes in public finance, environment, and energy policy. Prior to joining the firm, Sikkema served in both the Michigan House and Senate, including four years as Senate majority leader.

Kolb is president of the Michigan Environmental Council, a statewide coalition of 70 environmental, public health and faith-based nonprofit groups. Before joining the MEC, he represented Ann Arbor in the state House for six years and served six years on the Ann Arbor City Council.

Davis is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan. He previously served as the chief medical executive of the Michigan Department of Community Health/Department of Health and Human Services.

Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent adviser on the creation of the Great Lakes Water Authority.

Reynolds is a pediatrician in Flint who serves as president of the Mott Children's Health Center. He received his medical degree from Howard University College of Medicine and has been in practice for 36 years. He has served as president of the Genesee County Medical Society and the Michigan Chapter of the American Academy of Pediatrics.

http://michiganradio.org/post/gov-snyder-creates-task-force-investigate-actions-around-flint-water-crisis

By Mark Brush · 2 hours ago

Gov. Rick Snyder announced the creation of an “independent advisory task force” that will look into the actions surrounding the management and testing of Flint’s drinking water system.

The goal, according to a press release from the governor’s office, is to investigate what happened and to prevent the kind of problems that occurred with Flint’s drinking water system in other systems in the state.

A state-appointed emergency manager made the decision to switch the city’s water supply in the spring of 2014. The emergency manager switched to Flint River water to save money. Complaints about the quality of the water surfaced soon after. The state didn't act until independent researchers pointed out that some residents were likely being exposed to unsafe levels of lead because of the way the water was being managed.

The state, the city, and a private foundation recently put up $12 million to switch the city back to water from Lake Huron managed by the Detroit Sewerage & Water Department.

More from the press release:

Snyder said the administration will fully cooperate with task force members, saying he wants an unbiased report focusing on steps taken in the past and recommendations that could improve practices to ensure all residents have access to safe, clean water

The task force will be co-chaired by Ken Sikkema of Public Sector Consultants and Chris Kolb,of the Michigan Environmental Council. Members will include Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group, and Dr. Lawrence Reynolds of Mott Children's Health Center in Flint.

http://www.9and10news.com/story/30318477/gov-snyder-announces-task-force-will-take-on-flints-water-emergency

Posted: Oct 21, 2015 1:52 PM CST Updated: Oct 21, 2015 1:52 PM CST

By Jamie Valentine, Producer

Governor Snyder says a Flint water task force will take on the city's water emergency.

Recent problems with high levels of lead in the water prompted the emergency.

Governor Snyder says experts in public health and medicine, along with water management and environmental protection will work together on protecting the people of Flint.

High lead levels have been found in children drinking the Flint water.

The city has now reconnected to Detroit's water system to stop any other health emergencies.

"Apparently it's going to be a thing now."

Lackadaisical and dismissive -- that's the tone of a Michigan Department of Environmental Quality spokeswoman's response to a July e-mail noting that a member of a second media outlet had made an inquiry about elevated lead levels in Flint's drinking water. And it's a perfectly tone-deaf representation of that agency's response to the public health crisis then brewing in that impoverished town.

This week, the state acknowledged that it made mistakes in approving and overseeing Flint's transition to a new water source last year, that it misunderstood and misapplied federal rules meant to keep dangerous substances like lead and copper out of drinking water. The state was finally spurred to action after a local pediatrician found that an increasing number of Flint kids had elevated blood-lead levels.

Back in July, it was a different story. Months of MDEQ e-mails, obtained through the Freedom of Information Act by Virginia Tech University researcher Marc Edwards, show a stunning indifference on the part of state environmental officials, who seemed focused on deflecting criticism. Flint, officials insisted, with MDEQ's blessing was in compliance with federal safety guidelines. End of story.

Frankly, it seemed some state officials thought dealing with inquiries about lead in Flint was a hassle.

"... I just got a call from MI Public Radio[sic] about an EPA notice to Flint about elevated lead levels in the water. Apparently, you were cc'd on EPA's note. Can you call me ASA P? Thanks!" MDEQ spokesman Brad Wurfel wrote to a handful of department officials in a July 9 e-mail.

Karen Tommasulo, another MDEQ public information officer, wrote back: "This is what Curt Guyette had been calling about, by the way. Apparently it's going to be a thing now."

b

This e-mail, obtained by Virginia Tech researcher Marc Edwards, is a communication between public relations officials at the Michigan Department of Environmental Quality. Emphasis added by Edwards. (Photo: Marc Edwards))

For months, residents had reported problems with Flint's water, some caused by the local treatment plant's addition of a disinfectant to the water supply. But now there were concerns about lead levels. Guyette, an investigative reporter for the American Civil Liberties Union, was preparing to break a leaked U.S. Environmental Protection Agency memo that called nearly every aspect of the state's lead monitoring in Flint into question. He asked for comment. Repeatedly. ("ACLU guy is back today," Tommasulo wrote in a July 8 e-mail.)

MDEQ officials stalled. Guyette published. Then Michigan Radio got the memo.

With at least two reporters on the story, Flint's lead problem -- despite MDEQ officials' best efforts to the contrary -- had, indeed, become a thing.

But it would be months before MDEQ officials, much less Gov. Rick Snyder, would make that acknowledgement publicly, or move to improve Flint's drinking water.

The state monitored Flint's water for a year; in the first six-month round of testing completed last December, results showed Flint's water had 6 parts per billion of lead, below the EPA's actionable level of 15 ppb, but in excess of that agency's 5 ppb threshold for reevaluation of local water treatment plans. A second round of tests, finished in June, showed up to 11 ppb of lead in Flint water, even though the MDEQ advised residents to pre-flush water from pipes before collecting samples, a method not approved by the EPA. The spike in lead is a trend officials should've found disturbing.

Subject: Re: HIGH LEAD: FLINT Water testing Results

Jen/all - I think things got garbled in translation...

What I was saying is that where you find Pb values that high, it is usually due to particulate lead. **Not always, but generally. Particulate lead is released sporadically from lead service lines, leaded solder and leaded brass in a number of ways and folks tend to discount these values as anomalies, but particulate lead release is a normal part of the corrosion process and it is universal (common) in all systems. It's just that it is not captured as often by the infrequent LCR sampling. If systems are pre-flushing the tap the night before collec on thisting LCR compliance samples (MDEQ still provides these instructions to public water systems) this clears particulate lead out of the plumbing and biases the results low by eliminating the highest lead values. If systems are pre-flushing and still finding particulate lead, the amount of particulate lead in the system can be higher than what is being detected using these 'pre-flushed' first-draw samples.** My point on that was that people are exposed to the particulate lead on a daily basis, but the particulate lead is being flushed away before collecting compliance samples which provides false assurance to residents about the true lead levels in the water.

This e-mail, acquired by Virginia Tech researcher Marc Edwards through the Freedom of Information Act, show an email from EPA drinking water specialist Miguel Del Toral and MDEQ officials. Emphasis added by Edwards. (Photo: Marc Edwards)

But while discussing the EPA's memo privately, acknowledging the city wasn't adequately treating its water -- even as results of water analysis by Virginia Tech's Edwards began to show heightened concentrations of lead in the water -- department officials continued to publicly insist that Flint's water supply was safe.

Why? The e-mails -- largely correspondence among Wurfel, MDEQ district engineer Michael Prysby, district supervisor Stephen Busch, former drinking water chief Liane Shekter Smith and EPA officials --don't offer much explanation, beyond petty insistence that the department hadn't erred, a kind of bruised-ego approach that considered any criticism distasteful, and a bureaucratic blindness to scientific evidence that should have suggested that meeting water standards may not have been sufficient to ensure residents' safety.

Gov. Rick Snyder has formed an independent task force to review government actions in Flint. The decision to switch the water supply was made while the city was under the oversight of Snyder-appointed emergency managers. U.S. Rep. Dan Kildee and state Rep. Jim Ananich, both Flint Democrats, have called for a federal investigation.

In February, EPA drinking water specialist Miguel Del Toral, the memo's author, informed state officials that there was likely particulate lead in Flint's water, and that this was likely because the local treatment plant hadn't employed corrosion control -- the addition of chemicals that form a film inside aging service lines to prevent lead from leaching into the water.

Flint began pumping its own water from the Flint River in 2014; it opted not to add those chemicals to its water, something officials now say probably violated of federal standards -- instead adding lime to decrease the acidity, and thus corrosivity, of the water. The EPA advised the MDEQ, as early as February and consistently throughout the year, that Flint's water system should be using corrosion control. But it never happened. In October, the city switched back to Detroit water.

This e-mail, obtained by Virginia Tech researcher Marc Edwards, is from an EPA representative asking MDEQ officials about having Flint start using corrosion controls in its water. Emphasis added by Edwards. (Photo: Marc Edwards)

In an e-mail before a conference call to discuss the memo, Shekter Smith asked the EPA to confirm in writing that the state was in compliance with federal rules, and expressed displeasure that the memo had been leaked. She never mentioned the memo's content.

The EPA water specialist, Del Toral, was dismissed by Wurfel in September as a "rogue employee"; Edwards, the Virginia Tech researcher and McArthur genius grant recipient -- who has tested water samples from hundreds of Flint homes -- was written off as a man with an agenda, someone whose work didn't merit serious examination. Community groups, Wurfel wrote, were keeping residents "hopped up."

Former drinking water chief Liane Shekter Smith -- she's been reassigned within MDEQ because of her role in the crisis -- earnestly explained to Flint resident LeeAnne Walters in an e-mail that samples taken from her home couldn't be included in citywide test results, because Walters had installed a filter. Yet filtered samples taken from Walters' home showed lead concentrations astronomically higher than the EPA's 15 ppb limit -- 107 ppb, 397 ppb, 707 ppb. It's difficult to understand why Walters' filtered samples -- with lead concentrations that were off the charts -- didn't appear to trigger alarm bells for Shekter Smith, or any other MDEQ official.

It's among the many inexplicable exchanges revealed in the e-mails.

Again and again, MDEQ officials noted that the city planned to switch water supplies again next year, when a new regional water authority is complete. Any testing or treatment plan would just have to be re-done -- so why bother? When Virginia Tech researcher Edwards' team began working in Flint, state officials wondered whether to let him know that the city was changing its water supply, and not to waste resources.

Everything was fine, MDEQ insisted, in alignment with federal standards.

To: Saxton, Thomas (Treasury); Muchmore, Dennis (GOV); Wyant, Dan (DEQ)
Subject: FW: Need upate on lead / copper tests for Flint

Guys, here's an update and some clarification on the lead situation in Flint. Please limit this information to internal for now.

By the tenants of the federal statute, the city is in compliance for lead and copper. That aside, they have not optimized their water treatment (for the most part, this means adding phosphates to minimize the degree that the water Ph mobilizes lead and copper in people's home plumbing).

Compliance with the standard started with testing. A June-December run of tests (all in homes with lead in their premise plumbing) concluded in December. Another January – June round of sampling concluded last month. Everything checks out in terms of compliance, but now the next step is optimizing the water supply.

So, In about two weeks, DEQ will be sending a formal communication about the optimizing issue. The federal program has long timelines for action. A community water supplier gets 18 months to study the options, and two years thereafter to implement water system optimization measures.

My point: Conceivably, by the time we're halfway through the first timeline, the city will begin using a new water source with KWA ... and conceivably, the whole process starts all over again.

In terms of near-future issues, the bottom line is that residents of Flint do not need to worry about lead in their water supply, and DEQ's recent sampling does not indicate an eminent health threat from lead or copper. That said, anyone with lead pipes in their premise plumbing (this translates to tens of thousands of homes in our older urban centers, btw) should at least be aware that they have them, and to some limited degree that's going to impart minute parts per billion of lead in water no matter what. Its why nobody uses lead water pipes anymore.

This e-mail, obtained by Virginia Tech researcher Marc Edwards through the Freedom of Information Act, updating administration officials on questions regarding the safety of Flint's water. Emphasis added by Edwards. (Photo: Marc Edwards)

And they might have thought that was true. Or true enough.

If there's such a thing as benign neglect, this was malignant indifference, on an institutional level.

I'm reminded of the old cliche: For evil to flourish, all that's required is that good people do nothing. In Flint, what happened was more insidious: For evil to flourish, all that's required is for people to do exactly, and only, what is required of them. Nothing less.

Nothing more.

http://nbc25news.com/news/local/newly-released-e-mails-show-epa-knew-about-lead-in-flints-drinking-water

By Stephanie Parkinson Tuesday, October 20th 2015

FLINT — Newly released e-mails show, as far back as February, the federal government knew of the dangers lurking in Flint's drinking water.

Documents obtained by Virginia Tech researchers reveal discussions between Michigan Department of Environmental Quality, Environmental Protection Agency, and city leaders.

Inside those e-mails is communication that shows the EPA downplayed health concerns brought forward by one of its own.

February 27 Miguel Del Toral, a drinking water expert with the EPA, sent an e-mail to several people within MDEQ telling them lead was in the drinking water in Flint.

In April, he sent another memo, this time to the EPA, again warning of high lead levels in Flint's water.

All of this was more than seven months before any action was taken.

Flint Mayor Dayne Walling says he was left out of the loop.

"Experts were bringing their advice to the table and it was stuck in Lansing, and the rest of us had no idea," said Walling.

The e-mail, stating lead was in the water in Flint, was not sent to anyone within the City of Flint.

Other e-mails reveal Mayor Walling asked the EPA about Del Toral's memo. He was told it was a draft report and once it had been vetted it would be shared.

"I was shocked by the confusion," said Walling. "The EPA delegated authority to the MDEQ, information wasn't coming, what did come was bad information and it led to the serious situation that we're in now. There has to be an investigation."

What these e-mails also reveal is by mid-August the City of Flint's water plant supervisor was told by the MDEQ the city needed to put corrosion control measures in place right away, to prevent lead from getting in the drinking water.

Mayor Walling says the city reacted as quickly as it could, but says an internal investigation in the city will also be done.

"We're going to get to the bottom of everything that happened," said Walling. "We need to understand everything that happened before then, and who did what, and what they knew."

Our calls to the EPA were not returned in time for air Tuesday.

Gov. Rick Snyder announces Flint Water Task Force to review state, federal and municipal actions, offer recommendations

Experts in public health, water management, environmental protection to focus on steps to protect residents

Wednesday, Oct. 21, 2015

LANSING, Mich. – Gov. Rick Snyder today announced the creation of an independent advisory task force charged with reviewing actions regarding water use and testing in Flint and offer recommendations for future guidelines to protect the health and safety of all state residents.

Task force members include experts in public health and medicine, water management, and environmental protection from both sides of the aisle, and will be co-chaired by Ken Sikkema of Public Sector Consultants and Chris Kolb, of the Michigan Environmental Council. Also serving will be Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein, of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Health Center in Flint.

"Transitioning back to the Detroit Water and Sewerage Department-Great Lakes Water Authority is a good first step to protecting public health in Flint, but it's not the last step," Snyder said. "Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan."

Snyder said the administration will fully cooperate with task force members, saying he wants an unbiased report focusing on steps taken in the past and recommendations that could improve practices to ensure all residents have access to safe, clean water.

Ken Sikkema is a senior policy fellow at Public Sector Consultants, where he specializes in public finance, environment, and energy policy. Prior to joining the firm, Sikkema served in both the Michigan House and Senate, culminating with four years as Senate majority leader. He has also served as both an adjunct and visiting professor at Grand Valley State University.

Chris Kolb is president of the Michigan Environmental Council, a statewide coalition of 70 environmental, public health and faith-based nonprofit groups. Before joining the MEC, Kolb represented Ann Arbor in the state House for six years and served six years on the Ann Arbor City Council. He has been president of the MEC for six years.

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan, having joined the faculty in 2000. Davis also is a professor of health management and policy at the School of Public Health. He previously served as the chief medical executive of the Michigan Department of Community Health/Department of Health and Human Services.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority. Rothstein also has served as Jefferson County, Alabama's rate consultant and municipal adviser for litigation related to the county's bankruptcy and issuance of $1.7 billion in sewer warrants and led strategic financial planning for the City of Atlanta's Department of Watershed Management. He has more than 30 years of experience in water, wastewater and stormwater utility finance and rate-making assessments.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center. He received his medical degree from Howard University College of Medicine and has been in practice for 36 years. He has served as president of the Genesee County Medical Society and the Michigan Chapter of the American Academy of Pediatrics. He has been honored for his humanitarian and advocacy efforts on behalf of children from the Community Foundation of Greater Flint.

Snyder has said reconnecting with the authority is a critical step to resolving water quality issues and addressing related health concerns. It will not immediately resolve the city's problem with lead service lines or aging infrastructure. It will take time for pipes in Flint to become coated with the phosphate corrosion control.

To best protect public health, state and local authorities will continue to carry out steps outlined on Oct. 2 in a comprehensive action plan, including continued testing, the use of faucet filters and providing residents with accurate information about steps to eliminate lead exposure. The Michigan Departments of Environmental Quality and Health and Human Services are continuing to provide free water filters, free lead testing through the state laboratory for Flint water customers, and hiring additional staff to conduct health exposure monitoring for lead in drinking water.

Wednesday, Oct 21, 2015 @ 4:14pm By EP News Wire Reports

Michigan Department of Environmental Quality (DEQ) Director Dan Wyant issued a statement on Monday to address the mishandling of drinking water safety in Flint.

“As details of the situation emerge, I am convinced our program staff believed they were doing their job right,” Wyant said. “As the state recognized there could be a health threat to Flint residents, we took appropriate steps. We are now embarked on an unprecedented effort to safeguard Flint residents and families with near-term, intermediate and long-term actions to protect and educate city residents.”

Wyant said the staff employed a federal protocol they believed was appropriate, but was incorrect. "The water testing steps followed would have been correct for a city with less than 50,000 people, but not for a city of nearly 100,000," he said.

Wyant also announced that he has replaced the leadership in the DEQ’s Office of Drinking Water and Municipal Assistance, with DEQ Chief Deputy Jim Sygo serving as interim chief.

“The Governor has called for an independent, third-party after-action review,” Wyant said. “I have taken the step of changing leadership in the division. We are working with our federal partners and committed to being part of the U.S. EPA's effort to strengthen its Lead and Copper Rule…We will learn from this. We will make necessary changes to see to it that our program becomes a national leader in public health protection."

http://wdet.org/posts/2015/10/21/81790-michigan-congressman-wants-feds-to-investigate-flint-water-crisis/

Oct. 21, 2015

U.S. Rep. Dan Kildee wants the EPA to analyze how the Flint’s water supply was allowed to go so bad for so long.

A Michigan Congressman is calling for a federal investigation into why elevated levels of lead were allowed to seep into the City of Flint's water supply.

Flint officials are reconnecting to Detroit's water system after researchers found double, and sometimes triple, the amount of lead usually present in children living in the city.

But Michigan Congressman Dan Kildee, who represents Flint, is requesting that the U.S. Environmental Protection Agency investigate why state officials allowed residents to use water that many said smelled bad and looked funny.

Research now shows the water contained dangerous levels of lead for months.

Kildee writes that someone must be held accountable for the situation in order to "restore confidence and to ensure that these failures never happen again."

The head of the state Department of Environmental Quality says staff members used the wrong standards for judging the safety of Flint's drinking water.

Gov. Rick Snyder is also appointing a task force to review how water was tested in Flint and propose guidelines for future safeguards.

http://www.mlive.com/news/flint/index.ssf/2015/10/flint_administrator_says_city.html

By Ron Fonger | rfonger1@mlive.com
October 21, 2015 at 8:21 PM, updated October 21, 2015 at 11:23 PM

FLINT, MI — The city will conduct its own internal investigation of Flint's water crisis, City Administrator Natasha Henderson said Wednesday, Oct. 21.

Henderson told the City Council her planned review will include "the steps that were taken" since 2013, when officials decided to join the Karegnondi Water Authority.

In the following year, the city ended its use of Lake Huron water purchased from the Detroit water system and began using the Flint River as a drinking water source.

That river use is ending after elevated lead levels were found in Flint water and in the blood of infants and children since the switch occurred. Using money from the city, state and Charles Stewart Mott Foundation, the city reconnected to Detroit water last week.

"We will seek to commission an independent source to review the technical and operational steps that occurred from the time the city signed on to the KWA to present," Henderson said in a memorandum to Mayor Dayne Walling.

"This is meant to internally perform an after-action review in order to clearly assess the decisions that were made," the memo said.

The city administrator also told the council she plans to establish higher standards than required for the Flint water treatment plant, encourage all utility employees to become part of the American Water Works Association and be committed to more consistent meetings of Flint's Technical Advisory Committee.

The announcement of a local review of how Flint's water crisis occurred comes on the same day Gov. Rick Snyder announced a new task force to look at "actions regarding water use and testing in Flint" and to make recommendations for future guidelines.

State DEQ Director Dan Wyant said this week that his office should have required Flint to treat Flint River water to make it less corrosive but mistakenly did not.

Researchers and doctors have said the corrosive Flint River water caused increasing amounts of lead from service lines to leach into city water after the switch.

In addition to Snyder's announcement Wednesday, U.S. Rep. Dan Kildee, D-Flint, and state Senate Minority Leader Jim Ananich, D-Flint, asked the U.S. Environmental Protection Agency to investigate how Flint's lead-in-water crisis developed.

Henderson's plans, developed after a request from Walling, did not win over City Councilman Eric Mays, who said the council should investigate — with the power to subpoena and take testimony under oath.

Mays said the city also should have known it needed to add phosphorus to Flint River water to control corrosion, partly because a previous study indicated that.

By AP in the New York Times posted on Oct. 21, printed Oct. 22

Officials are asking the federal Environmental Protection Agency to answer questions about its oversight of state environmental regulators after elevated blood-lead levels were found in children whose Flint homes received river water. Representative Dan Kildee and the State Senate minority leader, Jim Ananich, both Democrats from the Flint area, said Wednesday that they had sent letters to the agency. Flint reconnected to Detroit's water system last week in hopes of resolving the health emergency. “It has become clear to me that unacceptable lead levels were a failure of government at every level,” Mr. Kildee wrote in a letter to the E.P.A. administrator, Gina McCarthy. He said the agency needed to conduct an investigation “to restore confidence and to ensure that these failures never happen again.” The agency said it was reviewing the request. Dan Wyant, director of the State Department of Environmental Quality, has said that federal drinking water rules were not followed properly when Flint switched from Detroit’s water system.

A version of this brief appears in print on October 22, 2015, on page A16 of the New York edition with the headline: Michigan: E.P.A. Investigation Is Sought Over Flint Water.

<hr size=2 width="100%" align=center>

http://www.macombdaily.com/article/MD/20151022/NEWS/151029889

Posted: 10/22/15, 7:16 AM EDT | Updated: 1 min ago

FLINT (AP) >> Gov. Rick Snyder has announced the creation of an independent advisory task force to review Flint’s water use and testing.

The group includes public health and medicine, water management and environmental protection experts.

Snyder’s office says Wednesday that the group also will offer recommendations for future guidelines to protect Michigan residents’ health and safety.

Flint stopped getting its water from Detroit’s system last year to save money. It started using Flint River water until a new system connecting to Lake Huron was completed.

Advertisement

Residents complained about the Flint River water. Doctors later discovered corrosive water was drawing lead from aging pipes in some homes.

Flint has since reconnected to Detroit’s system.

The state says federal drinking water rules were not followed properly when Flint switched to the river water.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well.

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard

corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at

least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

FLINT, MI -- A Detroit-area pastor who met with the director of the state Department of

Environmental Quality this week says he asked the director to resign because of state's role in Flint's water crisis.

The Rev. David A. Bullock said he and other members of the nonprofit Change Agent Consortium met with DEQ Director Dan Wyant Wednesday, Oct. 21, after a prayer vigil at the agency's headquarters.

"He definitely heard us out. He was able to hear from us, and that was important," Bullock said. "We were able to hear the plan going forward, and we were able to raise the question of his resigning."

Wyant issued a statement on the impromptu meeting with Change Aggent Consortium Thursday, Oct. 22, saying his office invited leaders to "discuss their concerns and share information transparently."

"I serve at the pleasure of the administration," Wyant said of the call for him to resign. "I believe the governor will gather all the facts and make the right decision at the appropriate time.

"Until then, we at the DEQ are singularly focused on implementing the state's plan to address lead issues in Flint and protect kids and families there."

Bullock is the pastor of Greater Saint Matthew Baptist Church in Highland Park. He and the Change Agenct Consortium, which organized the prayer vigil, have been active in Flint before.

One year ago, Bullock called for the removal of former emergency manager Darnell Earley while speaking in Flint.

Earlier this year, the group donated 500 cases of water to Flint families as the city struggled to keep down levels of total trihalomethanes (TTHM) in the city's water supply.

The CAC call for Wyant to step down because of the Flint lead-in-water emergency comes in the same week that the director announced he was replacing his top municipal drinking water official after acknowledging oversight mistakes with the Flint water system.

Wyant issued a written statement Monday, Oct. 19, saying the state enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make the water less corrosive.

Researchers and doctors have said the river water, used in Flint since April 2014, was far more corrosive than Lake Huron water that had been purchased for decades previously from the Detroit water system.

Because the river water was more corrosive water than lake water, it leached lead more quickly when it came in contact with lead service lines that bring water to about half of the homes in Flint.

In addition to elevated lead levels in water sampled by the city, a Hurley Medical Center doctor's study showed blood lead levels in children and infants in some parts of the city tripled after the change in water source.

On Friday, Oct. 16, the city switched back to Detroit-supplied water, using millions of dollars from the state and Charles Stewart Mott Foundation to make the change.

By Virginia Gordan • 1 hour ago – radio story on site

Credit Steve Carmody / Michigan Radio

US Rep. Dan Kildee, D-Flint Township, is calling on the U.S. Environmental Protection Agency to conduct a thorough investigation into what led to Flint's unsafe drinking water.

In a letter to EPA Administrator Gina McCarthy, Kildee seeks answers to questions about the adequacy of the EPA's oversight of the Michigan Department of Environmental Quality.

Kildee said both the EPA and the MDEQ gave repeated assurances that Flint's water was safe to consume, despite evidence that the water quality was unsafe.

Kildee said he is seeking transparency about what happened and accountability.

"The City of Flint residents should not be handed the bill for this massive failure of government at the state level and potentially at the federal level as well," said Kildee.

Kildee said the citizens of Flint are victims of the water crisis and should not have to pay to fix it.

Kildee has asked for a response from EPA Administrator McCarthy by October 27, 2015.

Oct 22, 2015

At this point in the history of our country, racial tensions seem incredibly high. If we look back, though, over the course of our history, it seems that tensions have been simmering for a long time, and maybe are just now boiling over again.

I don't pretend to know what to do about things like White Privilege. I understand what it means, but I am not a person who can just sit with an idea. I need a solution, or at least to be working toward one. But when I look at the statistics, the numbers of unarmed black men killed by police, say, or the fact that America has only 5 percent of the world's population but has nearly a quarter of those incarcerated in the world, most of those poor and not white; or the fact that even though drug use is about the same between white and black folks, but black folks are 10 times more likely to spend time in jail...

I watched a news story the other night on a kid I won't even give a name to. It was all about how he used this "affluenza" defense after he killed four people while driving drunk, all about how it wasn't the first time, and all about how the fact that he was from a wealthy family meant he never served time or got help. I think most of the people my age who live in this county probably know at least one person who has had some sort of alcohol offense, and I'm pretty sure that most of those people didn't end up with just a sentence of community service, but ended up with tens of thousands of dollars in fines and costs.

I am not in any way defending people who choose to drive after they've been drinking. My point is that the treatment of folks is not the same; our justice system is biased to the wealthy and the powerful, and those who can afford hot-shot attorneys with exorbitant fees.

Another example of our broken system is the water crisis in Flint. In 2014, the economically strapped city switched from the water supply out of Detroit and decided to draw water from the Flint River instead. Residents of Flint complained because the water had a terrible smell, because it looked awful. When fecal coliform bacteria was found in the water, the city dumped extra chlorine in, not realizing, apparently, that the water in the Flint River is especially corrosive and caused the pipes to leach lead into the water.

This is water that babies, elderly folks and people just like you and me drank. This is water that they cooked with and cleaned with and showered in.

Did you know that the cost of water received from the Detroit system costs the residents of the City of Flint almost three times more for their water than the City of Detroit and its suburbs?

I am pretty sure that something like fecal bacteria and lead in the water could not, would not happen in our pretty little towns. We would not allow it to happen; we would organize on social media and sign countless petitions online to send to our representatives. We would make phone calls and just generally create a stir.

Our systems of justice and our social systems make what happened in Flint, make the rate of blacks incarcerated for drugs, make the fact that many in our own county are choosing to pay bills or buy food and being warehoused in jails OK.

We are complicit in these systems because we remain silent. We tow our little bag of donated spaghetti sauce close to the door of our local church food pantry. We look the other way when we see people who need help right in front of us; and we allow things like the water crisis in Flint to happen.

I think that this says we believe people like those who live in Flint are somehow not important. It's somehow OK with us that little babies drink water so full of lead it can permanently damage their brains.

We can't blame all of this on our elected officials. They do work for us, though most seem to have forgotten that fact.

We need to blame ourselves for not being heard, for not stepping into the gap that is created between those who have and those who have not more often. Many times, folks have commented online that I should get out there and lead the charge — if you knew me, you would know that I do, that I am. And part of that is to ask you to charge along with me.

If you would like to help the City of Flint as they struggle through its water crisis, its "we cannot drink the water" crisis, you can. You can go online and find a church or social organization and donate to them. You can drive over and pass out bottled water.

Much like the refrain of my last column, of my last 12 columns (happy anniversary!), I am asking you to help. If we all budged just a little bit from the views we hold and the things we think are worthy, we really could change the world.

— By Alicia Hager, Tribune community columnist

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well.

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. *Flint will conduct additional testing for lead to assess potential exposure and sources at the 25 LCR sampling locations. [seems like this misses what you were saying, Darren]* In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate [others?]*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard

corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at

least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. *Flint will conduct additional testing for lead to assess potential exposure and sources at the 25 LCR sampling locations. [seems like this misses what you were saying, Darren]* In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate [others?]*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Lastly, we discussed additional lead drinking water monitoring Flint should do to better assess lead exposure, determine effectiveness of water source change and corrosion control, and identify lead sources. That discussion does not appear to be captured here.

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Lastly, we discussed additional lead drinking water monitoring Flint should do to better assess lead exposure, determine effectiveness of water source change and corrosion control, and identify lead sources. That discussion does not appear to be captured here.

Subject: RE: Flint WTP PH2 SEG4 - Corrosion Control

Mike,

Thank-you for giving us the opportunity to review the city of Flint's corrosion control plan.

We believe it is necessary that Flint boosts orthophosphate dosage. Given that the distribution system has not received orthophosphate in over a year, we expect that orthophosphate will need to be boosted to 1) meet the demand of the distribution system, 2) reach the service lines and other lead-containing components in premise plumbing, and 3) accelerate lead reduction at the consumer's taps. Orthophosphate should preferably be added in the same form as the Detroit source which is phosphoric acid from our understanding. This is the proposed case here, however, a simple test should be performed to make sure that the pH is not impacted in a significant way at the desired target dose.

We have not been able to obtain comprehensive water quality data for the finished water characteristics of the Detroit water that will be fed to Flint, to assess ranges of major chemical characteristic fluctuations. However, based upon the email trail, Detroit water entering the Flint system appears to only contain around 0.4 PO4/L. This concentration range is entirely too low compared to that needed in studies presented and published in the last 20+ years that have focused on lead released directly from lead pipes, and the solubility of the most likely lead orthophosphate pipes scales. We also strongly feel that targeted dose of 0.8 mg PO4/L is also too low, for the very same reason. We would be glad to share with you numerous standard corrosion control and treatment reference works, best practices guides and published results from US and international lead corrosion control field and pilot studies. Secondly, the basis for that target (other communities using Lake Huron source use the same dose) is not scientifically derived nor does it consider water quality and the current state of Flint's distribution system. We have reviewed the original Detroit corrosion study and have seen some of the LCR monitoring data, and besides the fact that it did not directly pertain to this water source, few dosages were tested in the cited 1994 pipe loop study, and the higher dosage than the one implemented in the field currently was more effective. Based on the limited amount of data on the quality of Detroit water, what we know about the history of Detroit corrosion control, we think an orthophosphate residual of 3 to 4 mg PO4/L should be the minimum starting test target residual for pipe passivation. It is likely that, at least initially a higher dosage will be necessary to reach the far ends of the distribution system and sufficiently reduce lead solubility and release from all lead sources. To allow flexibility, we feel the design of the chemical feed and storage systems should be able to consistently deliver a maximum dose of 5 to 6 mg PO4/L, if substantial orthophosphate loss is observed, if the starting dose is set for the desired residual level of 3 to 4 mg/L as PO4. We suggest that jar tests be performed in advance of orthophosphate addition to Detroit water to evaluate the impact of orthophosphate dose on turbidity that could result from interactions between orthophosphate and background Detroit water quality parameters (e.g., aluminum, calcium, etc.).

We want to stress that immediately shifting to Detroit water and adding orthophosphate will not necessarily translate to immediate improvements. Furthermore, this is a change, albeit a return to past conditions. Nonetheless, a period of system upset should be anticipated. The need for a communication strategy and a distribution system plan are critical.

Lastly, we see no mention of a water quality monitoring program. Two programs need to be put in place immediately (before return to Detroit water) to 1) identify lead sources, 2) assess treatment effectiveness against lead release from all of the simultaneously operating mechanisms (solubility, particulate release, galvanic corrosion), and 3) assess orthophosphate levels and stability of water quality in the distribution system.

There are multiple sources of lead in the Flint distribution system to the consumers' taps, such as: pipes; leaded brass; leaded solder; accumulations on old galvanized steel pipes; possibly accumulated on copper or some plastic pipes. It is critical that the fate of orthophosphate in the distribution system is understood, and how effective it is against each type of lead source, so dosing adjustment can be properly made. For this purpose, we recommend that a number of residences throughout Flint that meet the following plumbing criteria, be identified for an assessment of the contribution lead from the different potential service line and interior plumbing sources, through detailed mapping of plumbing materials, lengths, sizes, and location and type of inline devices and faucets using profile sampling. For confidence in interpretation, probably at least 5 sites from each of the configurations will be necessary. The configurations we would estimate to be most important (but should be changed or added to if local construction practice indicates it's necessary): Lead service line, galvanized steel interior plumbing; lead service line, copper with leaded solder joints; lead service line, plastic interior plumbing. It is also possible that interior plumbing may differ from the material used for the customer-side service line segment. We would be glad to discuss the specifics of this sampling effort.

For the purpose of assessing stability of water quality in the distribution system and to inform on orthophosphate residual adjustment, we suggest that 8 to 10 locations in the distribution system be selected to measure pH, alkalinity, orthophosphate, turbidity and iron on a weekly basis. These could be collected from TCR sampling locations, or other readily-accessible buildings, should be located at a distribution of locations in the distribution system and should be collected after a flush sufficiently long to assure that "fresh" distribution system water is being measured. Research has shown that over time, orthophosphate can reduce disinfectant demand associated with corroding metallic distribution system materials. These measurements need to be performed in the field and can simply be done with a portable HACH test kit or spectrophotometer.

A lead sampling plan needs to be in place to access the effectiveness of water change and treatment boost. LCR monitoring sites with confirmed lead service lines can be in the sampling pool. Sampling should consist of a 1 liter first draw sample (LCR sample without 5 minute pre-flush), followed by an additional flushed sample or two depending on profile sample results which is intended to capture major lead source(s). The specific details of this effort need to be worked out by the technical committee as soon as possible. We would gladly work with Flint on establishing a water sampling program to identity and verify lead service line sites. The plan and initial sampling effort should be performed before the switch so that one baseline sample set is collected.

Lastly, our strength does not fall under full-scale pump and chemical feed delivery systems. We would only say that the systems need to be scaled-up in size to accommodate our suggested dosing needs. Also, there is the some discussion about diverting water to the Dort reservoir and an associated orthophosphate feed system. We are not familiar with the reservoir but are wondering if it is an open reservoir?

Of course this is a lot of information to share and we would gladly be available to discuss the technical and scientific basis for our suggestions.

Let us know if you have any questions and thanks again,

Darren and Mike

Subject: Flint WTP PH2 SEG4 - Corrosion Control

Hi Mike,

Please see attached plans for the Corrosion Control Plan for the City of Flint. I will have the official submittal package to you tomorrow afternoon after I get Brent or Mike's signature on the permit application. I will call you when I get back in Lansing to drop the package. Is three sets of full size plans adequate? Would you like some half size plans? Let me know.

Basis of Design

Given that Flint will require lead and copper corrosion control and given that Detroit utilizes orthophosphate for their corrosion control methodology, and that Flint will be receiving Detroit water for the immediate future, orthophosphate is the appropriate corrosion control methodology for Flint. A dosage of 0.8 mg/l as PO_4 has been recommended for the Detroit water. Numerous utilities utilizing Lake Michigan water have a target dosage of 0.9 mg/l as PO_4. Therefore, a target dosage in the range of 0.8 to 0.9 mg/l appears appropriate.

It is expected that, at least initially, there will be a significant PO_4 demand in the system. This will require a significantly higher dosage until this demand is satisfied and the target residual can be maintained. We are therefore designing for capability of a maximum dosage of 1.5 mg/l.

The arriving Detroit water will likely have some residual PO_4 when it arrives at Flint. It has been reported that this residual will be approximately 0.4 mg/l. The system must therefore be capable of a minimum dosage of 0.4 mg/l.

Based upon the usage of 75% Phosphoric Acid and a flow range of 4 MGD to 25 MGD, with an average day of 16 MGD, the expected feed rate will be 1.35 to 32 gpd. Average Phosphoric Acid feed is expected to be 10.8 gpd, requiring 30 days storage of 325 gal.

Orthophosphate will need to be applied at two locations. Detroit water will enter the Flint system at Control Station CS2, and supplementary phosphate will be applied there. However, on occasion some incoming water may need to be diverted to the Dort Reservoir, bypassing CS2. This water would then be introduced to the system through High Service Pump Station PS4 and phosphate would be introduced at this location.

Please let me know if the information is adequate or you require additional information.

Thanks.

DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Lastly, we discussed additional lead drinking water monitoring Flint should do to better assess lead exposure, determine effectiveness of water source change and corrosion control, and identify lead sources. That discussion does not appear to be captured here.

Subject: Re: Recommended response to DEQ re: Flint WTP PH2 SEG4 - Corrosion Control

Sorry for not responding, I left early yesterday. Below are my comments for the group's consideration.

1) Has anyone evaluated where the water quality parameter monitoring is being conducted by Flint? If not, we might want to do that to make sure that the sites selected are representattive of the water quality throughout the city. My concern is that the chlorine residual range reported by the City in their October 2015 water quality report is given as 0.2 – 4.0(https://www.cityofflint.com/public-works/utilitieswater/water-treatment-plant/).However, we know that in at least one area of the city, even after flushing the tap for 8 hours, there was no detectable chlorine residudal. Repeated tests over 18 days (last one was September 3) show the same. These measurements were done after the replacement of the old service line, so the chlorine is not getting to this area (http://flintwaterstudy.org/information-for-flint-residents/chlorine-monitoring-in-flint-resident-ms-leeanne-walters-home/)

2) The recommendations in the final report on the sampling we did in Flint are linked to the corrosion control treatment. The lead concentrations in the scale/sediment are orders of magnitude higher that what we typically see in drinking water samples, so I think from a risk perspective, we need to better understand the composition and stability of the scales withn the pipes to to assess the stability of the scales and inform the treatment. Although the release of scale/sediment is not unique to Flint, the dislodging of scale/sediment would pose the greatest risk to residents by far. Our final report will be posted in the near future so should we include the assessment sampling in our comments on corrosion control (see below)?

Recommendations

As indicated by the results from the Citizen name / Ex. 6 home and previous EPA work, the presence of lead pipes over many years has likely resulted in the accumulation of lead in the scales within non-lead pipes downstream of the lead pipe and physical disturbances to the leaded or non-leaded portions of the service lines have the potential to release large amounts of scale and sediment that could pose an immediate and acute health hazard to the residents. Consequently, even with corrosion control treatment in place in the future, physical disturbances will be capable of dislodging the high lead-bearing scale and sediment from non-lead pipes as well as lead pipes, as was the case in the earlier EPA study.

Obtaining information on the lead reservoirs in the scales within the lead and non-leaded portions of intact service lines is essential for determining the potential risk to residents from lead-bearing scale released as lead lines are replaced as well as the risk that may remain following removal of the lead lines, where the non-leaded portions of service lines are left in place.

As the Citizen name / Ex. 6 service line was very long compared to the length of most typical service lines, it is important to assess the potential risk posed by the scale reservoirs in more typical lengths of service lines by extracting both the leaded and non-leaded portions of service lines which have not been physically disturbed. The service lines chosen for extraction and analysis should be representative of the materials commonly used downstream of the lead pipe (e.g., galvanized iron, copper, plastic). Extraction/handling procedures should be developed by EPA to ensure that damage to the scales from the excavation, extraction and delivery of the service line segments is minimized. Sequential sampling should also be conducted on a representative group of homes with common plumbing materials (e.g., galvanized iron, copper, plastic) to determine the extent to which the lead from the service line has seeded the interior plumbing in homes.

It is also critically important to develop and incorporate ongoing training and public education on the potential for high lead release from the scales as a result of any future physical disturbances to service lines and mitigative actions that residents can take to lower their exposure risk. The training and educational material should be assessed for clarity, meaningfulness, and accessibility by a group of residents and health experts to ensure the effectiveness of the communications.

At a minimum, immediate training and public education on the potential risks posed by physical disturbances to service lines should be developed by communications experts and provided to residents, community groups, elected officials, health departments, pediatricians and gynecologists, water and non-water utilities (gas, electric, cable, etc.), plumbing organizations and contractors. Residents should be notified of scheduled work by water and non-water utilities and informed of the potential risk of increased lead levels due to these disturbances.

Subject: Recommended response to DEQ re: Flint WTP PH2 SEG4 - Corrosion Control

Bob – below is a response we recommend you send to Jim.

++

Jim – the following includes a couple of changes (in red italics) that we feel need to be incorporated into the text to reflect our earlier comments (from Mike and Darren) and the subsequent call. Additionally there is a recommendation at the very end that was discussed but not incorporated into the writeup you sent, which we also feel should be incorporated. Please feel free to get back with us if you have any questions. Otherwise we appreciate the opportunity to provide input and your willingness to address our comments.

- Bob

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Lastly, we discussed additional lead drinking water monitoring Flint should do to better assess lead exposure, determine effectiveness of water source change and corrosion control, and identify lead sources. That discussion does not appear to be captured here.

LANSING — Michigan's emergency manager law, already highly controversial because it was rejected by voters in 2012 but reinstated by Republican lawmakers less than six weeks later, is under fresh scrutiny in light of the lead contamination of Flint's drinking water.

Flint was under the control of a state-appointed emergency manager when it began drawing water from the Flint River as a cost-saving measure last year. Tests show the corrosive nature of the river water caused lead in the pipes that deliver it to homes and other structures to leach into the drinking water, causing it to exceed federal limits for lead — which can cause permanent brain damage in children.

There's now universal agreement that the city's switch to Flint River water was a mistake without necessary safeguards, such as adding anticorrosion materials to the water before it was pumped to homes through the lead pipes to help prevent leaching.

But there's no consensus about whether the bad choice was one that could have been made by elected leaders in any cash-strapped city, or whether the Flint debacle is an indictment of Public Act 436, which Gov. Rick Snyder signed into law in December 2012, just weeks after voters rejected its earlier incarnation, Public Act 4 of 2011.

Snyder and other proponents said the revamped law gave financially distressed cities more options, control and financial support. Critics, including the Stand up for Democracy group that worked to repeal the earlier law, said it was an equally onerous example of state overreach.

Eric Scorsone, an extension specialist in the state and local government program at Michigan State University and an expert in public finance issues, said there's greater risk under an emergency manager that decisions could be taken that sacrifice other important considerations to the bottom line. But he said what happened in Flint does not mean the EM law is a bad statute that must be repealed.

"I think it's more about government leaders in general have to be careful when we're in a cost-cutting mode," whether dealing with water or services such as police and fire protection, he said. "You have to pay the bills, but you also have to ask yourself how far can you go before you start to endanger public health."

Elsewhere in Michigan, the use of emergency managers has been a mixed bag, with Allen Park, Benton Harbor and Flint — with the exception of the water crisis — being among the more successful examples, and Ecorse and Highland Park among the less successful ones, Scorsone said.

Though no problem has been more glaring than the one in Flint, other decisions made by emergency managers have been criticized, such as the decision in Pontiac to sell the Silverdome, the former home of the Detroit Lions, for $583,000 in 2009. The investors who bought it said in 2014 they want to sell it for $30 million.

"In hindsight, it seems way too cheap right now," Wayne Workman, Michigan's deputy treasurer for local government services, said of the 2009 sale. But "the city was bleeding. ... It was time to get some liquidity," and the facility had an annual maintenance cost of $1.5 million. "It was not going to make any money for the city for a long, long time."

Scorsone said the use of EMs has generally been more successful in cities than it has been in school districts, such as Detroit Public Schools, where the nature of school funding and the fact students can easily leave for other school districts make for problems much more difficult for EMs to handle.

"I think what (the Flint situation) points out is the implementation of this ... has to be carefully balanced," Scorsone said. "There could be a tendency to go with cost savings plans that are not always thought out as well as they should be.

"It's easy to Monday morning quarterback," but "this needs to be a lesson for government leaders in general. I don't think it's an indictment of the law, per se."

Flint, which is now under a transition advisory board as an interim step toward return to local control, was placed in receivership under an emergency manager appointed by Snyder in 2011. The city, which had previously purchased Lake Huron water through the Detroit Water and Sewerage Department, began drawing its water from the Flint River in April 2014. The city stuck with the river water despite months of complaints from residents about the poor taste and color of the water, among other concerns. It reconnected to the Detroit system on Oct. 16.

Snyder and other state officials have noted that Flint Mayor Dayne Walling and the Flint City Council backed the 2013 decision to split with DWSD and move to the planned Karegnondi Water Authority, which will also draw water from Lake Huron through a pipeline that is still under construction.

"The unfortunate situation in Flint is in no way an indictment ... of Public Act 436, the Local Financial Stability and Choice Act," said Terry Stanton, a spokesman for the Treasury Department.

"This is not a situation where the mayor and council wanted to utilize one system with the EM reversing course," Stanton said. "All involved in the decision-making process agreed KWA was the best long-term option for the city of Flint."

When Flint notified Detroit in April 2013 that it had opted to switch to the Karegnondi Water Authority, Detroit gave it one year's notice that it was terminating its contract to supply Flint with Lake Huron drinking water. Detroit's decision to cut Flint off before the Karegnondi pipeline to Lake Huron would be completed — a decision made one month after Detroit was placed under the control of its own former emergency manager, Kevyn Orr — is what precipitated Flint's move to the Flint River as a drinking water source pending completion of its own water provider.

Walling, who takes ownership of the decision to switch to the Karegnondi Water

Authority, told the Flint Journal he had no direct involvement in the decision to draw drinking water from the Flint River.

A March 7, 2014, letter from then-Flint emergency manager Darnell Earley to the DWSD, obtained by the ACLU of Michigan, shows Earley declined the DWSD's offer to continue selling water to Flint after the termination of the contract in April of 2014, saying "the Flint Water Treatment Plant will be fully operational and capable of treating Flint River water prior to the date of termination."

State Senate Minority Leader Jim Ananich, D-Flint, said the decision to draw drinking water from the Flint River, which was conditional on oversight by the Michigan Department of Environmental Quality, "was during a period of an emergency manager, and there weren't many decisions that were allowed to be made by local officials."

Senate Minority Leader Jim Ananich, D-Flint (Photo: Detroit Free Press file photo)
"Definitely, we need to look at the emergency manager laws and make sure there is some accountability," Ananich said. "They shouldn't be leaving cities with such crises."

Earley is now the emergency manager of Detroit Public Schools.

Snyder told the Free Press he doesn't necessarily think the Flint water crisis is a knock against the emergency manager law and said the issues are under review. He said the use of the law has clearly been successful in other Michigan municipalities, including Detroit.

Lonnie Scott, executive director of the liberal group Progress Michigan, disagrees.

In Flint, "the decision was made based on the bottom line and trying to save money," Scott said of the move to Flint River drinking water.

"An elected official, if you have a problem in your district, people are coming up and complaining and talking to you, you take care of that issue. An EM doesn't have that accountability," Scott said.

"The emergency managers are accountable to no one but the governor, so they don't care."

Workman said the law is "meeting expectations," and "I honestly feel feel good about the EM process in Michigan."

Critics don't isolate mistakes made by mayors and city councils to condemn that form of municipal government and, likewise, the incident in Flint should not be looked at in isolation to condemn the use of emergency managers, Workman said.

It's significant that in recent years Michigan had six cities under emergency managers, and that is now down to one, in Lincoln Park, Workman said.

"It's given us the tools that we need in some pretty dire situations," he said. "Right now, I don't foresee the need for the next emergency manager."

Scorsone, the MSU expert, said Orr's restructuring work as an emergency manager in Detroit made the Chapter 9 municipal bankruptcy of Detroit's largest city much smoother than it would have been otherwise.

Legislature, feds should take on Flint water investigation (MLive)

http://www.mlive.com/opinion/flint/index.ssf/2015/10/flint_water ed_jim_ananich.html

By MLive/Flint Journal opinion
on October 25, 2015 at 5:50 AM

The following is a guest opinion column for The Flint Journal.

By state Sen. Jim Ananich

Switching to the Detroit Water and Sewerage Department isn't the final solution for Flint — it's the first step on a long road to recovery.

Expert assistance is essential. Unfortunately, the Michigan Department of Environment Quality (MDEQ) cannot perform an investigation we can all trust. As such, I've sent a letter to the EPA and to the Auditor General requesting an accurate and thorough investigation to determine whether the misapplication of federal water testing rules was intentional or due to negligence. Their results must be transparent and easy to understand.

It's also crucial that individuals are held accountable for the damage done to the children of my community. And the best way we can do that and start restoring Flint's trust in our state government is to initiate a stringent legislative investigation and oversight process. For far too long the Michigan Legislature has ceded its power to the governor's office, failing to perform meaningful oversight. That's how systemic problems like the MDEQ's failings fester.

I welcome a third-party examination of the MDEQ's mishandling of Flint's water. At the same time, it's imperative the Legislature and federal authorities perform tough examinations. We cannot rely on a single task force appointed by Governor Snyder to get the job done, especially when that task force does not have clearly stated goals designed to root out systemic, departmental failures.

We have to push state officials to finish the fix, ask hard questions, and lay out exactly what needs to be done.

In addition, these individuals may be able to make policy recommendations to ensure these mistakes never happen again, but they likely lack the investigative background to hold individuals fully accountable for this public health crisis.

Last Wednesday, I suggested the governor ask former U.S. Senator Carl Levin to get involved in any investigation. Sen. Levin served as the chair of the Permanent Subcommittee on Investigations during his tenure in the Senate, in addition to a number of other government oversight subcommittees.

I cannot think of an individual better suited to restoring trust in our state government and getting to the bottom of this crisis.

We have to push state officials to finish the fix, ask hard questions, and lay out exactly what needs to be done to get the Flint community the answers they deserve. We also have to keep testing the water used in our schools. Schools are supposed to be safe havens for our children, not places where they might be subject to irreparable brain damage.

Lastly, we need to keep delivering filters and bottled water to those in need, particularly to those who may be housebound or unable to make regular distribution hours. We should not place the burden of obtaining clean water on residents; the state has to step up and provide access to what is a basic right.

We have the opportunity to examine the flaws in our drinking water infrastructure statewide. Our pipes, much like our bridges and roads, weren't built to last forever, and we can't let their maintenance bankrupt local municipalities or harm our citizens. If the Legislature acts swiftly and authoritatively, we can find solutions to ensure Michiganders have clean drinking water now — and in the future.

Jim Ananich is a state Senator representing Michigan's 27th District, which includes the city of Flint. He can be reached at senjananich@senate.mi.gov or find him on Twitter.

Michigan health officials scramble to help lead-poisoned Flint (USA

TODAY/Detroit Free Press)

http://www.usatoday.com/story/news/nation-now/2015/10/25/lead-poisoning-flint-water/74599112/

USA Today Network Robin Erb, Detroit Free Press 6:18 p.m. EDT October 25, 2015

FLINT, Mich. -- To the panicked parents in Flint: Help is on the way.

That's the message from doctors, university researchers and public health officials mobilizing to move an embattled city beyond shock and anger over its toxic water to a brighter next chapter — one that involves wrapping services around Flint's children to protect them from the worst effects of the lead that streamed through the city's water lines.

"This is somewhat of an unprecedented situation. Usually when we talk about elevated blood-lead levels, it's about an individual child or an individual family situation. Here you have a large, communal source of lead," said Dr. Dean Sienko, associate dean for public health at Michigan State University's College of Human Medicine, which is helping lead the effort.

While lead poisoning cannot be reversed, experts say that the right kind of nutrition, parenting and community services can mitigate the worst damage: learning disabilities, speech deficits and severe behavior problems in the coming years.

With guidance, in part, from a group known as the Flint Lead INnovation Team, the Michigan Department of Health and Human Services is expected to send letters this week to families recommending they talk to their child's doctor about immediate lead testing and long-term monitoring for developmental problems, as well as focusing on nutrition, since certain foods can reduce the absorption of lead.

Among other steps under discussion:

--Move local nutritionists and dietitians to pediatric offices and health clinics.

--Develop a phone app for Flint residents that would remind them of the importance of screening and even promote healthy recipes.

--Boost enrollment in federal programs such as Women, Infants, and Children (WIC) and Double Up Food Bucks, which give low-income families access to fresh produce.

--Increase aggressive screening to monitor kids for developmental delays, launch school-based stress-reduction programs and boost enrollment in Early Head Start and Head Start programs to give kids who may struggle with learning disabilities an academic boost before they start school.

--Expand home visiting programs in which health care and social workers meet with families, in part, to monitor children for developing learning disabilities or mental health issues.

The crisis came about as a result of Flint officials ending the city's water contract with Detroit in 2014, saying costs were too high and opting instead to join the Karegnondi Water Authority, which is building a system to supply Genesee County with water from Lake Huron. But with that system not coming on line until next year, Flint decided in the interim to pull water from the Flint River and treat it at its own facility. Complaints began almost immediately; last month, research by Dr. Mona Hanna-Attisha, a Hurley Children's Center pediatrician, showed a dangerous spike in children's blood-lead levels, corroborating water testing results earlier this year by a Virginia Tech researcher.

Mona Hanna-Attisha, MD, MPH program director for the pediatric residency at the Hurley Children's Hospital at Hurley Medical Center in Flint discusses how her research showed that the percentage of children with elevated blood-lead levels in some Flint ZIP codes nearly doubled since the city began to draw its water from the Flint River. (Photo: Ryan Garza, Detroit Free Press)

Amid accusations of a failure to properly treat the water and a cover-up, Flint reconnected to the Detroit water system a week ago. But it may take a few weeks to completely flush the system.

"We need to give parents hope, and we can do that," said Hanna-Attisha, who is now also helping lead a team of doctors and researchers. "We need to help them build resilience for their kids."

Just down the hallway from Hanna-Attisha's office in the new, colorfully bright Hurley clinic in downtown, Janika Owens and Demario Stewart last week carried in their 2-month-old son, Damonei, for a routine checkup. He was measured and weighed. Medical staff checked to make sure bones and organs are developing normally, even though lead poisoning's effects won't show up this early.

That leaves Damonei's parents wondering.

Although they've used bottled water for his formula, Owens at times had cooked with Flint water while she was pregnant. She'd brushed her teeth with it.

Lead can pass across the placenta to a fetus, studies have shown.

Who would ever think you couldn't trust — of all things — water?

"I never thought I'd have to deal with this — ever," Demario Stewart said, trying to soothe his increasingly wriggly infant. "Ill never trust my water again."

Hanna-Attisha says she has seen parents streaming in almost every day in recent weeks — parents who wonder how much lead their children have ingested. And about whether their child has irreparable brain damage. And whether it will one day trigger the kind of learning or behavior problems that can set a life permanently off course.

"They wonder: 'Did I protect my baby?' 'Did I trust too much?' " she said.

It's a grinding, toxic stress that finds access points in everyday inconveniences. Is the restaurant coffee made from Flint River water? Are the filters on the public drinking fountains adequate? Will the babysitter be as vigilant in getting bottled water? Is this a passing headache, or something more permanent?

Last week, Kaden Kyger's tiny fingers and face were slathered in strawberry yogurt as the toddler chased the family cats around the living room of their home. His mother believes he has been spared from lead poisoning because she used bottled water for his formula and she cooked using filtered tap water.

But then again...

The filter is getting old, June Kyger, 25, notes. When should she get a new one? She has heard there are free filters, but who has the best ones?

And what about lead testing for 16-month old Kaden? Who does that testing?

June Kyger, 25, of Flint holds her 16-month son, Kaden Kyger, while talking about their concerns about using Flint's water at her home in the south side Flint on Thursday, Oct. 22, 2015. (Photo: Ryan Garza, Detroit Free Press)

He seems fine — but then again...

The worries "every single day" are compounded by a sense of helplessness, said Kyger, who moved back to Flint earlier this year after several years away: "I don't really know my way around (city services) like I used to."

And some parents still aren't aware of the problem at all. Or they don't know help is available.

For every two clients served in the WIC program, it's estimated there is another eligible client who is not enrolled, said Mark Valacak, Genesee County's health officer.

"We have some very hard-to-reach populations," he said.

'Very, very unusual'

There's a symbiosis in this kind of public health initiative, too.

As researchers and doctors help residents navigate the years ahead, they will gather information from medical exams, cord blood testing of newborns, a review of low-weight births and miscarriages, results of water testing and geo-mapping of the hardest-hit areas. And that, in turn, will guide future public health efforts.

"What has happened in Flint is very, very unusual. They have essentially conducted an uncontrolled experiment, in that they corroded the heck out of these ... lead pipes," said Wayne State University lead expert Shawn McElmurry, who last weekend was in Flint testing water in homes just 48 hours after the city switched back to Detroit water.

Secondary to helping Flint's residents, Flint's crisis can offer important lessons to other cities relying on aging infrastructure, he said.

Testing over the coming years will offer insight into how well "the infrastructure recovers."

All of this, though, will take work to shift the conversation from finger-pointing to something more productive, said Jeffrey Dwyer, a senior associate dean at MSU's College of Human Medicine, which already was positioned in Flint to work with the community. Funded by a $9-million grant from the Charles Stewart Mott Foundation, its researchers are focused on the public health problems that Flint residents identified as their most pressing: chronic disease, behavioral health and healthy behaviors.

Let others call for the investigations when it comes to the water issues, Dwyer said — for public health, the most immediate task is buffering Flint's families from the worst effects of lead.

"We can all do the finger-pointing, but at the end of the day, there are people who need our help, and we have an obligation to figure out how to provide that," he said.

Let’s find a clean water solution for Michigan (Detroit News)

http://www.detroitnews.com/story/opinion/2015/10/25/find-clean-water-solution-michigan/74545540/

12:14 a.m. EDT October 25, 2015

It was great to see the Michigan Legislature come together and put politics aside as they voted unanimously in finding a resolution to the Flint drinking water crisis. However, this single incident also exposed a major flaw in a system that should ensure that all residents of Michigan have access to clean drinking water, not water that is treated from polluted rivers and is brought to them through aging, deteriorating pipes.

We have witnessed how difficult it has been for our state leaders to legislate changes in the way we fund roads. It is going to be even more difficult to bring about positive legislation to update our aging underground drinking water systems and failing sewer systems. We all take for granted that our water supply and sewage disposal systems are in fine working condition, and yet significant troubles lurk just below the surface in many, if not most, communities across the state. The delay in road funding has blemished the image of the state that put the world on wheels. A continued delay in proper funding for our underground infrastructure will also be an embarrassing black eye for the Great Lakes State, whose greatest natural resource is the water in our lakes, rivers and streams.

Flint is not alone with its aging and dilapidated system challenges. Other municipalities throughout Michigan have significant problems, and no one is talking about them publicly, in most cases. Pictures of many drinking water delivery pipes, which can range from 50-100 years old, would horrify most people. Many would be sickened if they truly understood that most of the beach closings that happen in Michigan on a regular basis are the result of fecal contamination from sewer systems. Even more disheartening is the fact that with very little state and federal financial support, our underground infrastructure is paid for mainly at the local level, and cash-strapped municipalities have not been able to implement rate increases for much needed improvements.

How many more Flint catastrophes need to happen before we wake up and fix the problem? A comprehensive state plan is sorely needed now to begin the replacement of outdated and failing systems; and, more importantly, to properly fund our ailing underground infrastructure throughout our state. This will take cooperation from the public, as well as local and state leaders — now — not after another public health emergency.

Clean water is essential, but it costs money. Nothing is more important to life, and nothing is taken more for granted. The lesson of Flint has been painful and costly. Let’s find a solution.

Mike Nystrom

Questions on leadership emerge in Flint mayoral race (MLive)

http://www.mlive.com/news/flint/index.ssf/2015/10/leadership_q

Incumbent Mayor Dayne Walling answers questions as candidate Karen Weaver takes notes during a Flint mayoral candidate forum held Thursday, July 30, 2015 at the White Horse Tavern in Flint, just days before the primary election. *(MLive File Photo)*

By Gary Ridley | gridley@mlive.com
on October 25, 2015 at 5:03 AM, updated October 25, 2015 at 5:06 AM

FLINT, MI -- Leadership ability has been called into question for two people vying to lead a city in the midst of a crime epidemic, chronic unemployment and a drinking water crisis.

Incumbent Dayne Walling is attempting to retain his position as Flint mayor against newcomer Karen Weaver in the upcoming November election. Attacks have been waged on both candidates' ability to actually command a city that is attempting to incubate a revival and break the grip of rampant crime and economic calamity.

On one side, Weaver and her supporters have criticized Walling's handling of the decision to use the Flint River to provide drinking water to the city, which ended when it was discovered the switch caused elevated blood lead levels in some Flint children.

Meanwhile, Walling and his supporters have targeted Weaver's lack of public leadership experience, and her firing from a health center's managerial post.

Walling's time in office, which has been stippled with state-appointed emergency managers, has seen Flint routinely identified as one of the nation's most-violent cities and is in the center of a water crisis that has gained international attention.

"I believe it's a failure of leadership and broken trust," Weaver said of Walling's handling of the city's water emergency.

In 2014, the city ended its use of Lake Huron water purchased from the Detroit water system and began using the Flint River as a drinking water source.

That river use has ended after elevated lead levels were found in Flint water and in the blood of infants and children since the switch occurred. Using money from the city, state and Charles Stewart Mott Foundation, the city reconnected to Detroit water Oct. 16.

Walling has denied responsibility for the change and said the switch to the Flint River was done by then-emergency manager Darnell Earley. But it was Walling who pushed the button closing Flint's connection the Detroit water system and seemingly stood by the quality of the Flint River even as residents protested the dirty, stinking water coming out of some of their taps.

It's this apparent complicity that has drawn Walling the ire of protestors and Weaver. His opponent claims he should have been more vocal in opposition to the plan to use the river, despite the state takeover.

"When you know something is wrong, you should speak out," Weaver said. "I know there's an emergency manager, but it doesn't take your voice."

But Walling said he has been vocal in his opposition to some of the decisions made by the emergency managers. He said he was opposed to the switch to river water from the beginning and lobbied state leaders to provide a safe drinking water source for Flint residents.

"My opponent's accusations about raising my voice are wrong," Walling said, adding that he has a demanding, results-focused leadership style that he's used to help streamline and strategize the city's government.

Walling said he regularly raised his concerns on issues ranging from drinking water to cuts in the city police department with other key decision makers during the deliberation process, a fact his opponent wouldn't be aware of because she had no participation in Flint's governance prior to her decision to run for mayor.

It's his opponent's unfamiliarity with local politics that Walling has used to try and separate himself from Weaver during the campaign. He was routinely used phrases like "my opponent doesn't understand some of how these things work" during forums and public speaking opportunities in an attempt to highlight her lack of experience.

Weaver has challenged Walling's accusations, pointing to her experience in leadership roles during her professional career. But that experience isn't without its own controversy.

Throughout the campaign, Weaver has pointed to her position as director of behavioral services at Mott Children's Health Center to highlight her experience in managing a staff and a budget.

In 2010, Weaver filed a lawsuit against the health center, claiming that she was wrongfully discharged from her job because she threatened to testify against other health center leadership about billing practices and that she was a victim of age discrimination.

However, the health center contended it fired Weaver because she failed to improve the productivity goals for her department, according to court records.

Court records show that mental health specialists Weaver was tasked with overseeing were expected to see six clients per day. Under Weaver's leadership, the specialists were only visiting three per day.

The health center claimed Weaver was warned in February 2009 that a change of leadership would be made if there was no progress in her department and was even offered a change in positions, which she declined.

Productivity remained stagnant despite the intervention, according to court records.

Despite the health center's allegations, Weaver said she stands by her leadership experience at the facility.

"I'm not going to run from my record at Mott," Weaver said. "I stand by what I accomplished at Mott."

The lawsuit was eventually settled out of court. The terms of the settlement are not public due to a non-disclosure agreement.

Walling said the lawsuit will be addressed in radio ads from his campaign.

"My opponent's termination and lawsuit need to be considered by the public when they consider her professional experience," Walling said.

Voters head to the polls Nov. 3.

Tim;

I have a big reservation about the highlighted sentence. I haven't had a chance to talk to Darren about it yet. I know Miguel agrees with me on it. If this hasn't gone out yet, we need to discuss the certified laboratory issue.

Bob – below is a response we recommend you send to Jim.

+++

Jim – the following includes a couple of changes (in red italics) that we feel need to be incorporated into the text to reflect our earlier comments (from Mike and Darren) and the subsequent call. Additionally there is a recommendation at the very end that was discussed but not incorporated into the writeup you sent, which we also feel should be incorporated. Please feel free to get back with us if you have any questions. Otherwise we appreciate the opportunity to provide input and your willingness to address our comments.

- Bob

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. Any water analysis should occur at a certified laboratory.

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Lastly, we discussed additional lead drinking water monitoring Flint should do to better assess lead exposure, determine effectiveness of water source change and corrosion control, and identify lead sources. That discussion does not appear to be captured here.

Importance: High

Most of these suggestions are great, we (Darren and I) agree with the red text.

There is one sentence, however, with which we (myself, Miguel, Darren) have a strong disagreement. See yellow highlight. The sentence should be deleted.

While there is an SDWA legal reason why LCR and other regulatory compliance sample analysis needs to be done by a "certified" laboratory, there is no good reason why diagnostic testing and research studies must use a certified laboratory for analyses. There is no correlation between "quality" between certified and non-certified laboratories. Neither our own WSWRD laboratory or the Region 5 laboratory are "certified," but the analytical performance is of top quality. Similarly, university laboratories can give high quality results, given careful attention to good QA and methodological practices. Our laboratory, and other non-certified laboratories supporting research studies often employ even better and more accurate analytical techniques and more rigorous quality assurance standards.

So, requiring certified laboratories for research/diagnostic/assessment purposes increases costs, increases logistical burden, and does not result in any payoff in terms of improved data quality.

While there is an SDWA legal reason why LCR and other regulatory compliance sample analysis needs to be done by a "certified" laboratory, there is no good reason why diagnostic testing and research studies must use a certified laboratory for analyses. There is no correlation between "quality" between certified and non-certified laboratories. Neither our own WSWRD laboratory or the Region 5 laboratory are "certified," but the analytical performance is of top quality. Similarly, university laboratories can give high quality results, given careful attention to good QA and methodological practices. Our laboratory, and other non-certified laboratories supporting research studies often employ even better and more accurate analytical techniques and more rigorous quality assurance standards.

So, requiring certified laboratories for research/diagnostic/assessment purposes increases costs, increases logistical burden, and does not result in any payoff in terms of improved data quality.

Subject: Recommended response to DEQ re: Flint WTP PH2 SEG4 - Corrosion Control

Bob – below is a response we recommend you send to Jim.

++

Jim – the following includes a couple of changes (in red italics) that we feel need to be incorporated into the text to reflect our earlier comments (from Mike and Darren) and the subsequent call. Additionally there is a recommendation at the very end that was discussed but not incorporated into the writeup you sent, which we also feel should be incorporated. Please feel free to get back with us if you have any questions. Otherwise we appreciate the opportunity to provide input and your willingness to address our comments.

- Bob

This will summarize our phone conversation of 10/19 and provide clarification regarding the previous comments.

The City of Flint converted back to purchasing of Detroit Water and Sewerage Department water on Friday October 16, 2015. No indications of upset in the distribution system have been reported to date.

Detroit Water and Sewerage Department (DWSD) has confirmed the use of Innophos "Phosphoric Acid 75% Technical" product which is NSF Standard 60 certified with a maximum allowable feed rate of 13 mg/L as product.

The City of Flint will need to supply a similar phosphoric acid product, NSF Standard 60 approved with allowable maximum dosage.

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P

(1.2 mg/L as PO4) as well. *Flint will need to test to ensure that pH is not significantly affected at the PO4 target dosage.*

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

Flint will continue Water Quality Parameter Monitoring in accordance with the LCR at the same 25 distribution locations used under the Flint River. In addition 10 of these locations also serve as total coliform monitoring sites, including disinfectant residual, and Flint will be told to, for the purpose of assessing water stability, conduct water quality parameter monitoring *for pH, alkalinity, orthophosphate*, along with turbidity and iron sampling will be at these 10 locations on a weekly basis as suggested. This will also ensure that a minimum recommended pH levels are being maintained throughout the system.

EPA ORD staff will provide instructions to the City of Flint for creating test loops to help confirm effectiveness of the corrosion control treatment. This data will help in rebuilding public trust.

The County Health Department and MI Department of Health and Human Services will be conducting blood lead level testing of children in Flint. Children with elevated blood lead levels will be offered exposure assessments of their homes. These assessments should include the contribution of lead from service line and interior plumbing sources. Such diagnostic testing should help further substantiate the effectiveness of corrosion control treatment. Procedures recommended by EPA should be shared with the Michigan Department of Health and Human Services.

The University of Michigan in Ann Arbor had previously expressed interest in assisting the City of Flint. Both the Department of Civil and Environmental Engineering, and School of Public Health should be contacted to determine if that interest still exists with potential to assist in both test loop construction and monitoring, and exposure assessment monitoring in homes. ~~Any water analysis should occur at a certified laboratory.~~

The City will be required to complete a 6 month round of lead and copper compliance monitoring in the January – June 2016 period. The City continues to offer all residents a first draw lead sample collection and analysis. Any additional staggered monitoring suggestions should be brought before the City's Technical Advisory Committee.

Criteria for deeming the treatment optimized must be established as the LCR only requires compliance with the lead and copper Action Levels once this determination has been made.

The City of Flint is continuing to digitize service line index card records into a Geographic Information System to confirm the location of lead service lines. EPA can provide additional information to the City regarding a sampling procedure to verify lead service line sites.

The City's engineering consultant will need to evaluate KWA water in conjunction with the City of Flint treatment plant processes to determine any necessary adjustments in optimized corrosion control treatment prior to initiating service to customers. Full scale testing may not be feasible.

Lastly, we discussed additional lead drinking water monitoring Flint should do to better assess lead exposure, determine effectiveness of water source change and corrosion control, and identify lead sources. That discussion does not appear to be captured here.

Column: Don't blame EM for Flint water disaster (Detroit News)

http://www.detroitnews.com/story/opinion/2015/10/26/opinion-flint-water-disaster/74657458/

Darnell Earley 11:32 p.m. EDT October 26, 2015

It is critically important that the record be set straight about the decision-making and approval processes that led to Flint joining the Karegnondi Water Authority (KWA) with the use of Flint River water as the interim water supply. The fact is, the river has served and been used as the back-up supply for decades, and this was the rationale given to me by staff and Mayor Walling, who also serves as chairperson of the KWA board. Contrary to reports in the media and rhetoric being espoused by individuals, the decision was made at the local level, by local civic leaders.

The decision to separate from Detroit Water and Sewerage Department and go with the

KWA, which included the decision to pump Flint River water in the interim, were part of a long-term plan that was approved by Flint's mayor and confirmed by a City Council vote of 7-1 on March 25, 2013. This plan was presented to me when I was appointed as Flint emergency manager in October 2013 – a full seven months after the City Council's affirmative vote.

Genesee County Drain Commissioner Jeff Wright also made the affirmative vote by the City Council a necessary condition of joining the KWA, and applauded the decision in a March 26, 2013, news release, "… I have said from the beginning that this decision must be made by Flint's City Council and Mayor … I am glad that the residents of Flint were able to have their voices heard via their elected officials."

The mayor's approval of the plan and the subsequent near unanimous vote by City Council were in no way coerced, forced or demanded by the state, nor any emergency manager. Council's affirmative vote was supported and signed as an Executive Order by then-Emergency Manager Edward Kurtz on March 29, 2013. A subsequent order Kurtz signed on June 26, 2013, speaks specifically to "… upgrading of the Flint Water Plant to ready it to treat water from the Flint River to serve as the primary drinking water source for approximately two years and then converting to KWA delivered lake water."

When I began my term as emergency manager, it fell to me to oversee the implementation of the previously accepted and approved plans, as the DWSD terminated the contract with Flint in April 2014. It did not fall to me to question, second guess or invalidate the actions taken prior to my appointment.

At the time the decision was made there was no way to predict such an unfortunate outcome. I would also offer that had local leaders known then what they know now, parts of their decision may have been entirely different. What the City of Flint and the State of Michigan are now dealing with is the management of an unintended consequence resulting in a negative outcome from an otherwise sound public policy decision. There is no "blame" to affix on any emergency manager for that.

As the solutions are put into place to address the serious concerns at hand, I believe that everyone's attention should now turn toward another serious concern – what is being done in the long term to replace the aged and crumbling water distribution systems that exists throughout Flint and Genesee County, which was a major contributing factor to this serious issue in the first place.

I am a strong believer that the truth supported by fact speaks for itself. This was a local decision that was made by local civic leaders. Anyone who says otherwise is being disingenuous for whatever reason.

Darnell Earley formerly served as the emergency manager of Flint. He is currently the emergency manager of Detroit Public Schools.

Ex-emergency manager says local leaders made decision to use Flint River water (Mlive/Flint Journal)

http://www.mlive.com/news/flint/index.ssf/2015/10/ex-emergency_manager_says_loca.html

By Ron Fonger | rfonger1@mlive.com
on October 26, 2015 at 4:21 PM, updated October 26, 2015 at 9:56 PM

FLINT, MI -- The city has stopped using the Flint River as its drinking water source, but that hasn't ended the finger-pointing over who decided to use it in the first place.

Former emergency manager Darnell Earley said in a statement to The Flint Journal-MLive that "local civic leaders" — not the state — made the decision, which came to an abrupt end earlier this month as the city was reconnected to the Detroit water system.

Earley, who was Flint's emergency manager at the time of the switch, said Mayor Dayne Walling and the City Council in March 2013 approved a "long-term plan" that included joining the Karegnondi Water Authority and the temporary use of the river.

The resolution does not indicate support or opposition to using the river, but Earley said river water was part of the overall plan presented to him by Walling and other city staff when he started working in Flint in October 2013.

"Anyone who says otherwise is being disingenuous for whatever reason," Earley's statement said.

The city began treating river water in April 2014, ending decades of buying treated Lake Huron water from Detroit, but operators struggled to control bacteria, total trihalomethanes (TTHM) and lead levels for the 17 months that followed.

Gov. Rick Snyder eventually intervened, offering a plan for the city to reconnect to Detroit water, using city, state and grant funds.

Walling, who toasted the switch to the river in a ceremony at the time, called Earley's statement about responsibility for the decision "blatantly false," and City Council President Josh Freeman said it amounts to a "fairy tale."

"It was the state emergency manager who failed to reach an agreement with Detroit to deliver water on a short-term contract after they" terminated an expired contract with the city, Freeman said.

Earley was appointed by Snyder to run Flint seven months after the council's vote to join the KWA. That vote happened during the tenure of another emergency manager, Ed Kurtz.

The Flint Journal could not reach Kurtz for comment.

Days after the council vote to join the KWA, Kurtz signed a similar order and, in June 2013, signed a contract for engineering services aimed at turning river water into drinking water.

"The mayor's approval of the plan, and the subsequent near-unanimous vote by City Council were in no way coerced, forced or demanded by the state, not any emergency manger," Earley's statement said.

The Flint Journal-MLive could not reach Earley for further comment.

But Walling said Earley's contention is simply untrue.

"The (2013) resolution makes no mention of the river and the financial projections provided to myself and the City Council (at that time) clearly show the city paying for Detroit water until connecting to the new pipeline," Walling wrote in an email to The Journal.

Walling has said he privately objected to using the Flint River as a temporary water source but was supportive of the plan once it was decided by Kurtz.

FLINT SAFE DRINKING WATER TASK FORCE

US EPA is committed to working with our state and local partners to ensure a safe and reliable water supply for the residents of Flint, Michigan. To achieve this, the EPA Region 5 Administrator will establish a Task Force to provide the Agency's technical expertise through regular, but no less than weekly, conversations with designated officials* from MDEQ and the City of Flint to assist with developing and implementing a plan to secure water quality, including measures to optimize corrosion control. Task Force members will be available to consult with MDEQ and the City of Flint on site in Flint as needed. The Task Force will also coordinate as necessary with federal, state and local public health agencies to assist with protection of public health.

Specifically, the Task Force will provide technical assistance to the MDEQ and the City of Flint to reconnect the Flint system to a new source of drinking water (to be supplied by the Great Lakes Water Authority) and to optimize corrosion control for the Flint system, starting in October 2015. The Task Force will also provide technical assistance to the MDEQ and the City of Flint, as needed, in advance of and following connection of the Flint water system to a new source of drinking water (to be supplied by the Karegnondi Water Authority) and to optimize corrosion control for the Flint system, starting in 2016.

Composition of the Task Force

Region 5 Deputy Administrator Bob Kaplan, Chair

Office of Research and Development Scientist Darren Lytle

Office of Research and Development Scientist Michael Schock

Office of Water Lead and Copper Rule Technical Lead Jeff Kempic

Region 5 Water Division Deputy Director Tim Henry

Region 5 Water Division Drinking Water Section Chief Tom Poy

---

* The Governor will be asked to designate the MDEQ official; The Mayor will be asked to designate the Flint official.

By Steve Carmody • 19 hours ago

Listen at link

Flint, Michigan voters will elect a mayor next week. The main issue in the election centers on the city's drinking water.

Flint's problem-plagued drinking water is expected to play a significant role in next week's election for mayor.

Flint residents have been complaining for more than a year about the quality of their city's drinking water. Next month, many voters say they will cast their votes for mayor with those problems in mind.

Credit Steve Carmody / Michigan Radio

For more than a year, people in Flint have been holding protests about the city's tap water.

"There's some people in Flint, Michigan who don't believe this water is safe," Pastor Alfred Harris told a crowd at one protest at Flint city hall a few months back.

Along with complaints about rising lead levels and other problems, many have been calling for changes at city hall.

"It's time for us to stand up…speak up and tell this mayor to get out of town," Pastor Alan Overton urged the crowd at that same rally.

That's not what a man running for re-election wants to hear.

Dayne Walling has been Flint's mayor for six years. He's on the ballot again next week.

Flint Mayor Dayne Walling is seeking his third term. But complaints about the city's water may cost him votes in next week's election.

Credit Steve Carmody / Michigan Radio

Walling's drawn the wrath of many people in Flint for his highly visible role in the city's switch from Detroit water to the Flint River back in April of 2014. Walling pushed the button making the switch happen and later toasted with other city officials at Flint's water plant. He also repeatedly told Flint residents their tap water was "safe to drink."

It turns out it wasn't.

Walling now blames state and federal agencies for misleading him.

"None of what happened over the last 18 months should have took place," Walling says, "The water didn't meet the standards, because the MDEQ wasn't even applying the standards. So yes, I feel…used."

Tests have shown high lead levels in the drinking water in some people's homes and in the blood of many Flint children. Researchers believe the highly corrosive Flint River water is to blame. They claim the water is leeching lead from pipes.

Walling says this issue is "personal" to him, since he and his family were among those in Flint drinking the water.

He blames state appointed emergency managers for the switch to the Flint River.

Mayor Walling says he's pushing the governor's office to come up with tens of millions of dollars to repair the damage done to the city's pipes.

But that might not be enough to convince Flint voters to separate Walling from the decision to switch away from Detroit water.

Just down the street from city hall, a campaign worker for Walling's opponent in next week's election was recently busy working the phones.

Karen Weaver has made fixing Flint's drinking water problems a key plank in her campaign platform

"Good Morning, I'm calling from Friends of Karen Weaver," the woman would say as she left a message, "This is a friendly reminder call to thank you for supporting and voting for Karen Weaver in the coming November 3rd election."

This is Karen Weaver's first run for elected office. The Flint businesswoman emerged from a four person field to win a spot in next week's general election.

Flint's water problems have become the main focus of her campaign to unseat Walling.

Weaver says the mayor shouldn't blame the city's water problems exclusively on emergency managers appointed by the governor.

"If everything was the emergency manager, why didn't you say that before?" asks Karen Weaver, "Why didn't you say this wasn't my idea before. But now all of a sudden you want to say what you think you need to say to get elected."

Weaver says Walling has also failed to address the city's crime and economic problems during his six years as mayor.

Weaver says she will do things differently if voters elect her next week.

For his part, Walling has repeatedly questioned Weaver's experience and her understanding of how government works.

Walling defends his record on crime, pointing to a decline in overall crime and more investment in downtown Flint and in other parts of the city.

Paul Rozycki is a professor emeritus at Mott Community College in Flint.

The long-time local political scientist says, despite the many issues facing Flint, water is the issue on voters' minds, and that's not good for Mayor Walling.

"He's taking heat for the water," says Rozycki. "Every time I go to a public forum, the first thing he gets beat up on is the water issue."

Earlier this month, Mayor Walling was the one to announce that Flint had reconnected to Detroit water. The switch took place less than two weeks after Walling stood next to Gov. Snyder to announce a $12 million dollar plan to disconnect the city's drinking water from the Flint River.

But challenger Karen Weaver hopes voters won't forget the 18 month experiment with the Flint River and that it happened during Mayor Walling's watch.

"I hope people don't say 'Oh well, he's done what he needs to do now…so everything's OK' because it's not," says Weaver. "Because this was a person who did not speak up for us. This was a person who was not honest with us."

Despite it all, Dayne Walling expects to win a third term as Flint mayor next week, though he predicts the election will be close.

"I'm in the fight. And I'm not going to stop fighting until it's won," says Walling. "I know there will be others that will come after me in later years. But, I want to continue leading this city as mayor."

Already hundreds of people have voted absentee, many of whom made up their minds about the mayor's race before the city switched back to Detroit water earlier this month.

---

http://www.mlive.com/lansing-news/index.ssf/2015/10/ananich_blasts_flint_water_fai.html

By Jonathan Oosting | joosting@mlive.com
on October 28, 2015 at 7:01 AM, updated October 28, 2015 at 7:58 AM

LANSING, MI — Michigan Senate Minority Leader Jim Ananich had harsh words on Tuesday for former Flint Emergency Manager Darnell Earley, who has denied any culpability for the city's switch to Flint River water.

"This kind of fantasy, this fairy tale stuff, is just irresponsible, and he needs to take accountability for his failings in the past before he expects us to trust him in the future," said Ananich, D-Flint.

The city began drawing drinking water from the Flint River in April of 2014, while Earley was in charge. Scientists later discovered dangerously high lead levels in drinking water and the blood of children.

Earley, now serving as a state-appointed emergency manager for Detroit Public Schools, was at the Capitol for a legislative hearing on that district's financial struggles and need for state assistance.

Speaking with reporters before the hearing, Earley said he had been tasked with implementing a Flint water plan that had been put in motion before Gov. Rick Snyder picked him to run the city in October of 2013, calling it a "local decision" to switch sources.

The Flint City Council had approved a long-term plan to move off of Detroit water and join the new Karegnondi Water Authority, which is still in the process of building its own Lake Huron pipeline. The council resolution did not indicate support or opposition for using the Flint River in the interim, but Earley said that was part of the plan that city leaders presented him when he arrived.

"It didn't fall to me to second guess that issue," Earley said. "There's always concerns when you're treating water — river water is more difficult to treat — but it wasn't my role to act as the person responsible for determining what that involved."

Former Flint EM Darnell Earley: Water switch was local decision Darnell Earley answers Flint water questions outside an education hearing at the Michigan Capitol on October 27, 2015.

Flint Mayor Dayne Walling and other city leaders have disputed that characterization, and Ananich said he thinks "there's absolutely no question" that Earley is downplaying his role.

"He is telling a fairly tale from start to finish," Ananich said. "He knows the emergency manager made the decision. The City Council voted on the KWA, but there was nothing about Flint Water in there. It was a decision that was made by the emergency manager."

Ananich said Earley's recent comments make it difficult to trust him as he asks the Legislature to "bail out" Detroit Public Schools.

Snyder is seeking $715 million in state funding over 10 years to help the struggling district climb out from under a mountain of debt, a plan that Earley vouched for Tuesday at the Capitol.

"You fail in Flint, you fail everywhere else, and now you're asking me to trust you in Detroit? He needs to take responsibility for his actions before he expects me to do anything for him anywhere else," said Ananich.

The Michigan Legislature, at the behest of the governor, this month approved $9.35 million in state assistance to help Flint move back to Detroit water until the KWA pipeline is online, a switch that has already occurred. The state funding will also cover the costs of additional residential water filters and lead testing.

While Snyder has appointed a task force to review the Flint water switch. Ananich is also calling for legislative hearings and has backed U.S. Rep. Dan Kildee's call for a federal probe. Earley's description of the switch "really shows why an aggressive comprehensive investigation needs to happen," he said.

FLINT (WJRT) - (10/27/15) - A group of people is heading to Lansing and will demand whole house filters for people living in Flint, their medical expenses paid for and they want a state of emergency declared.

The group blames the state and governor for the water issues in Flint.

We're told two busloads of people will arrive at the Capitol Wednesday at 9 a.m.

---

http://www.metrotimes.com/detroit/michigans-department-of-environmental-quality-admitted-incompetence-in-the-flint-lead-problem-an-independent-investigation-is-needed-to-dete/Content?oid=2378217

Toxic Tapdance *By Curt Guyette*

You know things are bad when the best defense you can conjure is incompetence.

But that's exactly what Dan Wyant, director of Michigan's Department of Environmental Quality, resorted to last week when he admitted that the state mishandled the Flint water crisis.

"It has recently become clear that our drinking water program staff made a mistake while working with the city of Flint," Wyant announced in a written statement. "Simply stated, staff employed a federal protocol they believed was appropriate, and it was not."

It is bad enough that the obtuse and antiseptic nature of that admission stands in stark contrast to the human tragedy it is supposed to address: the contamination of a city's drinking water with lead, a potent neurotoxin that can cause permanent damage, especially in children.

Even worse than the statement itself is the fact that Wyant's comment, limp as it is, would likely not have been made at all were it not for a batch of emails obtained by Virginia Tech University professor Marc Edwards.

Edwards has been at the forefront of bringing to light the catastrophe that began in April 2014, when Flint's state-appointed emergency manager ordered the city stop buying its water from Detroit and start using the Flint River as the municipality's source of drinking water.

When that changeover occurred, the state should have ensured Flint continued using chemicals designed to control corrosion — and keep lead from leeching into the water flowing into people's homes.

Instead, according to Flint Public Works director Howard Croft, officials at the MDEQ decided against using corrosion control.

Why?

According to Wyant, it is because MDEQ staff was confused, and somehow applied rules intended for cities much smaller than Flint, which has nearly 100,000 residents.

Admitting to incompetence, it appears, is preferable to confessing to outright dishonesty and cover-up.

The documents obtained by Edwards and posted on the website FlintWaterStudy.org, as well as emails obtained by the ACLU of Michigan in a separate Freedom of Information Act request, show MDEQ staff adamantly refused to apply the type of corrosion control the U.S. Environmental Protection Agency said was required and common sense would indicate was absolutely needed to protect the health of Flint's residents.

Instead of reacting quickly when the problem started to become apparent in February, MDEQ officials dragged their feet, initially provided misinformation to the EPA, and then tried to tamp down legitimate fears once the true nature of the threat began to be publicly exposed.

The first alarm

On Feb. 26, Jennifer Crooks, Michigan program officer for the EPA's Region 5, sent MDEQ staff an urgent message regarding high levels of lead in the water at the home of Flint resident LeeAnne Walters and her family, according to documents obtained by the ACLU of Michigan through a Freedom of Information Act request.

Crooks reported to MDEQ that Flint's utilities manager, Mike Glasgow, had tested Walters' home for lead.

"WOW!!!! Did he find LEAD!" Crooks exclaimed.

Lead levels of 104 parts per billion were detected — seven times the federal action level of 15 parts per billion.

"She has two children under the age of 3," Crooks wrote. "Big worries here."

The problem, Crooks explained, was that the river water, chemically so different than the much cleaner Lake Huron water previously supplied by Detroit, was "leaching out contaminants of the biofilms inside the pipes."

That biofilm — essentially a protective coating created by the addition of phosphates to the water — was being destroyed by the highly corrosive river water.

Water that contained no corrosion control.

But the EPA, at that point, didn't know that. Crooks assumed MDEQ was adhering to federal regulations and using some sort of corrosion control, but wasn't sure about the specifics.

"Flint must have Optimal Corrosion Control Treatment," Crooks wrote. "Is it phosphates?"

The next day, the MDEQ's Stephen Busch, district supervisor for the Flint region, replied with an email assuring the EPA that the city of Flint did indeed have an optimized corrosion control program. But he offered no specifics.

In reality, however, there was no such program in place at all.

In March, Crooks sent another email to MDEQ staff, saying the situation at Citizen name / Ex. 6 had grown worse, with a second test finding water lead levels of 397 parts per billion.

"Any thoughts on how to respond to her?" Crooks asked. "I'm running out of ideas."

At that point, the MDEQ tried to make it seem that the high lead levels being found in Walters' home came from lead plumbing rather than from a citywide infrastructure problem with the old pipes that run throughout much of Flint.

But a personal inspection by the EPA's Miguel Del Toral found what the Walters family knew: The lead had to be coming from outside, because the plumbing in their house was all made of plastic.

It was in April that the EPA finally learned that Flint, operating under the guidance of the MDEQ, in fact had no corrosion-control program.

Despite that, MDEQ director Wyant was insisting at a press conference in October that the city *did* have a corrosion treatment program in place all along — even though two different independent studies had already produced evidence of a severe lead problem in Flint's water.

Lime was being used to do the job, Wyant told a crowd of reporters gathered in a room at Flint's Kettering University. It just wasn't doing a good enough job, he asserted.

But according to Virginia Tech's Edwards, adding lime to Flint's water was actually exacerbating the corrosion problem.

"I was relaying what staff and consultants have indicated to me," Wyant said in a statement provided to *The Detroit News*. "Lime softening was used to address the hardness of the water. While this has an impact on pH, testing bore out that more needed to be done."

Indeed.

"At this point, nothing MDEQ says should be believed," wrote Edwards in a posting on FlintWaterStudy.org.

All along, it had been forces outside of the MDEQ that have been responsible for getting the truth out about the problems of lead in Flint's water.

Regarding corrosion control, it was Walters, the mother of a 4-year-old son found to have elevated levels of lead in his blood, who ferreted out the truth.

Determined to do everything within her power to make sure no other innocent children were damaged, she kept digging for the truth, and then looked for allies who would help expose it.

One of the things she did, after learning from Del Toral the state's claims about the use of corrosion control, was to contact officials in the city's Department of Public Works. That's when she learned that corrosion control had not been used since April 2014, when the switch to the Flint River was made.

As Edwards reported on FlintWaterStudy.org:

"First, Flint residents had to determine on their own that MDEQ's assertion of 'optimal corrosion control' was false, after children's blood lead was elevated from drinking the water. When confronted, MDEQ then acknowledged that Flint had 'no corrosion control.'"

So, is it really incompetence, as Wyant is now claiming, or intentional cover-up?

That question has yet to be answered with certainty, but here is one fact to consider: In February, the EPA told the MDEQ that it could provide Flint with a corrosion expert who could come in and assist in uncovering the source of the city's lead problem.

That offer was ignored until September, when a collaborative effort by members of Flint's Clean Water Coalition, Edwards and his team of researchers at Virginia Tech, and the ACLU of Michigan led to an independent, citywide study the revealed the truth: Lead levels were much higher than what the city and state were claiming.

Lost trust

At this point, Wyant and the MDEQ have zero credibility.

As the emails obtained by Edwards and the ACLU of Michigan clearly show, the department knew as early as February that Flint had a lead problem.

When a scathing internal EPA memo written by Del Toral was obtained by the ACLU and published in July, MDEQ spokesman Brad Wurfel's public response was to call Del Toral a "rogue" employee and to assure the people of Flint they could "relax" when it came to concerns about lead in their water.

Likewise, the department's initial reaction to both the independent Virginia Tech study and a subsequent study by Dr. Mona Hanna-Attisha at Hurley Children's Hospital — who found the number of children with elevated levels of lead in their blood doubled after the switch to the river — was to attempt to discredit results that didn't comport with state and city claims that the water was safe.

When the MDEQ and Gov. Rick Snyder were finally forced to acknowledge, on Oct. 8, that the disastrous decision to switch to the Flint River — a cost-saving measure taken by the emergency manager given complete control of Flint by Snyder — had to be reversed, the governor continued to act as if this were all just some kind of governmental glitch.

A town's water supply had been contaminated with lead. Children would suffer from lower IQs, learning disabilities and behavioral problems as a result, scarred for the rest of their lives.

Even so, Snyder tried to maintain that there was no reason to find out who is to "blame" for this and hold them accountable. Instead, he maintained, an "after-action report" to assure similar mistakes wouldn't be made in the future would suffice.

To date, the only repercussion meted out by the MDEQ has been to reassign one employee.

That, clearly, is inadequate. It is also just as clear that the MDEQ can't be trusted to investigate itself.

Snyder has since been forced to step up his response and last week appointed an "independent" task force to investigate the issue.

Is that enough? State Sen. Minority Leader Jim Ananich (D-Flint) doesn't think so. He is calling for a truly independent inquiry, meaning that Snyder wouldn't be the one choosing the investigators, with the power to put people under oath.

Ananich has also joined with U.S. Rep. Dan Kildee in asking for the federal government to step in and investigate as well. Along with look at what the roles played by the state and city in creating this disaster, the two legislators want to know what responsibility the U.S. EPA bears as well.

"It has become clear to me that unacceptable lead levels were a failure of government at every level," Kildee wrote last week in a letter to EPA administrator Gina McCarthy. "In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint."

Curt Guyette is an investigative reporter for the ACLU of Michigan. He can be reached at 313-578-6834 or cguyette@aclumich.org.

http://www.detroitnews.com/story/news/politics/2015/10/28/agency-criticized-flint-water-drops-marketing-plan/74729624/

Associated Press 8:44 a.m. EDT October 28, 2015

Lansing — The Michigan Department of Environmental Quality, which has faced criticism for its handling of Flint's problems with lead in drinking water, has shelved a proposal to spend up to $100,000 to develop its brand.

The Flint Journal reported that a request for proposals was issued Oct. 23. The newspaper sought details on Tuesday morning and was told by the department that it had pulled the bid and put the proposal on hold.

The request for proposals came several days after DEQ Director Dan Wyant acknowledged federal rules weren't followed properly in Flint when the city last year made the switch to the Flint River for its water supply. Flint has reconnected to Detroit's water system in hopes of resolving the health emergency.

Department spokesman Brad Wurfel said the marketing strategy was discussed for more than a year and isn't related to recent developments in Flint. He said the DEQ recognizes "that with the broader budget conversations underway, this is not the time to prioritize this project."

He said the request for proposals aligns with "the department's goal of continually improving its relationships with stakeholders and delivering the best customer service we can"

Flint, a city of about 99,000 people, switched from Detroit's water system while under state emergency financial management. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron that is scheduled to be completed next year. But residents complained about the taste, smell and appearance of water coming into their homes and businesses from the Flint River.

Officials long maintained that the water met safety standards. But corrosive water was drawing lead from aging pipes, and the state recently corroborated findings of elevated lead levels in children and disclosed higher lead amounts in three Flint schools. Republican Gov. Rick Snyder and the GOP-led Legislature earlier this month approved $9.3 million in aid to address the crisis.

The DEQ had posted a request for marketing strategy proposals online, seeking a contractor to develop a DEQ brand, a communication plan, branding techniques and training for state workers. The deadline was listed as Nov. 4 and the anticipated start date for the contract was Jan. 2.

http://www.mlive.com/opinion/flint/index.ssf/2015/10/editorial_darnell_earley_water.html

MLive/Flint Journal opinion
on October 27, 2015 at 3:30 PM, updated October 27, 2015 at 3:55 PM

The following is an opinion by The Flint Journal Editorial Board.

FLINT, MI -- Protests by ex-Flint emergency manager Darnell Earley that local leaders are to blame for the Flint River water switch should fall on deaf ears.

Earley says that the decision to use Flint River water as the city's drinking source was a local decision made months before his 2013 appointment to run the city.

That claim, however, ignores the fact that Flint has been under the control of state-appointed financial managers since 2011.

In making the case for not holding himself accountable, Earley points to a March 2013 vote by the Flint City Council that approved a plan by Flint Mayor Dayne Walling to go with the KWA pipeline from Lake Huron for city drinking water.

But the subject of that vote was not for a switch to the Flint River as primary source of drinking water. And, perhaps more importantly, that vote — like every other vote and plan from the mayor over the past four years under state stewardship — held no real power.

At the end of the day, it was Earley and the other three emergency managers selected by Gov. Rick Snyder who had ultimate say in how the city got its drinking water. A June 2013 resolution signed by Emergency Manager Ed Kurtz is the only documentation we've seen that points to who made the decision to switch to the Flint River.

To that end, we would ask that Kurtz step forward and explain exactly what went into the decision to use Flint River water and who signed off on it.

He and Snyder owe that much to the citizens who lost their democratic voice when the state declared its takeover of Flint.

It's nonsense to shift the blame onto powerless local people.

The state's emergency manager law makes it clear: "Upon appointment, an emergency manager shall act for and in the place and stead of the governing body and the office of chief administrative officer of the local government."

The wording of the law goes on to say that elected leaders shall not exercise their powers of office unless the emergency manager says so, and adds: "The emergency manager shall have broad powers in receivership... to assure the fiscal accountability of the local government and the local government's capacity to provide or cause to be provided necessary governmental services essential to the public health, safety, and welfare."

Sara Wurfel, a spokeswoman for Snyder, said in a statement last week that the decision to use the Flint River "was pushed or supported by the city and community."

It's nonsense to shift the blame onto powerless local people. The city council voted in March to end use of the Flint River, but it was purely symbolic. The state-appointed emergency manager was still at the helm of the city and the council had no authority.

To put the responsibility for the change on the back of a community forcibly taken over by the state is yet another insult from Lansing.

At a time when Flint parents are left to wonder how much lead damage has been done to their children, it's outrageous for anyone to shirk responsibility in the decisions that were made.

It's time for the blame game to end.

The state and its emergency managers are ultimately responsible for the decision and they must own it.

http://www.mlive.com/news/flint/index.ssf/2015/10/state_deq_seeks_marketing_stra.html

By Ron Fonger | rfonger1@mlive.com
FLINT, MI -- The state Department of Environmental Quality has shelved a proposal to spend up to $100,000 to develop its brand -- a marketing plan that was issued just a few days after the agency admitted it made mistakes in Flint's water crisis.

The Flint Journal-MLive requested information on the proposal on Tuesday morning, Oct. 27. Shortly after, a DEQ spokesman said the agency "pulled the bid this morning and put the proposal on hold."

"It'll remain a long-term consideration for us..." spokesman Brad Wurfel said.

The DEQ had posted a request for marketing strategy proposals online, seeking a contractor to develop a DEQ brand, a communication plan, branding techniques and training for state workers at a cost not to exceed $100,000.

"The goal of this project is to implement strategies that connect the vision and brand DEQ is trying to portray with the image that DEQ's stakeholders and staff perceive," reads the RFP.

The request for proposals was issued Oct. 23, four days after Dan Wyant, the DEQ's director, acknowledged his department had mistakenly followed the wrong federal regulations for 17 months in Flint as a lead-in-water health emergency developed.

Wyant has also told The Associated Press that the DEQ's response to criticism "was the wrong tone early in this conversation."

Wurfel said the development of a marketing strategy is something that's been discussed for more than a year at the department and is unrelated to recent developments with

Flint's water.

He said the request for proposals aligns with "the department's goal of continually improving its relationships with stakeholders and delivering the best customer service we can ..."

In pulling the proposal on Tuesday, the DEQ recognized "that with the broader budget conversations underway, this is not the time to prioritize this project," Wurfel said.

DEQ has increasingly been fielding questions about its role in protecting public health in Flint following the declaration of a public health emergency because of rising lead levels here.

Wyant has said DEQ employees should have required the city to treat Flint River water to make it less corrosive for the last 17 months but did not because they followed the wrong federal regulation.

Researchers have said the resulting corrosive water, combined with many lead service lines in the city, caused elevated lead levels in drinking water and in the blood of infants and young children since the city began using the river in April 2014.

Rising levels of lead in Flint water have attracted the attention of a national audience and fixing the problem is costing the state millions of dollars, including $6 million to reconnect Flint to Lake Huron water from the Detroit Water and Sewerage Department.

The deadline for DEQ marketing strategy proposals was listed as Nov. 4 and the anticipated start date for the contract was Jan. 2, 2016.

http://www.washingtontimes.com/news/2015/oct/28/congressman-holding-telephone-town-hall-about-flin/

By - Associated Press - Wednesday, October 28, 2015

FLINT, Mich. (AP) - Congressman Dan Kildee is holding a telephone town hall for Flint residents featuring experts who can discuss the city's water problems.

The Michigan Democrat's call-in event takes place Wednesday night. He says it will offer an update about ongoing efforts to improve water quality. Experts, including those who helped draw attention to Flint's water problems, are expected to take questions from residents.

Kildee, who represents the Flint area, and state Senate Minority Leader Jim Ananich of Flint said last week they asked U.S. Environmental Protection Agency to answer questions after elevated blood-lead levels were found in children whose Flint homes received river water.

Flint switched from Detroit's water system last year in a cost-cutting move. The city has reconnected in hopes of resolving the health emergency.

Subject: Is any of this advice we provided to Chicago residents about lead in drinking water relevant or helpful for Flint residents?

Hi Tom and Miguel, We are building a web page about the Flint drinking water situation and are trying to decide which information will be most helpful and relevant for Flint residents. This is some of the information we posted following the publication of the Chicago lead in drinking water study two years ago. Do you think any of it could be adapted for Flint residents? Do you think any of it would be helpful?

Advice to Chicago Residents

EPA and the Centers for Disease Control and Prevention believe there is no safe level of lead exposure. Lead is harmful to health, especially for children. While paint, dust, and soil are the most common sources of lead, drinking water can contribute 20 to 40 percent of an infant's lead exposure.

The goal is to remove as much lead from your drinking water as possible.

Chicagoans concerned about lead in their drinking water have a number of options to help reduce the amount of lead in their drinking water.

- **Have your water tested.** Many public water systems will test drinking water for residents upon request. Chicago residents can call 311 for information. You can also check the State of Illinois' drinking water website EXIT Disclaimer for a list of laboratories certified to analyze for lead.
- **Be aware of any work that could disturb your lead service line,** such as water main replacement, lead service line repair or replacement of part of the service line.
- **Run water before use if it has not been used for several hours**. The amount of time to run the water will depend on whether the home has a lead service line or not.
- **Use only cold water for drinking, cooking, and preparing baby formula.**
- **Purchase a water filter** that is certified to remove "total lead."
- On a regular basis **clean and remove any debris from faucet aerators** to clear out any particles of lead that may become trapped in the aerator.
- **Purchase lead-free faucets and plumbing components.**
- **Remove the entire lead service line.**

Flushing Instructions

Flushing *when the water has not been used for several hours*

Whether or not you have a lead service line, whenever the water has not been used in the household for several hours, you should run the water to flush the lead out. The more time water has been sitting in your home's pipes, the more lead it may contain. This is true even if you do not have a lead service line because plumbing fixtures like faucets and valves can contain small amounts of lead. However, the amount of time you should run the water to flush the lead out depends on whether you have a lead service line or not.

How long to run the water *if you do not have a lead service line*

Running the water for 30 to 45 seconds at the kitchen tap should clear the lead from your household plumbing to the kitchen tap. If you have old (corroded) galvanized iron pipe in your home, it may take up to 1 minute to fully flush the tap. Once you have done this, fill a container with water and store it in the refrigerator for drinking and cooking throughout the day.

How long to run the water *if you do have a lead service line*

Flushing times can vary based on the length of your lead service line and the plumbing configuration in your home. The length of lead service lines varies considerably. If your home is set back far from the street, a longer flushing time may be needed to lower lead levels, which may not be a practical solution.

The results of the lead sampling study conducted in Chicago in single-family homes with lead service lines showed that it could take 3 minutes of running the water to significantly reduce lead levels and it is not possible to clear all of the lead from the drinking water using flushing. There will always be some lead in the water. If you have old galvanized iron plumbing, lead can deposit in the corroded pipes and it can take up to 5 minutes of running of the water to significantly reduce lead levels.

In addition, flushing will vary with your household plumbing. Flushing one tap in the home in most cases does not clear lead from all of the household plumbing, because the water flows from the lead service line only to the faucets that are open, so running the water anywhere for 3-5 minutes will clear most of the lead from the lead service line, but depending on your household plumbing there may still be lead in the pipes and other taps in your home. You may need to flush the tap you are going to use water from for another 30-45 seconds to clear any remaining lead.

If you have a lead service line and you flush the tap you are going to use, such as the kitchen tap, for 3-5 minutes (or longer if instructed to do so by your water provider) this will clear most of the lead from the water.

To conserve water, instead of flushing the tap to be used for 3-5 minutes, take a shower or do a load of laundry. Either activity would clear most of the lead from the lead service line. However, taking a shower or doing a load of laundry will not flush the lead out of the entire the interior plumbing. Flushing the kitchen or bathroom tap for additional 30-45 seconds after showering or doing a load of laundry will clear the rest of the plumbing to the kitchen or bathroom tap.

Another alternative to conserve water is watering the garden for 3 minutes using the outside tap, which will clear the high lead from within the lead service line. This will not clear any of the lead from the internal plumbing, so right after watering the garden, flush the kitchen or bathroom tap for an additional 30-45 seconds.

After you have flushed your plumbing, filling up a container of water and storing it in the refrigerator for drinking and cooking throughout the day will reduce your lead exposure.

When is *flushing not recommended*

- If your lead service line is very long, flushing may not effectively lower lead levels.
- If your home has old (corroded) galvanized iron pipes, flushing may not be practical.

If the water flows slowly in your home and you have galvanized iron pipes, these pipes may be severely corroded inside. If you have a lead service line, the water may need to run for at least 5 minutes to significantly reduce lead levels, which may not be a practical solution for you, and you may wish to consider using a water filter that is certified to remove 'total lead'. Total lead includes lead that is dissolved in the water as well as lead particles that come loose from the plumbing.

Instructions for flushing out the particles and sediment *following a disturbance* to your lead service line.

If you have a lead service line and your lead service is disturbed, lead in your drinking water can increase to dangerous levels and particles containing high levels of lead can become trapped in your home plumbing.

Avoid bringing the lead-containing particles and sediment into your home or to the tap you drink from by following these instructions whenever your lead service is disturbed.

Find the closest available tap to where the water comes into the home that is not used for drinking water (such as an outside hose bib, laundry sink or bathtub) to flush the lead-containing particles out of the plumbing. Fully open the cold water tap and let the water run for at least five minutes to flush the lead-containing particles out of the plumbing so that the particles and sediment do not enter the rest of your household plumbing. The key is to pick the closest faucet not used for drinking that would result in the least amount of particles and sediment coming into the home plumbing.

Collecting Samples

If you are having your water tested for lead, it's important that you collect water samples in a specific way to ensure accurate results. The sampling recommendations and instructions depend on whether you have a lead service line or not. Testing the water for homes with lead service lines is more complex than for homes without a lead service line, so there are different sampling instructions for each situation.

City of Flint
Technical Advisory Committee - Weekly Report

October 28th, 2015

Last meeting: 10-7-2015
Next meeting: 11-18-2015, 2:00 pm

I. Overview –

Please note that we have set the date for the next meeting at **Wednesday November 18th** 2:00 pm at Flint City Hall (there will be a call in number). The previous date proposed is Veterans Day and there were several conflicts.

II. New Items this week

Technical Advisory Committee Addition

I have added Professor Shawn McElmurry, An Associate Professor at Wayne State University in the Dept. of Civil and Environmental Engineering to the TAC team. Professor McElmurry contacted me a few weeks ago and visited the Water Plant and took several samples from the Flint River and the distribution system.

Professor McElmurry's team has submitted a proposal to the National Institute of Environmental Health Sciences (NIEHS) for funding to evaluate how changes in the drinking water system are impacting water quality. Their project has the following goals:

- Define exposure within Flint's drinking water system using a combined sampling and modeling approach.
- Quantify how the concentrations of DBPs and Pb change over time within the water distribution system.
- Apply a high-throughput bioassay to evaluate toxicity of complex chemical mixtures (focused on DBPs).
- Communicate results to water utility operators, government officials (city, state, and federal), public health agencies and residents using principles of risk communication through a variety of channels including social media.

Given their goals and their proximity to Flint, I believe that adding Professor McElmurry to the Technical Advisory Team will bring added evaluation and data to our cause.

III. Ongoing Items of concern or in process

A. Detroit Water

Water from Detroit is now flowing through all of the transition mains and should be present at most taps throughout the City. We are flushing hydrants in a manner to help circulate water within the system, individual usage patterns will dictate water being at every household and business. We will be testing hardness and phosphate levels over the next several days across the city to verify the presence of Detroit water.

B. Service Lines

I want to clarify where we are regarding the service line data. The 45,000+ cards are only one aspect of the information and represent the original data. As work has occurred over the last several decades, the Service Center has built a second, partial set of cards with updated information. Both sets of cards are kept as permanent records with accurate data. We also have maps which were last updated in 1984 with additional information. Finishing what the City started has involved stitching together three sets of data and then putting that into a database.

U of M Flint has taken ownership of the project and they have measured how much labor it will take to complete the task. Professor Kaufman is working pro bono but has just submitted a proposal to the City for the labor required in order to complete the task. The proposal will be turned around ASAP for them to complete the work.

C. Corrosion Control

On October 19th 2015 our engineering consultant submitted a design package to the DEQ with recommended phosphate dosing. After EPA review, the comments were just returned and today LAN is discussing with DEQ when to expect final approval and permitting. There are questions regarding the elevated dose of phosphate that we will bring to the next Technical Advisory meeting for discussion. The questions will are largely around the pros and cons of the specified dose level and the public communication and expectations that should accompany the implementation.

Issue	Description	Action Item	Owner
Corrosion Control	To help recoat the piping	The final design has been sent to MDEQ for peritting.	LAN
Surge Protection	Main breaks are down.	Leak detection will continue for the next few months.	City Staff
KWA - Prep	Design and installation of final improvements needed	Internal November 5th meeting scheduled to discuss specifics. See item IV.	LAN/City
KWA - Transfer Station	Buffer for water supply from KWA	Internal November 5th meeting scheduled to discuss specifics. See item IV.	LAN
Hydraulic Model	Filling with data	Need to verify broken valve locations for model to be accurate.	LAN/City
SCADA Upgrades	Used to develop automation within the system.	First phase went in in FY15 second and final phase due to be installed prioir to KWA's arrival.	City Staff

IV. Needs for treating and using water from KWA

The City is meeting with the engineering consultants on Thursday November 5th in order to build a project timeline of all items needed to be prepared for water delivery from KWA. The following items will be discussed:

A. Design and construction of transfer station to Dort Reservoir (while in use).
  - Needed to buffer the volume of water that KWA is capable of delivering prior to their reservoir tank being activated.

B. KWA access to the plant.
  - The current design calls for use of the pipe that was empty and is now in use. An alternate plan needs to be discussed and vetted.

C. Alum feed system
  - Needed for coagulant change to raw water and to reduce chloride.

V. Testing Data

We will continue to update this data table weekly, if there is something that is missing or additional data that is requested please let me know and we will attempt to add it to the table.

Date	Flow (MGD)	pH (S.U.)	Total Hardness (mg/L)	Total Alkalinity (mg/L)	Non-carbonate Hardness (mg/L)	Chloride (mg/L)	Calcium (mg/L)	Magnesium (mg/L)	Total Phosphate (mg/L)
Range GLWA	12 - 19	7.3 - 7.6	98 - 102	70 - 76	26 - 32	11 - 13	26 - 32	3.9 - 6.3	1.0 - 1.2
10/26/2015	12	7.36	102	74	28	11	30.5	6.3	1.14

Subject: RE: TAC Team Update 10_28_15

Tim,

In addition to WQTC being that week, it is also the same week as the National Drinking Water Advisory Council meeting, which is why I won't be at WQTC this year. The NDWAC will be deliberating Tuesday afternoon and all day Wednesday on the NDWAC Working Group report so that they can provide final recommendations to EPA on revisions to the Lead and Copper Rule.

Tim;

Thanks for clearly representing our concerns about the certified labs today. I am still concerned that the requirement will inhibit other studies that need to be done—the pilot testing and assessment kinds of investigations that are engineering/corrosion control "best practices," not LCR requirements. Plus, testing diagnostic testing protocols to determine best what does and doesn't work, such as techniques for sampling to detect LSLs, and sampling programs for buildings that better locate contamination or reflect more on resident exposure. It still sounded to me that they wanted direct control over all Pb results, regardless of the study origin. Maybe we in EPA should talk about this some more?

The other thing which really annoys me is AGAIN scheduling the Technical Advisory committee meeting with zero consultation with the technical "experts." I had to miss the last one, and Darren, myself, and Marc Edwards, all are going to be at WQTC. Jeff usually goes. That conference is the most important technical drinking water conference of the year, and the dates are well known. I might even add, shouldn't some of the others be going there, too, given the many treatment and sampling issues that have become so clear in the last few months?

Subject: TAC Team Update 10_28_15

Team,

The next Technical Advisory Meeting is set for **Wednesday November 18th 2:00 pm** at Flint City Hall. The previous date being considered was Veterans Day and we encountered several conflicts. There will be a call in number available and I will send an agenda prior to the meeting.

There is a significant amount of new information included in this weekly report and I expect that trend to continue as we move forward. Several of the items mentioned such as the specific dosing level of phosphate will become targets of discussion at this next meeting in order to thoroughly evaluate the pros and cons and to help with public information.

The testing map continues to have information added as it becomes available and on the weekly report we have inserted a data table that will be updated regularly as well. Please let me know if anyone is interested in additional data being reported.

Please be prepared to give input on the potential of a December meeting which would have to be December 9th or December 16th.

Thank you,

--

How about the following as a statement regarding CCT at Flint?

As of the October 16 switch back to Detroit (Great Lakes Water Authority) water, Flint began once again to get drinking water treated with orthophosphate for lead corrosion control. Michigan expects to issue a permit to Flint for construction for additional treatment in the near future, and will provide instruction, developed in consultation with the EPA Task Force, on additional phosphate dosage and monitoring.

Subject: Is any of this advice we provided to Chicago residents about lead in drinking water relevant or helpful for Flint residents?

Hi Tom and Miguel, We are building a web page about the Flint drinking water situation and are trying to decide which information will be most helpful and relevant for Flint residents. This is some of the information we posted following the publication of the Chicago lead in drinking water study two years ago. Do you think any of it could be adapted for Flint residents? Do you think any of it would be helpful?

Advice to Chicago Residents

EPA and the Centers for Disease Control and Prevention believe there is no safe level of lead exposure. Lead is harmful to health, especially for children. While paint, dust, and soil are the most common sources of lead, drinking water can contribute 20 to 40 percent of an infant's lead exposure.

The goal is to remove as much lead from your drinking water as possible.

Chicagoans concerned about lead in their drinking water have a number of options to help reduce the amount of lead in their drinking water.

- **Have your water tested.** Many public water systems will test drinking water for residents upon request. Chicago residents can call 311 for information. You can also check the State of Illinois' drinking water website EXIT Disclaimer for a list of laboratories certified to analyze for lead.
- **Be aware of any work that could disturb your lead service line and flush your water per the flushing direction below,** such as water main replacement, lead service line repair or replacement of part of the service line.
- **Run water before use if it has not been used for several hours**. The amount of time to run the water will depend on whether the home has a lead service line or not.
- **Use only cold water for drinking, cooking, and preparing baby formula.**
- **Purchase a water filter** that is certified to remove "total lead."
- On a regular basis **clean and remove any debris from faucet aerators** to clear out any particles of lead that may become trapped in the aerator.
- **Purchase lead-free faucets and plumbing components.**
- **Remove the entire lead service line.**

Flushing Instructions

Flushing *when the water has not been used for several hours*

Whether or not you have a lead service line, whenever the water has not been used in the household for several hours, you should run the water to flush the lead out. The more time water has been sitting in your home's pipes, the more lead it may contain. This is true even if you do not have a lead service line because plumbing fixtures like faucets and valves can contain small amounts of lead. However, the amount of time you should run the water to flush the lead out depends on whether you have a lead service line or not.

How long to run the water *if you do not have a lead service line*

Running the water for 30 to 45 seconds at the kitchen tap should clear the lead from your household plumbing to the kitchen tap. If you have old (corroded) galvanized iron pipe in your home, it may take up to 1 minute to fully flush the tap. Once you have done this, fill a container with water and store it in the refrigerator for drinking and cooking throughout the day.

How long to run the water *if you do have a lead service line*

Flushing times can vary based on the length of your lead service line and the plumbing configuration in your home. The length of lead service lines varies considerably. If your home is set back far from the street, a longer flushing time may be needed to lower lead levels, which may not be a practical solution.

~~The results of the lead sampling study conducted in Chicago in~~ single-family homes with lead service lines showed that it could take ~~3~~ 5 minutes of running the water to significantly reduce lead levels and it is not possible to clear all of the lead from the drinking water using flushing. There will always be some lead in the water. If you have old galvanized iron plumbing, lead can deposit in the corroded pipes and it can take up to 5 minutes of running of the water to significantly reduce lead levels.

In addition, flushing will vary with your household plumbing. Flushing one tap in the home in most cases does not clear lead from all of the household plumbing, because the water flows from the lead service line only to the faucets that are open, so running the water anywhere for 3-5 minutes will clear most of the lead from the lead service line, but depending on your household plumbing there may still be lead in the pipes and other taps in your home. You may need to flush the tap you are going to use water from for another 30-45 seconds to clear any remaining lead.

If you have a lead service line and you flush the tap you are going to use, such as the kitchen tap, for ~~3-~~5 minutes (or longer if instructed to do so by your water provider) this will clear most of the lead from the water.

To conserve water, instead of flushing the tap to be used for 3-5 minutes, take a shower or do a load of laundry. Either activity would clear most of the lead from the lead service line. However, taking a shower or doing a load of laundry will not flush the lead out of the entire the interior plumbing. Flushing the kitchen or bathroom tap for additional 30-45 seconds after showering or doing a load of laundry will clear the rest of the plumbing to the kitchen or bathroom tap.

Another alternative to conserve water is watering the garden for 3 minutes using the outside tap, which will clear the high lead from within the lead service line. This will not clear any of the lead from the internal plumbing, so right after watering the garden, flush the kitchen or bathroom tap for an additional 30-45 seconds.

After you have flushed your plumbing, filling up a container of water and storing it in the refrigerator for drinking and cooking throughout the day will reduce your lead exposure.

When is *flushing not recommended*

- If your lead service line is very long, flushing may not effectively lower lead levels.
- If your home has old (corroded) galvanized iron pipes, flushing may not be practical.

If the water flows slowly in your home and you have galvanized iron pipes, these pipes may be severely corroded inside. If you have a lead service line, the water may need to run for at least 5 minutes to significantly reduce lead levels, which may not be a practical solution for you, and you may wish to consider using a water filter that is certified to remove 'total lead'. Total lead includes lead that is dissolved in the water as well as lead particles that come loose from the plumbing.

Instructions for flushing out the particles and sediment *following a disturbance* to your lead service line.

If you have a lead service line and your lead service is disturbed, lead in your drinking water can increase to dangerous levels and particles containing high levels of lead can become trapped in your home plumbing.

Avoid bringing the lead-containing particles and sediment into your home or to the tap you drink from by following these instructions whenever your lead service is disturbed.

Find the closest available tap to where the water comes into the home that is not used for drinking water (such as an outside hose bib, laundry sink or bathtub) to flush the lead-containing particles out of the plumbing. Fully open the cold water tap and let the water run for at least five minutes to flush the lead-containing particles out of the plumbing so that the particles and sediment do not enter the rest of your household plumbing. The key is to pick the closest faucet not used for drinking that would result in the least amount of particles and sediment coming into the home plumbing.

Collecting Samples

If you are having your water tested for lead, it's important that you collect water samples in a specific way to ensure accurate results. The sampling recommendations and instructions depend on whether you have a lead service line or not. Testing the water for homes with lead service lines is more complex than for homes without a lead service line, so there are different sampling instructions for each situation.

How about this, Tim?

Flint recently switched back to receiving its water from the Great Lakes Water Authority (Detroit) -- as it had been doing prior to the shift to the Flint River. The Detroit water is treated with orthophosphate for lead corrosion control. MDEQ, in consultation with the EPA Task Force, is currently working on a plan for supplemental treatment to optimize the corrosion control dosage and monitoring for Flint.

How about the following as a statement regarding CCT at Flint?

As of the October 16 switch back to Detroit (Great Lakes Water Authority) water, Flint began once again to get drinking water treated with orthophosphate for lead corrosion control. Michigan expects to issue a permit to Flint for construction for additional treatment in the near future, and will provide instruction, developed in consultation with the EPA Task Force, on additional phosphate dosage and monitoring.

Bob – I was going to send the following to the task force members, but thought I had better check with you before I strayed too far out of my lane.

+++++++++

Hi all –

Just a quick note regarding the meeting in Flint. We are looking at hotel accommodations for the evening of the 9th and will let you know what looks to be available. We would like to be able to have a short face-to-face meeting before the official meeting on the 10th and it may be that the only available time would be the evening of the 9th at the hotel or maybe over dinner…we will see if that works out.

Also, it would be helpful to get your thoughts about what we want to make sure we cover or see or do while we are in Flint beyond the 10:00 meeting. For example, do we want to get to the treatment plant to see its condition and where they will be installing equipment for orthophosphate addition? Please let us know and we will see what we can arrange.

Subject: RE: TAC Team Update 10_28_15

Task Force Members –

Thanks for a very good call today with MDEQ. Ideally, we would have had a pre-call to discuss and present our concerns. Thanks for your flexibility in handling our concerns about laboratory certification at the outset of the call.

Also, since we are not in the same room, it's sometimes hard to know when and if we have heard all voices. Please know that I never mean to cut short any discussion – if you feel we need to continue on a subject, or if we have not fully considered something, I encourage you to speak up. Please feel free, and know that my attempts to find agreement and move to the next subject should never be construed as an attempt to limit full and robust discussion.

We should all plan to be in Flint on the morning of Nov. 10. Please start making your travel arrangements now. Details to follow.

Thanks,

Bob

Tim,

In addition to WQTC being that week, it is also the same week as the National Drinking Water Advisory Council meeting, which is why I won't be at WQTC this year. The NDWAC will be deliberating Tuesday afternoon and all day Wednesday on the NDWAC Working Group report so that they can provide final recommendations to EPA on revisions to the Lead and Copper Rule.

Tim;

Thanks for clearly representing our concerns about the certified labs today. I am still concerned that the requirement will inhibit other studies that need to be done—the pilot testing and assessment kinds of investigations that are engineering/corrosion control "best practices," not LCR requirements. Plus, testing diagnostic testing protocols to determine best what does and doesn't work, such as techniques for sampling to detect LSLs, and sampling programs for buildings that better locate contamination or reflect more on resident exposure. It still sounded to me that they wanted direct control over all Pb results, regardless of the study origin. Maybe we in EPA should talk about this some more?

The other thing which really annoys me is AGAIN scheduling the Technical Advisory committee meeting with zero consultation with the technical "experts." I had to miss the last one, and Darren, myself, and Marc Edwards, all are going to be at WQTC. Jeff usually goes. That conference is the most important technical drinking water conference of the year, and the dates are well known. I might even add, shouldn't some of the others be going there, too, given the many treatment and sampling issues that have become so clear in the last few months?

Subject: TAC Team Update 10_28_15

Team,

The next Technical Advisory Meeting is set for **Wednesday November 18th 2:00 pm** at Flint City Hall. The previous date being considered was Veterans Day and we encountered several conflicts. There will be a call in number available and I will send an agenda prior to the meeting.

There is a significant amount of new information included in this weekly report and I expect that trend to continue as we move forward. Several of the items mentioned such as the specific dosing level of phosphate will become targets of discussion at this next meeting in order to thoroughly evaluate the pros and cons and to help with public information.

The testing map continues to have information added as it becomes available and on the weekly report we have inserted a data table that will be updated regularly as well. Please let me know if anyone is interested in additional data being reported.

Please be prepared to give input on the potential of a December meeting which would have to be December 9th or December 16th.

Thank you,

--

Tim,

In addition to WQTC being that week, it is also the same week as the National Drinking Water Advisory Council meeting, which is why I won't be at WQTC this year. The NDWAC will be deliberating Tuesday afternoon and all day Wednesday on the NDWAC Working Group report so that they can provide final recommendations to EPA on revisions to the Lead and Copper Rule.

Jeff

Tim;

Thanks for clearly representing our concerns about the certified labs today. I am still concerned that the requirement will inhibit other studies that need to be done—the pilot testing and assessment kinds of investigations that are engineering/corrosion control "best practices," not LCR requirements. Plus, testing diagnostic testing protocols to determine best what does and doesn't work, such as techniques for sampling to detect LSLs, and sampling programs for buildings that better locate contamination or reflect more on resident exposure. It still sounded to me that they wanted direct control over all Pb results, regardless of the study origin. Maybe we in EPA should talk about this some more?

The other thing which really annoys me is AGAIN scheduling the Technical Advisory committee meeting with zero consultation with the technical "experts." I had to miss the last one, and Darren, myself, and Marc Edwards, all are going to be at WQTC. Jeff usually goes. That conference is the most important technical drinking water conference of the year, and the dates are well known. I might even add, shouldn't some of the others be going there, too, given the many treatment and sampling issues that have become so clear in the last few months?

Team,

The next Technical Advisory Meeting is set for **Wednesday November 18th 2:00 pm** at Flint City Hall. The previous date being considered was Veterans Day and we encountered several conflicts. There will be a call in number available and I will send an agenda prior to the meeting.

There is a significant amount of new information included in this weekly report and I expect that trend to continue as we move forward. Several of the items mentioned such as the specific dosing level of phosphate will become targets of discussion at this next meeting in order to thoroughly evaluate the pros and cons and to help with public information.

The testing map continues to have information added as it becomes available and on the weekly report we have inserted a data table that will be updated regularly as well. Please let me know if anyone is interested in additional data being reported.

Please be prepared to give input on the potential of a December meeting which would have to be December 9th or December 16th.

Thank you,

--

Hi all –

Just a quick note regarding the meeting in Flint. We are looking at hotel accommodations for the evening of the 9th and will let you know what looks to be available. We would like to be able to have a short face-to-face meeting before the official meeting on the 10th and it may be that the only available time would be the evening of the 9th at the hotel or maybe over dinner…we will see if that works out.

Also, it would be helpful to get your thoughts about what we want to make sure we cover or see or do while we are in Flint beyond the 10:00 meeting. For example, do we want to get to the treatment plant to see its condition and where they will be installing equipment for orthophosphate addition? Please let us know and we will see what we can arrange.

Task Force Members –

Thanks for a very good call today with MDEQ. Ideally, we would have had a pre-call to discuss and present our concerns. Thanks for your flexibility in handling our concerns about laboratory certification at the outset of the call.

Also, since we are not in the same room, it's sometimes hard to know when and if we have heard all voices. Please know that I never mean to cut short any discussion – if you feel we need to continue on a subject, or if we have not fully considered something, I encourage you to speak up. Please feel free, and know that my attempts to find agreement and move to the next subject should never be construed as an attempt to limit full and robust discussion.

We should all plan to be in Flint on the morning of Nov. 10. Please start making your travel arrangements now. Details to follow.

Thanks,

Bob

Hi Anne,

Sorry for not responding. There's a lot going on and nowhere near enough time to do it. We are doing the best we can and trying to focus on the most important things we can do to help the citizens in Flint. Tom and I are on the EPA task force, working with DEQ on the school sampling as well as ORD/DEQ on the OCCT framework. This takes a lot of time and discussion. We are also coordinating with ORC on the Flint timeline and responsive documents to information requests.

I think the most important thing right now for the website would be to provide information for residents in Flint on what we have found and how they can take interim measures to protect their families. That is very important and I will take a look at that first thing tomorrow morning, but I am respectfully requesting that we put off the videos for now so that we have adequate time to plan, discuss and work on matters that are directly related to fixing the problems in Flint.

Respectfully,

Hi all, as I think most of you know, my office is mocking up a webpage on Flint drinking water issues. This needs to be ready for review by tomorrow --COB Thursday, Oct. 29. I know all the WD folks are busy but we still need you to provide us with the final report (currently undergoing ORC review) and jpegs for the pictures from that final report, help with infographics and interviewees for the 1 minute “in the moment videos”.

Thanks very much. We’ll try to take up as little of your time as possible.

Bob: I know the Task Force and the Technical Advisory Committee are different entities, but given the overlap of people trying to help Flint out on technical issues, would it be appropriate to mention the issue with scheduling of the TAC meetings without regard to availability to the Flint POC? They are flexible enough to reschedule the original meeting on Nov 11th. Maybe they can pick another day when the experts are actually available.

Mike and I are on Flint's technical committee. The date they have suggested for that meeting falls the same week as WQTC. Mike and I (and likely Marc Edwards) will be there. I will suggest that the Flint committee consider meeting the Monday before the task force meeting. That would work great for Mike and I. All I can do is try. Darren

Subject: TAC Team Update 10_28_15

Team,

The next Technical Advisory Meeting is set for **Wednesday November 18th 2:00 pm** at Flint City Hall. The previous date being considered was Veterans Day and we encountered several conflicts. There will be a call in number available and I will send an agenda prior to the meeting.

There is a significant amount of new information included in this weekly report and I expect that trend to continue as we move forward. Several of the items mentioned such as the specific dosing level of phosphate will become targets of discussion at this next meeting in order to thoroughly evaluate the pros and cons and to help with public information.

The testing map continues to have information added as it becomes available and on the weekly report we have inserted a data table that will be updated regularly as well. Please let me know if anyone is interested in additional data being reported.

Please be prepared to give input on the potential of a December meeting which would have to be December 9th or December 16th.

Thank you,

Mike and I are on Flint's technical committee. The date they have suggested for that meeting falls the same week as WQTC. Mike and I (and likely Marc Edwards) will be there. I will suggest that the Flint committee consider meeting the Monday before the task force meeting. That would work great for Mike and I. All I can do is try. Darren

Tim;

Thanks for clearly representing our concerns about the certified labs today. I am still concerned that the requirement will inhibit other studies that need to be done—the pilot testing and assessment kinds of investigations that are engineering/corrosion control "best practices," not LCR requirements. Plus, testing diagnostic testing protocols to determine best what does and doesn't work, such as techniques for sampling to detect LSLs, and sampling programs for buildings that better locate contamination or reflect more on resident exposure. It still sounded to me that they wanted direct control over all Pb results, regardless of the study origin. Maybe we in EPA should talk about this some more?

Jordan & Amy:

To follow up on your question from today's call, here's what I've learned:

Flint recently switched back to receiving its water from the Great Lakes Water Authority (Detroit) -- as it had been doing prior to the shift to the Flint River. The Detroit water is treated with orthophosphate for lead corrosion control. MDEQ, in consultation with the EPA Task Force, is currently working on a plan for supplemental treatment to optimize the corrosion control dosage and monitoring for Flint.

Please let us know if you have additional questions.

Thanks,

Denise

Thanks, and I DO understand there's quite a bit to do. I'm fairly sure we can accomplish this pretty quickly tomorrow. We just did a trial run with Tinka today and it was fairly easy.

We'd like to have 3 slots

- Tim or Bob explaining the purpose of the task force
- Tom P explaining corrosion control
- Miguel discussing his work with a Flint resident to determine lead source

None of these slots will be more than 60 seconds. Phillippa and Pete help you walk you through the process tomorrow. It should take less than a half hour from start to finish.

So think about what points you want to make and we'll revisit tomorrow.

Thanks, again. We know there are many demands on your time.

Hi Anne,

Sorry for not responding. There's a lot going on and nowhere near enough time to do it. We are doing the best we can and trying to focus on the most important things we can do to help the citizens in Flint. Tom and I are on the EPA task force, working with DEQ on the school sampling as well as ORD/DEQ on the OCCT framework. This takes a lot of time and discussion. We are also coordinating with ORC on the Flint timeline and responsive documents to information requests.

I think the most important thing right now for the website would be to provide information for residents in Flint on what we have found and how they can take interim measures to protect their families. That is very important and I will take a look at that first thing tomorrow morning, but I am respectfully requesting that we put off the videos for now so that we have adequate time to plan, discuss and work on matters that are directly related to fixing the problems in Flint.

Respectfully,

Hi all, as I think most of you know, my office is mocking up a webpage on Flint drinking water issues. This needs to be ready for review by tomorrow --COB Thursday, Oct. 29. I know all the WD folks are busy but we still need you to provide us with the final report (currently undergoing ORC review) and jpegs for the pictures from that final report, help with infographics and interviewees for the 1 minute "in the moment videos".

Thanks very much. We'll try to take up as little of your time as possible.

The videos are solely to enhance the web content and user experience on the website we will be standing up. This website will be a key gateway to information for flint residents about what to do, what EPA is doing and what information they need to protect their health. I completely understand your concerns. Tinka's video test yesterday took about 10 to 15 min just given practice and each take. So it can be as short of a time grab as that. Let me know if you have time. If not I understand.

Hi all –

Just a quick note regarding the meeting in Flint. We are looking at hotel accommodations for the evening of the 9th and will let you know what looks to be available. We would like to be able to have a short face-to-face meeting before the official meeting on the 10th and it may be that the only available time would be the evening of the 9th at the hotel or maybe over dinner…we will see if that works out.

Also, it would be helpful to get your thoughts about what we want to make sure we cover or see or do while we are in Flint beyond the 10:00 meeting. For example, do we want to get to the treatment plant to see its condition and where they will be installing equipment for orthophosphate addition? Please let us know and we will see what we can arrange.

Task Force Members –

Thanks for a very good call today with MDEQ. Ideally, we would have had a pre-call to discuss and present our concerns. Thanks for your flexibility in handling our concerns about laboratory certification at the outset of the call.

Also, since we are not in the same room, it's sometimes hard to know when and if we have heard all voices. Please know that I never mean to cut short any discussion – if you feel we need to continue on a subject, or if we have not fully considered something, I encourage you to speak up. Please feel free, and know that my attempts to find agreement and move to the next subject should never be construed as an attempt to limit full and robust discussion.

We should all plan to be in Flint on the morning of Nov. 10. Please start making your travel arrangements now. Details to follow.

Thanks,

Bob

Subject: TAC Team Update 10_28_15

Team,

The next Technical Advisory Meeting is set for **Wednesday November 18th 2:00 pm** at Flint City Hall. The previous date being considered was Veterans Day and we encountered several conflicts. There will be a call in number available and I will send an agenda prior to the meeting.

There is a significant amount of new information included in this weekly report and I expect that trend to continue as we move forward. Several of the items mentioned such as the specific dosing level of phosphate will become targets of discussion at this next meeting in order to thoroughly evaluate the pros and cons and to help with public information.

The testing map continues to have information added as it becomes available and on the weekly report we have inserted a data table that will be updated regularly as well. Please let me know if anyone is interested in additional data being reported.

Please be prepared to give input on the potential of a December meeting which would have to be December 9th or December 16th.

Thank you,

--

Howard Croft

Jim –

On behalf of the Task Force, thank you for the opportunity to discuss and comment on the corrosion control plan for Flint. We are encouraged to hear that yesterday Michigan issued the permit to Flint for installation of the equipment needed for phosphate addition for corrosion control treatment. The Task Force believes that the instructions in the plan regarding the form of phosphate, dosage, and equipment sizing are clear and that Flint needs to begin to implement the additional corrosion control treatment as soon as possible.

Bob –

I knew it would be difficult to convene a call of all of the TF members this afternoon, so I sought their feedback on a draft message to the state by means of email. I got responses back from Jeff, Tom and Darren. I called and spoke with Mike. All responded favorably. I did not hear back from Miguel, but I understand that he is off for the day. Tom informed me that his earlier discussion with Miguel confirmed that he supported sending such a message and that he did not believe that Miguel would have any issue with how the message was written. Based on this feedback, I believe that the message below represents the position of the TF and encourage you to send it to Jim.

Subject: RE: Flint Task Force -- MDEQ PO4 permit

Tim,

I agree with Mike that there appears to be an issue with the orthophosphate being reported as P or as PO4. The language we were discussing stated:

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well.

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

The language on the PO4 permit is a bit different in a couple of areas:

It states that a dosage of 0.8 mg/L as PO4 has been recommended for the Detroit water. This seems inconsistent with the above DWSD's OCCT requirement for a minimum of 0.9 mg/L and the current dose of 1.2 mg/L as PO4.

In the first paragraph of the permit, the units are expressed as mg/L as PO4. In the third paragraph, the permit states that the arriving water from Detroit will have some residual PO4 and it has been reported that this residual will be approximately 0.4 mg/L The permit does not specify the units here. Based on the information that we were discussing (and excerpted above), it appears that it is approximately 0.4 mg/L as P or 1.2 mg/L as PO4. Thus, it appears that the permit is not using consistent units between the first and third paragraphs. I think the permit needs to either use consistent reporting units or even better spell out as P or as PO4 in every instance to avoid problems.

Hope that helps.

Jeff

Subject: RE: Flint Task Force -- MDEQ PO4 permit
Importance: High

Tim;

There is a unit "issue" in the section of phosphate dosages. In our phone call the other day, DEQ indicate the units discussed were mg/L as P, when we questioned how much phosphate was being consumed in the Flint system from the Detroit water feed This also came up in a prior discussion on the phone Darren and I had with DEQ about observations of phosphate loss, even within Detroit. The recommendations Darren and I provided for an initial dose of a total amount of PO4 (as PO4), were that the target residual to the estimated theoretical point of diminishing returns to optimize phosphate (in lieu of having it be determined by actual pilot testing) should be in the 3-4 mg/L as PO4 neighborhood, closer to 4.

At this time (but not when they change water supplies!) they only need to supplement the PO4 coming from Detroit, Thus, the pumps to be installed should have the minimum capacity to dose to achieve the 3-4 mg/L as PO4 level (1-1.3 mg/L as P), with extra capacity to achieve 4-6 mg/L as PO4 (1.3 to 2 mg/L as P), to assure that they could overcome an estimated system pipe wall demand. So, the design max dosage for the pumps should be 6 mg/L as PO4 – (the minimum amount of phosphate received from Detroit, in mg/L as PO4). The minimum would be 3.5 to 5 mg/L as PO4 – (the maximum amount of phosphate received from Detroit, in mg/L as PO4).

I seem to recall that we were assured on our phone call the other day that the changes were being made to address our concerns, but that the units were in mg/L as P. Since the conversion factor of P to PO4 is 3, then clearly, the target residual would be about 1-1.3 mg/L as P, but it looks like the units are PO4 in this permit. They say the max design dosage would be 1.5 mg/L, which is still a little low, if the units truly are mg/L as P (4.5 mg/L supplement on top of received water). But I'm really confused by the level they say is received from Detroit, because they very explicitly say "as PO4" in the engineering report that is the basis for the permit request, not as "P."

I'm thinking some water samples should be taken for alkalinity and orthophosphate (or total P, given it's a phosphoric acid product, for convenience of analysis and preservation) and have your R5 laboratory analyze them, so that we can be sure of the phosphate and alkalinity levels.

--Mike

Tim,

I agree with Mike that there appears to be an issue with the orthophosphate being reported as P or as PO4. The language we were discussing stated:

DWSD supplied water is currently dosed at 0.39 mg/L as P (1.2 mg/L as PO4) slightly above DWSD's OCCT requirement to dose a minimum of 0.9 mg/L as PO4 and have a minimum plant tap residual of 0.8 mg/L as PO4. DWSD plant tap residuals have been shown to consistently be at 0.39 mg/L as P (1.2 mg/L as PO4). In addition water supply entering Flint has been tested and so far shown to contain approximately 0.39 mg/L as P (1.2 mg/L as PO4) as well.

To achieve pipe passivation Flint will boost orthophosphate dosage to establish a minimum distribution residual of 1.0 mg/L as P (3.1 mg/L as PO4). The chemical feed system will be sized to achieve a dose up to 2.0 mg/L as P (6.1 mg/L as PO4) in case orthophosphate loss is observed.

The language on the PO4 permit is a bit different in a couple of areas:

It states that a dosage of 0.8 mg/L as PO4 has been recommended for the Detroit water. This seems inconsistent with the above DWSD's OCCT requirement for a minimum of 0.9 mg/L and the current dose of 1.2 mg/L as PO4.

In the first paragraph of the permit, the units are expressed as mg/L as PO4. In the third paragraph, the permit states that the arriving water from Detroit will have some residual PO4 and it has been reported that this residual will be approximately 0.4 mg/L The permit does not specify the units here. Based on the information that we were discussing (and excerpted above), it appears that it is approximately 0.4 mg/L as P or 1.2 mg/L as PO4. Thus, it appears that the permit is not using consistent units between the first and third paragraphs. I think the permit needs to either use consistent reporting units or even better spell out as P or as PO4 in every instance to avoid problems.

Hope that helps.

Jeff

Subject: RE: Flint Task Force -- MDEQ PO4 permit
Importance: High

Tim;

There is a unit “issue” in the section of phosphate dosages. In our phone call the other day, DEQ indicate the units discussed were mg/L as P, when we questioned how much phosphate was being consumed in the Flint system from the Detroit water feed This also came up in a prior discussion on the phone Darren and I had with DEQ about observations of phosphate loss, even within Detroit. The recommendations Darren and I provided for an initial dose of a total amount of PO4 (as PO4), were that the target residual to the estimated theoretical point of diminishing returns to optimize phosphate (in lieu of having it be determined by actual pilot testing) should be in the 3-4 mg/L as PO4 neighborhood, closer to 4.

At this time (but not when they change water supplies!) they only need to supplement the PO4 coming from Detroit, Thus, the pumps to be installed should have the minimum capacity to dose to achieve the 3-4 mg/L as PO4 level (1-1.3 mg/L as P), with extra capacity to achieve 4-6 mg/L as PO4 (1.3 to 2 mg/L as P), to assure that they could overcome an estimated system pipe wall demand. So, the design max dosage for the pumps should be 6 mg/L as PO4 – (the minimum amount of phosphate received from Detroit, in mg/L as PO4). The minimum would be 3.5 to 5 mg/L as PO4 – (the maximum amount of phosphate received from Detroit, in mg/L as PO4).

I seem to recall that we were assured on our phone call the other day that the changes were being made to address our concerns, but that the units were in mg/L as P. Since the conversion factor of P to PO4 is 3, then clearly, the target residual would be about 1-1.3 mg/L as P, but it looks like the units are PO4 in this permit. They say the max design dosage would be 1.5 mg/L, which is still a little low, if the units truly are mg/L as P (4.5 mg/L supplement on top of received water). But I'm really confused by the level they say is received from Detroit, because they very explicitly say "as PO4" in the engineering report that is the basis for the permit request, not as "P."

I'm thinking some water samples should be taken for alkalinity and orthophosphate (or total P, given it's a phosphoric acid product, for convenience of analysis and preservation) and have your R5 laboratory analyze them, so that we can be sure of the phosphate and alkalinity levels.

--Mike

Bob –

I knew it would be difficult to convene a call of all of the TF members this afternoon, so I sought their feedback on a draft message to the state by means of email. I got responses back from Jeff, Tom and Darren. I called and spoke with Mike. All responded favorably. I did not hear back from Miguel, but I understand that he is off for the day. Tom informed me that his earlier discussion with Miguel confirmed that he supported sending such a message and that he did not believe that Miguel would have any issue with how the message was written. Based on this feedback, I believe that the message below represents the position of the TF and encourage you to send it to Jim.

Recommended Message to go to Jim Sygo, cc to Natasha Henderson:

Jim –

On behalf of the Task Force, thank you for the opportunity to discuss and comment on the corrosion control plan for Flint. We are encouraged to hear that yesterday Michigan issued the permit to Flint for installation of the equipment needed for phosphate addition for corrosion control treatment. The Task Force believes that the instructions in the plan regarding the form of phosphate, dosage, and equipment sizing are clear and that Flint needs to begin to implement the additional corrosion control treatment as soon as possible.

I agree as well. On a related note - For the school and OCCT efforts, if the CRL is going to provide analytical support I will need to prepare a QAPP as soon as possible so that we are ready on our end. This issue was left somewhat up in the air so I just wanted to point that out as it would take about a week to define the scope of work for each of these efforts and to get the QAPP finalized. We would also need to give the lab folks a heads-up asap so that they have adequate supplies on hand.

I agree will all that has already been pointed out. We also mentioned doing a simple pH check to make sure the target phosphate dose does not significantly impact pH. I do not see mention of this.

Subject: Re: Corrosion Control Plan

Thanks, all. New question for us. It appears that the permit issued may have not taken account of some of the comments we provided. MDEQ assured me the letter to Flint, expected later today, will take account of those comments. I'm have held off sending the message below until we all agree that the letter is adequate (and enforceable). I will this morning share our concerns with MDEQ. Does that sound OK?

FYI, Tim is not available today.

Recommended Message to go to Jim Sygo, cc to Natasha Henderson:

Jim –

On behalf of the Task Force, thank you for the opportunity to discuss and comment on the corrosion control plan for Flint. We are encouraged to hear that yesterday Michigan issued the permit to Flint for installation of the equipment needed for phosphate addition for corrosion control treatment. The Task Force believes that the instructions in the plan regarding the form of phosphate, dosage, and equipment sizing are clear and that Flint needs to begin to implement the additional corrosion control treatment as soon as possible.

Hi all –

Just a quick note regarding the meeting in Flint. We are looking at hotel accommodations for the evening of the 9th and will let you know what looks to be available. We would like to be able to have a short face-to-face meeting before the official meeting on the 10th and it may be that the only available time would be the evening of the 9th at the hotel or maybe over dinner…we will see if that works out.

Also, it would be helpful to get your thoughts about what we want to make sure we cover or see or do while we are in Flint beyond the 10:00 meeting. For example, do we want to get to the treatment plant to see its condition and where they will be installing equipment for orthophosphate addition? Please let us know and we will see what we can arrange.

Task Force Members –

Thanks for a very good call today with MDEQ. Ideally, we would have had a pre-call to discuss and present our concerns. Thanks for your flexibility in handling our concerns about laboratory certification at the outset of the call.

Also, since we are not in the same room, it's sometimes hard to know when and if we have heard all voices. Please know that I never mean to cut short any discussion – if you feel we need to continue on a subject, or if we have not fully considered something, I encourage you to speak up. Please feel free, and know that my attempts to find agreement and move to the next subject should never be construed as an attempt to limit full and robust discussion.

We should all plan to be in Flint on the morning of Nov. 10. Please start making your travel arrangements now. Details to follow.

Thanks,

Bob

Tim,

In addition to WQTC being that week, it is also the same week as the National Drinking Water Advisory Council meeting, which is why I won't be at WQTC this year. The NDWAC will be deliberating Tuesday afternoon and all day Wednesday on the NDWAC Working Group report so that they can provide final recommendations to EPA on revisions to the Lead and Copper Rule.

Tim;

Thanks for clearly representing our concerns about the certified labs today. I am still concerned that the requirement will inhibit other studies that need to be done—the pilot testing and assessment kinds of investigations that are engineering/corrosion control "best practices," not LCR requirements. Plus, testing diagnostic testing protocols to determine best what does and doesn't work, such as techniques for sampling to detect LSLs, and sampling programs for buildings that better locate contamination or reflect more on resident exposure. It still sounded to me that they wanted direct control over all Pb results, regardless of the study origin. Maybe we in EPA should talk about this some more?

The other thing which really annoys me is AGAIN scheduling the Technical Advisory committee meeting with zero consultation with the technical "experts." I had to miss the last one, and Darren, myself, and Marc Edwards, all are going to be at WQTC. Jeff usually goes. That conference is the most important technical drinking water conference of the year, and the dates are well known. I might even add, shouldn't some of the others be going there, too, given the many treatment and sampling issues that have become so clear in the last few months?

Team,

The next Technical Advisory Meeting is set for **Wednesday November 18th 2:00 pm** at Flint City Hall. The previous date being considered was Veterans Day and we encountered several conflicts. There will be a call in number available and I will send an agenda prior to the meeting.

There is a significant amount of new information included in this weekly report and I expect that trend to continue as we move forward. Several of the items mentioned such as the specific dosing level of phosphate will become targets of discussion at this next meeting in order to thoroughly evaluate the pros and cons and to help with public information.

The testing map continues to have information added as it becomes available and on the weekly report we have inserted a data table that will be updated regularly as well. Please let me know if anyone is interested in additional data being reported.

Please be prepared to give input on the potential of a December meeting which would have to be December 9th or December 16th.

Thank you,

--

Draft Flint CCT operation letter.docx

Task Force,

Attached is MDEQ's draft corrosion control letter to Flint to accompany the permit I sent around yesterday.

Two things – First, MDEQ tells me that this letter will be enforceable via a state reg, as if part of the permit. Second, MDEQ tells me that the letter takes account of our feedback to date, including the units issue raised concerning the permit yesterday.

Please review. DEQ intends to send this letter today. While it would be good to accommodate that schedule, we *do not want to rush or otherwise cut off any necessary EPA review.* Please let me know your thoughts, **including whether the time constraints on the review are feasible or not**.

Thanks, all.

STATE OF MICHIGAN
DEPARTMENT OF ENVIRONMENTAL QUALITY
LANSING DISTRICT OFFICE

RICK SNYDER
GOVERNOR

DAN WYANT
DIRECTOR

October 30, 2015

Mr. Mike Glasgow
Utilities Administrator
City of Flint
4500 North Dort Highway
Flint, Michigan 48505

Dear Mr. Glasgow:

SUBJECT: Water Supply – City of Flint (City) – Corrosion Control Treatment Operation

The purpose of this letter is to outline additional requirements and recommendations regarding the additional corrosion control treatment measures being taken by the City water system.

The City has been purchasing drinking water from the Detroit Water and Sewerage Department (DWSD)/Great Lakes Water Authority (GLWA) since Friday, October 16, 2015. DWSD/GLWA provides corrosion control treatment to its water and DWSD/GLWA has been deemed by the Michigan Department of Environmental Quality (MDEQ) to have fully optimized corrosion control treatment. This optimization requires DWSD/GLWA to provide orthophosphate addition, maintain a minimum dose of 0.9 milligrams per liter (mg/L) as PO_4, and maintain a DWSD/GLWA plant tap residual of 0.8 mg/L as PO_4. As part of its optimization, DWSD/GLWA is also required to maintain a minimum pH of 7.0 at the DWSD/GLWA plant tap.

DRAFT

Corrosion Control Treatment and Operation

To further enhance pipe passivation in the City water distribution system, customer service lines, and customer plumbing, **the City shall dose additional orthophosphate to increase distribution system phosphate residual to a minimum of 3.1 mg/L as PO_4 (1.0 mg/L as P).** The City has obtained a Michigan Safe Drinking Water Act, 1976 PA 399, as amended (Act 399), water system construction permit for the installation of this treatment equipment at Control Station 2 and Pump Station 4, construction permit number W151104, issued on October 28, 2015.

The City should also maintain a minimum pH level of 7.0 throughout the City's water distribution system. If pH levels of 7.0 or less are detected, the City shall immediately notify the MDEQ.

As part of the City water system operations, the City shall conduct:

- **Daily monitoring of incoming DWSD/GLWA water for pH and for orthophosphate residual, as PO_4**
- **Daily monitoring of additional orthophosphate dosage, as PO_4**
- **Daily monitoring of water entering the City distribution system for pH and for orthophosphate residual, as PO_4**

This information shall be included in the City's monthly operation report and shall be reported to the MDEQ as required under Administrative Rule 1502 (R 325.11502) of the administrative rules promulgated pursuant to Act 399.

Enhanced Water Quality Parameter Monitoring

The City's revised monitoring schedule dated October 22, 2015, requires quarterly Water Quality Parameter Monitoring at 25 sites throughout the City's water distribution system for temperature (Celcius), Conductivity (mS), pH, Total Alkalinity (mg/L as $CaCO_3$), Calcium (mg/L as Ca^{2+}), and orthophosphate (mg/L PO_4). Ten of these 25 sites are also used by the City to conduct required total coliform bacteria and chlorine residual monitoring (location numbers 1, 2, 3, 4, 5, 6, 7, 8, CS, and WS). **At these ten locations the City shall also conduct weekly monitoring for the following parameters at the same time that total coliform bacteria and chlorine residual monitoring is conducted to further assess water stability:**

- **Turbidity (NTU)**
- **Iron (mg/L)**
- **Orthophosphate (mg/L PO_4)**
- **pH**
- **Total Alkalinity (mg/L as $CaCO_3$)**
- **Calcium (mg/L as Ca^{2+})**
- **Chloride (mg/L as Cl^-)**
- **Temperature (Celcius)**
- **Conductivity (mS)**

If orthophosphate residual levels less than 3.1 mg/L as PO_4 (1.0 mg/L as P) are detected at any of these locations, then orthophosphate dosage shall be increased to achieve the minimum phosphate residual of 3.1 mg/L as PO_4 (1.0 mg/L as P) at all locations. In addition, if pH levels of 7.0 or less are detected at any of these locations, the City shall immediately notify the MDEQ.

Corrosion Control Treatment Test Loops

To further confirm the effectiveness of corrosion control treatment and the City's operations, it is recommended that the City construct, install, and monitor test loops of service line and plumbing materials. Instructions for construction, installation, and monitoring of these test loops can be obtained from the United States Environmental Protection Agency's (U.S. EPA) Office of Research and Development. Please contact Mr. Darren Lytle, Acting Branch Chief, at 512-569-7432 or lytle.darren@epa.gov.

Lead Service Line Verification Sampling

The City has been reviewing customer service connection records in order to confirm customer service line materials at each connection. The U.S. EPA has developed a sampling procedure that can be used to help verify the presence of lead service lines and it is recommended that the City conduct this sampling at a selection of customer locations for this purpose. Information regarding this verification sampling can also be obtained from Mr. Lytle. Any water analysis for lead and copper is expected to be completed by a certified lab.

Customer Household Exposure Assessment

The Michigan Department of Health and Human Services (MDHHS) is continuing to conduct blood lead level testing for children in the City. Families with children found to have elevated blood lead levels will be asked to have an elevated blood lead level investigation conducted at

DRAFT

their residence that will include a lead exposure assessment, including the contribution of lead from water service lines and premise plumbing. This diagnostic testing is different than the first draw sampling being conducted by the City and should help further substantiate the effectiveness of corrosion control treatment. Any water analysis for lead and copper is expected to be completed by a certified lab. It is recommended that any additional research monitoring should be further evaluated by the City's Technical Advisory Committee prior to being conducted.

Flint Water Treatment Plant Evaluation of Karegnondi Water Authority (KWA) Raw Water

The City is planning to change source water in the next year to raw water from Lake Huron purchased from the KWA. The City is required to evaluate the Flint Water Treatment Plant (WTP) processes related to optimization of corrosion control treatment using source water purchased from the KWA to determine if any adjustments are necessary. It is recognized that full scale testing at the Flint WTP may not be feasible. A report of this evaluation shall be provided to our office for review and approval prior to initiating service of this treated water to its customers.

If you have any questions regarding this correspondence, please contact me at the number below or at prysbym@michigan.gov.

Subject: RE: Urgent -- Task Force Review of Permit and Letter

I need to get a “go” or “no go” response from everyone on whether you think MDEQ’s letter to Flint covers everything that we want it to for the supplemental addition of orthophosphate.

They are requiring:

the additional dose to be a minimum of 3.1 mg/L as PO4

a minimum pH of 7.0 throughout the distribution system

daily monitoring of pH and orthophosphate residual as PO4 from Detroit

daily monitoring of additional orthophosphate dosage as PO4

daily monitoring of pH and ortho residual

monitoring for enhanced WQP (turbidity, iron, ortho, pH, total alkalinity, calcium, chloride, temp, conductivity)

recommending CCT test loops be constructed

confirmation of LSLs

additional lead exposure research monitoring be evaluated by the TAC

evaluate CCT with respect to the Karegnondi Water pipeline.

Is there anything missing or can MDEQ send the letter out? Please provide me with any comments so I can consolidate.

Thanks.

Draft Flint CCT operation letter mdt.docx

My comments...

As we would be relying on ORD for their technical review of any data, I will defer to ORD as far the parametric data they need. On the rest of the letter...I thought we had resolved the 'certified lab' issue but I see they still include that statement which I don't understand. Did I miss something? Some additional suggested edits as well.

Dear Mr. Glasgow:

SUBJECT: Water Supply – City of Flint (City) – Corrosion Control Treatment Operation

The purpose of this letter is to outline additional requirements and recommendations regarding the additional corrosion control treatment measures being taken by the City water system.

The City has been purchasing drinking water from the Detroit Water and Sewerage Department (DWSD)/Great Lakes Water Authority (GLWA) since Friday, October 16, 2015. DWSD/GLWA provides corrosion control treatment to its water and DWSD/GLWA has been deemed by the Michigan Department of Environmental Quality (MDEQ) to have fully optimized corrosion control treatment. This optimization requires DWSD/GLWA to provide orthophosphate addition, maintain a minimum dose of 0.9 milligrams per liter (mg/L) as PO_4, and maintain a DWSD/GLWA plant tap residual of 0.8 mg/L as PO_4. As part of its optimization, DWSD/GLWA is also required to maintain a minimum pH of 7.0 at the DWSD/GLWA plant tap.

DRAFT

Corrosion Control Treatment and Operation

To further enhance pipe passivation in the City water distribution system, customer service lines, and customer plumbing, **the City shall dose additional orthophosphate to increase distribution system phosphate residual to a minimum of 3.1 mg/L as PO_4 (1.0 mg/L as P).** The City has obtained a Michigan Safe Drinking Water Act, 1976 PA 399, as amended (Act 399), water system construction permit for the installation of this treatment equipment at Control Station 2 and Pump Station 4, construction permit number W151104, issued on October 28, 2015.

The City should also maintain a minimum pH level of 7.0 throughout the City's water distribution system. If pH levels of 7.0 or less are detected, the City shall immediately notify the MDEQ.

As part of the City water system operations, the City shall conduct:

- **Daily monitoring of incoming DWSD/GLWA water for pH and for orthophosphate residual, as PO_4**
- **Daily monitoring of additional orthophosphate dosage, as PO_4**
- **Daily monitoring of water entering the City distribution system for pH and for orthophosphate residual, as PO_4**

This information shall be included in the City's monthly operation report and shall be reported to the MDEQ as required under Administrative Rule 1502 (R 325.11502) of the administrative rules promulgated pursuant to Act 399.

Enhanced Water Quality Parameter Monitoring

The City's revised monitoring schedule dated October 22, 2015, requires quarterly Water Quality Parameter Monitoring at 25 sites throughout the City's water distribution system for temperature (Celcius), Conductivity (mS), pH, Total Alkalinity (mg/L as $CaCO_3$), Calcium (mg/L as Ca^{2+}), and orthophosphate (mg/L PO_4). Ten of these 25 sites are also used by the City to conduct required total coliform bacteria and chlorine residual monitoring (location numbers 1, 2, 3, 4, 5, 6, 7, 8, CS, and WS). **At these ten locations the City shall also conduct weekly monitoring for the following parameters at the same time that total coliform bacteria and chlorine residual monitoring is conducted to further assess water stability:**

- **Turbidity (NTU)**
- **Iron (mg/L)**
- **Orthophosphate (mg/L PO_4)**
- **pH**
- **Total Alkalinity (mg/L as $CaCO_3$)**
- **Calcium (mg/L as Ca^{2+})**
- **Chloride (mg/L as Cl^-)**
- **Temperature (Celcius)**
- **Conductivity (mS)**

If orthophosphate residual levels less than 3.1 mg/L as PO_4 (1.0 mg/L as P) are detected at any of these locations, then orthophosphate dosage shall be increased to achieve the minimum phosphate residual of 3.1 mg/L as PO_4 (1.0 mg/L as P) at all locations. In addition, if pH levels of 7.0 or less are detected at any of these locations, the City shall immediately notify the MDEQ.

Corrosion Control Treatment Test Loops

To further confirm the effectiveness of corrosion control treatment and the City's operations, it is recommended that the City construct, install, and monitor test loops of service line and plumbing materials. Instructions for construction, installation, and monitoring of these test loops can be obtained from the United States Environmental Protection Agency's (U.S. EPA) Office of Research and Development. The US. EPA has also offered to provide analytical services to support this effort [at no cost to the City of Flint?] [free of charge?]. Please contact Mr. Darren Lytle, Acting Branch Chief, at
512-569-7432 or lytle.darren@epa.gov.

Lead Service Line Verification Sampling

The City has been reviewing customer service connection records in order to confirm customer service line materials at each connection. The U.S. EPA has developed a sampling procedure that can be used to help verify the presence of lead service lines and it is recommended that the City conduct this sampling at a selection of customer locations for this purpose. Information regarding this verification sampling can also be obtained from Mr. Lytle. Any water analysis for lead and copper is expected to be completed by a certified lab. Alternatively, the City of Flint may wish to conduct this sampling in cooperation with the U.S. EPA, which has offered to provide analytical services for the LSL verification sampling [at no cost to the City of Flint?] [free of charge?].

DRAFT

Customer Household Exposure Assessment

The Michigan Department of Health and Human Services (MDHHS) is continuing to conduct blood lead level testing for children in the City. Families with children found to have elevated blood lead levels will be asked to have an elevated blood lead level investigation conducted at their residence that will include a lead exposure assessment, including the contribution of lead from water service lines and premise plumbing. This diagnostic testing is different than the first draw sampling being conducted by the City and should help further substantiate the effectiveness of corrosion control treatment. Any water analysis for lead and copper is expected to be completed by a certified lab. Alternatively, the City of Flint may wish to conduct the LSL sampling in cooperation with the U.S. EPA, which has offered to provide analytical services for the LSL sampling free of charge. It is also recommended that any additional research monitoring should be further evaluated by the City's Technical Advisory Committee prior to being conducted.

Flint Water Treatment Plant Evaluation of Karegnondi Water Authority (KWA) Raw Water

The City is planning to change source water in the next year to raw water from Lake Huron purchased from the KWA. The City is required to evaluate the Flint Water Treatment Plant (WTP) processes related to optimization of corrosion control treatment using source water purchased from the KWA to determine if any adjustments are necessary. It is recognized that full scale testing at the Flint WTP may not be feasible. A report of this evaluation shall be provided to our office for review and approval prior to initiating service of this treated water to its customers.

If you have any questions regarding this correspondence, please contact me at the number below or at prysbym@michigan.gov.

Subject: Re: Urgent -- Task Force Review of Permit and Letter
Importance: High

My comments...

As we would be relying on ORD for their technical review of any data, I will defer to ORD as far the parametric data they need. On the rest of the letter...I thought we had resolved the 'certified lab' issue but I see they still include that statement which I don't understand. Did I miss something? Some additional suggested edits as well.

Subject: Urgent -- Task Force Review of Permit and Letter

Task Force,

Attached is MDEQ's draft corrosion control letter to Flint to accompany the permit I sent around yesterday.

Two things – First, MDEQ tells me that this letter will be enforceable via a state reg, as if part of the permit. Second, MDEQ tells me that the letter takes account of our feedback to date, including the units issue raised concerning the permit yesterday.

Please review. DEQ intends to send this letter today. While it would be good to accommodate that schedule, we *do not want to rush or otherwise cut off any necessary EPA review.* Please let me know your thoughts, **including whether the time constraints on the review are feasible or not**.

Thanks, all.

I agree with Miguel's observations. I would make a note that the EPA lead analysis would be supported by the regional lab (correct?) because I do not think we could take on the load in a timely turnaround. Under enhanced water quality monitoring, the parameter list looks complete and I would only add that an additional sample be added to the list of 10 that is the entry point to the DS.

Subject: RE: Urgent -- Task Force Review of Permit and Letter

Tom,

They have addressed my concerns based on their statement during our last call that all of the lead and copper samples will be analyzed by the State lab, since that it is the only way the State can pay for the analyses and that lab is a certified lab. I am assuming that since they did not specify certified labs for the pipe loop monitoring, that the Regional or ORD or uncertified University labs could be used to analyze those samples. I am not sure how long the State is committed to analyzing the samples, but they may want to allow themselves some flexibility on the certified lab requirement for the lead service line verification samples if Flint may continue to do these samples after the State's commitment ends.

The letter is vastly improved over the permit on the phosphate dosing units issue and does reflect the recommendations on the supplemental dose.

Let me know if you have any questions. Thanks.

Subject: RE: Urgent -- Task Force Review of Permit and Letter

I need to get a "go" or "no go" response from everyone on whether you think MDEQ's letter to Flint covers everything that we want it to for the supplemental addition of orthophosphate.

They are requiring:

the additional dose to be a minimum of 3.1 mg/L as PO4

a minimum pH of 7.0 throughout the distribution system

daily monitoring of pH and orthophosphate residual as PO4 from Detroit

daily monitoring of additional orthophosphate dosage as PO4

daily monitoring of pH and ortho residual

monitoring for enhanced WQP (turbidity, iron, ortho, pH, total alkalinity, calcium, chloride, temp, conductivity)

recommending CCT test loops be constructed

confirmation of LSLs

additional lead exposure research monitoring be evaluated by the TAC

evaluate CCT with respect to the Karegnondi Water pipeline.

Is there anything missing or can MDEQ send the letter out? Please provide me with any comments so I can consolidate.

Thanks.

Hi Darren

I was referring to the CRL here for the analytical support. Our lab folks said they could provide whatever support was needed for Flint (Pb, Cu, other) and in discussions with Mike, it seemed that was what he really preferred because our lab can analyze for other parameters that we like will not get if they use another lab.

All - Just as a couple of examples of the value added...the samples from the Citizen name / Ex. 6 home included parameters that are not normally ever tested for (Aluminum, Phosphate, Zinc, and more) and analyzing that data showed strong correlations among certain parameters that was instrumental in helping us determine that the source of the high lead was dislodged scale from the pipes. Data from similar analyses of particulate lead found in the aerators in some homes also showed this same Pb/Al/P correlation, indicating once again that the lead-bearing scale is the source. We ran other parameters as well and the absence of some of the other constituents can be just as valuable as the presence of the ones that are found. We would lose a lot of information without that. This would be a good opportunity to show folks the value of doing this for future use.

Subject: Re: Urgent -- Task Force Review of Permit and Letter

Hi Darren

I was referring to the CRL here for the analytical support. Our lab folks said they could provide whatever support was needed for Flint (Pb, Cu, other) and in discussions with Mike, it seemed that was what he really preferred because our lab can analyze for other parameters that we like will not get if they use another lab.

All - Just as a couple of examples of the value added...the samples from the Citizen name / Ex. 6 home included parameters that are not normally ever tested for (Aluminum, Phosphate, Zinc, and more) and analyzing that data showed strong correlations among certain parameters that was instrumental in helping us determine that the source of the high lead was dislodged scale from the pipes. Data from similar analyses of particulate lead found in the aerators in some homes also showed this same Pb/Al/P correlation, indicating once again that the lead-bearing scale is the source. We ran other parameters as well and the absence of some of the other constituents can be just as valuable as the presence of the ones that are found. We would lose a lot of information without that. This would be a good opportunity to show folks the value of doing this for future use.

I agree with Miguel's observations. I would make a note that the EPA lead analysis would be supported by the regional lab (correct?) because I do not think we could take on the load in a timely turnaround. Under enhanced water quality monitoring, the parameter list looks complete and I would only add that an additional sample be added to the list of 10 that is the entry point to the DS.

My comments...

As we would be relying on ORD for their technical review of any data, I will defer to ORD as far the parametric data they need. On the rest of the letter...I thought we had resolved the 'certified lab' issue but I see they still include that statement which I don't understand. Did I miss something? Some additional suggested edits as well.

Task Force,

Attached is MDEQ's draft corrosion control letter to Flint to accompany the permit I sent around yesterday.

Two things – First, MDEQ tells me that this letter will be enforceable via a state reg, as if part of the permit. Second, MDEQ tells me that the letter takes account of our feedback to date, including the units issue raised concerning the permit yesterday.

Please review. DEQ intends to send this letter today. While it would be good to accommodate that schedule, we *do not want to rush or otherwise cut off any necessary EPA review.* Please let me know your thoughts, **including whether the time constraints on the review are feasible or not**.

Thanks, all.

It may help to include something along the lines of my last email in the intro when our comments are sent…

We encourage the City to take advantage of U.S. EPA's offer for analytical support as our laboratory can analyze for a more robust set of parameters.The presence or absence of these additional parameters has provided valuable information and insights in past efforts on identifying potential sources of lead.

Tom,

I don't think we want to call the lead and copper tap samples as compliance sample in the lead service line verification program as they are not truly compliance samples – the OWQPs will be the compliance samples. We could call them samples that meet the criteria for inclusion in the 90th percentile lead and copper level calculations must be done by a certified laboratory.

In the customer household exposure assessment, I don't think we want to say these must be done by a certified lab – the change works in the previous section because the samples can include first draw and thus be included in the 90th percentile calculation. I think the "is expected to be" along with the EPA offer may provide more flexibility.

From past conversations, I think the State wanted all of the sampling to be done by certified labs, regardless. They said the same on the school sampling, none of which is compliance sampling since they are not regulated PWSs. I think they are just looking for certainty in the validity of the results.

Tom,

I don't think we want to call the lead and copper tap samples as compliance sample in the lead service line verification program as they are not truly compliance samples – the OWQPs will be the compliance samples. We could call them samples that meet the criteria for inclusion in the 90th percentile lead and copper level calculations must be done by a certified laboratory.

In the customer household exposure assessment, I don't think we want to say these must be done by a certified lab – the change works in the previous section because the samples can include first draw and thus be included in the 90th percentile calculation. I think the "is expected to be" along with the EPA offer may provide more flexibility.

Jeff

Hi Darren

I was referring to the CRL here for the analytical support. Our lab folks said they could provide whatever support was needed for Flint (Pb, Cu, other) and in discussions with Mike, it seemed that was what he really preferred because our lab can analyze for other parameters that we like will not get if they use another lab.

All - Just as a couple of examples of the value added...the samples from the Citizen name / Ex. 6 home included parameters that are not normally ever tested for (Aluminum, Phosphate, Zinc, and more) and analyzing that data showed strong correlations among certain parameters that was instrumental in helping us determine that the source of the high lead was dislodged scale from the pipes. Data from similar analyses of particulate lead found in the aerators in some homes also showed this same Pb/Al/P correlation, indicating once again that the lead-bearing scale is the source. We ran other parameters as well and the absence of some of the other constituents can be just as valuable as the presence of the ones that are found. We would lose a lot of information without that. This would be a good opportunity to show folks the value of doing this for future use.

I agree with Miguel's observations. I would make a note that the EPA lead analysis would be supported by the regional lab (correct?) because I do not think we could take on the load in a timely turnaround. Under enhanced water quality monitoring, the parameter list looks complete and I would only add that an additional sample be added to the list of 10 that is the entry point to the DS.

My comments...

As we would be relying on ORD for their technical review of any data, I will defer to ORD as far the parametric data they need. On the rest of the letter...I thought we had resolved the 'certified lab' issue but I see they still include that statement which I don't understand. Did I miss something? Some additional suggested edits as well.

Task Force,

Attached is MDEQ's draft corrosion control letter to Flint to accompany the permit I sent around yesterday.

Two things – First, MDEQ tells me that this letter will be enforceable via a state reg, as if part of the permit. Second, MDEQ tells me that the letter takes account of our feedback to date, including the units issue raised concerning the permit yesterday.

Please review. DEQ intends to send this letter today. While it would be good to accommodate that schedule, we *do not want to rush or otherwise cut off any necessary EPA review.* Please let me know your thoughts, **including whether the time constraints on the review are feasible or not**.

Thanks, all.

Tom,

Thanks. I agree that the first draw in a sequence will likely meet the criteria for inclusion in the 90th percentile and should be done by a certified lab. The term "compliance" can lead to the misinterpretation that the action level is the compliance level for Flint and that was my concern.

Hi Darren

I was referring to the CRL here for the analytical support. Our lab folks said they could provide whatever support was needed for Flint (Pb, Cu, other) and in discussions with Mike, it seemed that was what he really preferred because our lab can analyze for other parameters that we like will not get if they use another lab.

All - Just as a couple of examples of the value added...the samples from the Walters home included parameters that are not normally ever tested for (Aluminum, Phosphate, Zinc, and more) and analyzing that data showed strong correlations among certain parameters that was instrumental in helping us determine that the source of the high lead was dislodged scale from the pipes. Data from similar analyses of particulate lead found in the aerators in some homes also showed this same Pb/Al/P correlation, indicating once again that the lead-bearing scale is the source. We ran other parameters as well and the absence of some of the other constituents can be just as valuable as the presence of the ones that are found. We would lose a lot of information without that. This would be a good opportunity to show folks the value of doing this for future use.

Subject: RE: Urgent -- Task Force Review of Permit and Letter

I agree with Miguel's observations. I would make a note that the EPA lead analysis would be supported by the regional lab (correct?) because I do not think we could take on the load in a timely turnaround. Under enhanced water quality monitoring, the parameter list looks complete and I would only add that an additional sample be added to the list of 10 that is the entry point to the DS.

Importance: High

My comments...

As we would be relying on ORD for their technical review of any data, I will defer to ORD as far the parametric data they need. On the rest of the letter...I thought we had resolved the 'certified lab' issue but I see they still include that statement which I don't understand. Did I miss something? Some additional suggested edits as well.

Subject: Urgent -- Task Force Review of Permit and Letter

Task Force,

Attached is MDEQ's draft corrosion control letter to Flint to accompany the permit I sent around yesterday.

Two things – First, MDEQ tells me that this letter will be enforceable via a state reg, as if part of the permit. Second, MDEQ tells me that the letter takes account of our feedback to date, including the units issue raised concerning the permit yesterday.

Please review. DEQ intends to send this letter today. While it would be good to accommodate that schedule, we *do not want to rush or otherwise cut off any necessary EPA review.* Please let me know your thoughts, **including whether the time constraints on the review are feasible or not**.

Thanks, all.

Tom,

I think we need to delete the word compliance from that sentence as Flint is a large system, so meeting the action level does not ensure compliance with the rule.

Tom,

I don't think we want to call the lead and copper tap samples as compliance sample in the lead service line verification program as they are not truly compliance samples – the OWQPs will be the compliance samples. We could call them samples that meet the criteria for inclusion in the 90th percentile lead and copper level calculations must be done by a certified laboratory.

In the customer household exposure assessment, I don't think we want to say these must be done by a certified lab – the change works in the previous section because the samples can include first draw and thus be included in the 90th percentile calculation. I think the "is expected to be" along with the EPA offer may provide more flexibility.

Bob,

Thanks for the edits. Attached is a copy of the letter sent to the City of Flint today. We have made some minor edits but did emphasize that EPA is available for doing analysis and that a certified lab must analyze any sample that will be used tin the calculation of the 90 percentile of the Lead/Copper rule. We also added the additional point for sampling beyond the ten identifies.

Thanks for your assistance and your quick turn around.

DEQ will be sampling 2 more schools on Saturday as we discussed earlier in the week. Plumbing assessments were completed today.

Sent: Friday, October 30, 2015 4:26 PM
To: Sygo, Jim (DEQ)
Subject: EPA Task Force comments on letter sending Flint Corrosion Control Permit

Jim,

On behalf of the Task Force, thank you for sending us the corrosion control plan letter this morning for our review. Attached please find EPA's edits to that letter. We also understand that MDEQ will issue an amended permit shortly to take account of the Task Force's comments sent to you today.

EPA encourages the City to take advantage of our offer for analytical support as our laboratory can analyze for a more robust set of parameters. The presence or absence of these additional parameters has provided valuable information and insights in past efforts on identifying potential sources of lead.

The Task Force believes Flint should implement the additional corrosion control treatment as soon as possible. The letter and amended permit are an important step in making sure additional corrosion control takes place quickly and appropriately.

STATE OF MICHIGAN
DEPARTMENT OF ENVIRONMENTAL QUALITY
LANSING DISTRICT OFFICE

RICK SNYDER
GOVERNOR

DAN WYANT
DIRECTOR

October 30, 2015

VIA E-MAIL and U.S. MAIL

Mr. Mike Glasgow
Utilities Administrator
City of Flint
4500 North Dort Highway
Flint, Michigan 48505

Dear Mr. Glasgow:

SUBJECT: Water Supply – City of Flint (City) – Corrosion Control Treatment Operation

The purpose of this letter is to outline additional requirements and recommendations regarding the additional corrosion control treatment measures being taken by the City water system.

The City has been purchasing drinking water from the Detroit Water and Sewerage Department (DWSD)/Great Lakes Water Authority (GLWA) since Friday, October 16, 2015. DWSD/GLWA provides corrosion control treatment to its water and DWSD/GLWA has been deemed by the Michigan Department of Environmental Quality (MDEQ) to have fully optimized corrosion control treatment. This optimization requires DWSD/GLWA to provide orthophosphate addition, maintain a minimum dose of 0.9 milligrams per liter (mg/L) as PO_4, and maintain a DWSD/GLWA plant tap residual of 0.8 mg/L as PO_4. As part of its optimization, DWSD/GLWA is also required to maintain a minimum pH of 7.0 at the DWSD/GLWA plant tap.

Corrosion Control Treatment and Operation

To further enhance pipe passivation in the City water distribution system, customer service lines, and customer plumbing, **the City shall dose additional orthophosphate to increase distribution system phosphate residual to a minimum of 3.1 mg/L as PO_4 (1.0 mg/L as P).** The City has obtained a Michigan Safe Drinking Water Act, 1976 PA 399, as amended (Act 399), water system construction permit for the installation of this treatment equipment at Control Station 2 and Pump Station 4, construction permit number W151104, issued on October 28, 2015.

The City should also maintain a minimum pH level of 7.0 throughout the City's water distribution system. If pH levels of 7.0 or less are detected, the City shall immediately notify the MDEQ.

As part of the City water system operations, the City shall conduct:

- **Daily monitoring of incoming DWSD/GLWA water for pH and for orthophosphate residual, as PO_4**
- **Daily monitoring of additional orthophosphate dosage, as PO_4**
- **Daily monitoring of water entering the City distribution system for pH and for orthophosphate residual, as PO_4**

This information shall be included in the City's monthly operation report and shall be reported to the MDEQ as required under Administrative Rule 1502 (R 325.11502) of the administrative rules promulgated pursuant to Act 399.

Enhanced Water Quality Parameter Monitoring

The City's revised monitoring schedule dated October 22, 2015, requires quarterly Water Quality Parameter Monitoring at 25 sites throughout the City's water distribution system for temperature (Celcius), Conductivity (mS), pH, Total Alkalinity (mg/L as $CaCO_3$), Calcium (mg/L as Ca^{2+}), and orthophosphate (mg/L PO_4). Ten of these 25 sites are also used by the City to conduct required total coliform bacteria and chlorine residual monitoring (location numbers 1, 2, 3, 4, 5, 6, 7, 8, CS, and WS). **At these ten locations, the City shall also conduct weekly monitoring for the following parameters at the same time that total coliform bacteria and chlorine residual monitoring is conducted to further assess water stability:**

- **Turbidity (NTU)**
- **Iron (mg/L)**
- **Orthophosphate (mg/L PO_4)**
- **pH**
- **Total Alkalinity (mg/L as $CaCO_3$)**
- **Calcium (mg/L as Ca^{2+})**
- **Chloride (mg/L as Cl^-)**
- **Temperature (Celcius)**
- **Conductivity (mS)**

In addition to the 10 locations, the entry point to the distribution system should be one of the locations for enhanced water quality parameter monitoring.

If orthophosphate residual levels less than 3.1 mg/L as PO_4 (1.0 mg/L as P) are detected at any of these locations, then orthophosphate dosage shall be increased to achieve the minimum phosphate residual of 3.1 mg/L as PO_4 (1.0 mg/L as P) at all locations. In addition, if pH levels of 7.0 or less are detected at any of these locations, the City shall immediately notify the MDEQ.

Corrosion Control Treatment Test Loops

To further confirm the effectiveness of corrosion control treatment and the City's operations, it is recommended that the City construct, install, and monitor test loops of service line and plumbing materials. Instructions for construction, installation, and monitoring of these test loops can be obtained from the United States Environmental Protection Agency's (U.S. EPA) Office of Research and Development. The U.S. EPA has also offered to provide analytical services to support this investigative effort. Please contact Mr. Darren Lytle, Acting Branch Chief, at 512-569-7432 or lytle.darren@epa.gov.

Lead Service Line Verification Sampling

The City has been reviewing customer service connection records in order to confirm customer service line materials at each connection. The U.S. EPA has developed a sampling procedure that can be used to help verify the presence of lead service lines and it is recommended that the City conduct this sampling at a selection of customer locations for this purpose. Information regarding this verification sampling can also be obtained from Mr. Lytle. Any water analysis for samples meeting the criteria for inclusion in the 90th percentile calculation for lead and copper compliance must be completed by a certified laboratory.

Customer Household Exposure Assessment

The Michigan Department of Health and Human Services (MDHHS) is continuing to conduct blood lead level testing for children in the City. Families with children found to have elevated blood lead levels will be asked to have an elevated blood lead level investigation conducted at their residence that will include a lead exposure assessment, including the contribution of lead from water service lines and premise plumbing. This diagnostic testing is different than the first draw sampling being conducted by the City and should help further substantiate the effectiveness of corrosion control treatment. Any water analysis samples meeting the criteria for inclusion in the 90th percentile calculation for compliance purposes for lead and copper must be completed by a certified laboratory.

Flint Water Treatment Plant Evaluation of Karegnondi Water Authority (KWA) Raw Water

The City is planning to change source water in the next year to raw water from Lake Huron purchased from the KWA. The City is required to evaluate the Flint Water Treatment Plant (WTP) processes related to optimization of corrosion control treatment using source water purchased from the KWA to determine if any adjustments are necessary. It is recognized that full scale testing at the Flint WTP may not be feasible. A report of this evaluation shall be provided to our office for review and approval prior to initiating service of this treated water to its customers.

If you have any questions regarding this correspondence, please contact me at the number below or at prysbym@michigan.gov.

Sincerely,

Michael Prysby

on October 31, 2015 at 4:00 PM, updated October 31, 2015 at 4:01 PM

FLINT, MI -- In a joint effort to inform the community about lead exposure, the Genesee County Health Department and Michigan Department of Health and Human Services will be sending letters to parents.

The letters to be sent out next week will provide parents with information regarding lead testing, how to reduce lead exposure, where lead comes from, as well as other useful information. Children cane be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics, toys, and some household remedies, according to a joint news release from the GCHD and MDHHHS.

Adult jobs and hobbies -- like auto repair, stained glass and jewelry making, and ammunition handling can also put children at risk if they touch clothing or play in areas where lead is found, according to the release.

Following results that showed elevated blood lead levels for some Flint children, the GCHD and MDHHHS have worked together to develop guidance for families.

Routine lead testing should be part of a well-child visit at ages one and two, according to the release.

"This is a good time to check with your healthcare provider to make certain your child has been tested at the recommended times and if not have the test performed." said Dr. Gary Johnson, Medical Director at the Genesee County Health Department in a statement.

The GCHD and MDHHHS are issuing the following recommendations for parents:

Families who live in the city of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the city, are encouraged to get their children tested for lead poisoning at their doctor's office or the GCHD.

Families can get their water tested for lead for free by calling 810-787-6537 for details.

Families are encouraged to use an NSF Certified water filter in their home. Free filters are still available. Call 211 for information about where to pick up a free filter.

Run only cold water through the filter.

Use filtered or bottled water for drinking -- including making coffee, drink mixes, juice, and baby formula -- and cooking. Even if people boil water, the lead will stay in the water and food.

People can use unfiltered tap water for washing your hands and dishes. If people must use unfiltered water for drinking or cooking, run the tap for five minutes before using the tap water.

Safe cleaning can also reduce risk of lead exposure in homes. People can use unfiltered tap water to wipe down counter tops, mop floors, and wash clothes.

Keep children away from lead paint and dust. Use wet paper towels to clean up lead dust around windows, play areas and floors. Wash hands and toys often using soap and water.

Lastly, always was fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as calcium rich foods, iron rich foods, and foods with vitamin C.

The GCHD and MDHHHS plan to continue to provide information to the community regarding lead exposure and protecting the health of residents, according to the release. For more information click here.

http://www.clickondetroit.com/news/health-officials-to-issue-guidelines-on-lead-exposure-to-families-in-flint/36199214

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics, toys

Published On: Nov 02 2015 07:48:13 AM EST

FLINT, Mich. - Health officials have established guidelines for families on how they should respond to ongoing problems with the municipal water supply in Flint.

The Genesee County Health Department and the Michigan Department of Health and Human Services plan to send letters to parents this week with information regarding lead testing and how to reduce lead exposure after elevated blood lead levels were found in some Flint children.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics, toys, some home remedies and adult jobs or hobbies, including auto repair, stained glass and jewelry making.

The departments recommend children between the ages of 1 and 2 undergo lead testing during routine doctor visits.

They also suggest using filtered water for drinking, cooking and washing fruits.

http://www.mlive.com/lansing-news/index.ssf/2015/10/michigan_deq_audit_expanded_to.html

By Jonathan Oosting | joosting@mlive.com
on October 30, 2015 at 9:26 AM, updated October 30, 2015 at 9:34 AM

LANSING, MI — Michigan Auditor General Doug Ringler is expanding an ongoing review of the Department of Environmental Quality's water division to include response protocols related to lead contamination in Flint drinking water.

The expansion comes two weeks after a request by Senate Minority Leader Jim Ananich, D-Flint.

"The Flint water crisis was mishandled by experts from the beginning and it's inexcusable," Ananich said in a statement announcing the request earlier this month. "This audit can help answer questions and inform the independent and legislative review that is necessary."

DEQ Director Dan Wyant issued a written statement two weeks ago acknowledging the state had enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make it less corrosive.

Wyant attributed the mistake to "drinking water program staff" and replaced the head of the Office of Drinking Water and Municipal Assistance.

Ananich asked auditors to review how ODWMA ensures data it receives is accurate, what accountability measures are in place for staff who fail to follow data verification protocols or misrepresent information to the Environmental Protection Agency.

He also wants to know what policies the water office and DEQ have in place to "escalate major infractions" up the chain of command.

Auditor General Ringler, in a letter sent to Ananich this week, said he has assigned an audit team to address Ananich's questions. The audit report is expected to be released in late February of 2016.

Michigan Gov. Rick Snyder has appointed a task force to review the Flint water switch, which occurred while the city was under control of an emergency financial manager who has since denied culpability.

Ananich has also called for legislative hearings and is backing U.S. Rep. Dan Kildee's request for a federal probe.

Fenton administrators offer insight into safety of city drinking water

Posted: Saturday, October 31, 2015 9:57 am

Vera Hogan Staff Reporter

Weeks of daily news stories about the water crisis in the city of Flint have some local residents wondering, “Can it happen here?”

In order to keep Fenton residents informed and educated about the quality of city water, Fenton City Manager Lynn Markland, Department of Public Works Director Dan Czarnecki and Stephen Guy, water treatment facility superintendent, provided the following information.

The EPA issued the lead and copper rule in 1986 with implementation date of 1991. Lead that is in a domestic water supply can come from two different sources, corrosion of household plumbing systems, such as solder from pipe joints or from lead found in household fixtures, or erosion of natural deposits.

“According to our annual Water Quality Report, if present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children,” said Guy.

“Lead in drinking water is primarily from materials and components associated with service lines and home plumbing,” he added.

The city of Fenton is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components.

“When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking,” Guy said.

“If you are concerned about lead in your water, you may wish to have your water tested,” he added.

Information on lead in drinking water, testing methods, and steps residents can take to minimize exposure is available from Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

Two components cause lead in drinking water. One is lead in piping materials and the other is corrosive water.

In the lead and copper rule, tier 1 sites are most likely to leach lead into the water. Single-family homes with lead-soldered copper piping constructed after 1982 are tier 1 sites.

The city of Fenton uses sites meeting these criteria as sample sites. These sites are sampled and tested every three years as required by the Michigan Department of Environmental Quality (MDEQ).

The test results are well below the action levels set by the rule and are published in the annual water quality report.

In the case of corrosive water, the city of Fenton uses corrosion control methods to make the water less corrosive.

Corrosive effects in a water system are usually from acidic conditions developing in a system. The city of Fenton raises the pH of its water during the softening process and sends the finished water out at elevated pH levels.

The operation is such that a stable water is produced by keeping a positive Langlier saturation index, which is an approximate indicator of the degree of saturation of calcium carbonate in water. A slightly positive index deposits calcium carbonate instead of leaching material from the pipe.

Also, a corrosion inhibiting Ortho-phosphate is fed to help coat the pipes to keep material from leaching from the pipes.

The best thing for a consumer to do to combat any potential material leached from pipes is to run the water for one or two minutes prior to using it for drinking or cooking.

“The infrastructure in Fenton is old but when the plant was built (2004), a lot of old pipes were replaced,” said Guy. “Also, during the recent and ongoing Streetscape project older water mains and sewers were replaced.”

Water mains do get sediments and rust build up inside them over time and it is possible for the water to pick this up. To combat this deposition and sediment the city flushes water mains every fall.

Presently, the city pumps water from four groundwater wells from between 70 and 100 feet deep and treats it by softening.

In 2013, the city conducted a search for new well sites to try to locate a source of water that was less hard than the current source, which would have made it more cost effective to treat with a potential softer finished product.

The city located three potential sites for wells beginning with the current well field but at a deeper location.

This was the most economical location but the water that was found was very low quality and of very little volume.

The second site was in the north end, but was dismissed due to the small size of the lot, and the difficulty and cost of bringing the pipe to the water plant.

The third site was at Silver Lake Park, but the cost of piping it to the present well field is excessive and the source is in the same underground aquifer.

“At present the well capacities are sufficient to meet demand without finding another source,” said Guy.

Wayne Peal, Livingston Daily 8:43 a.m. EST November 2, 2015

A Flint-style crisis appears remote, but other issues remain in Livingston County.

(Photo: Photo illustration by Gillis Benedict)

Story Highlights

Largest water providers meet EPA standards

Most Livingston residents get water from own wells

Turn on the tap, pour a glass of water and take a drink.

It's something thousands of Livingston County residents do thousands of times each day.

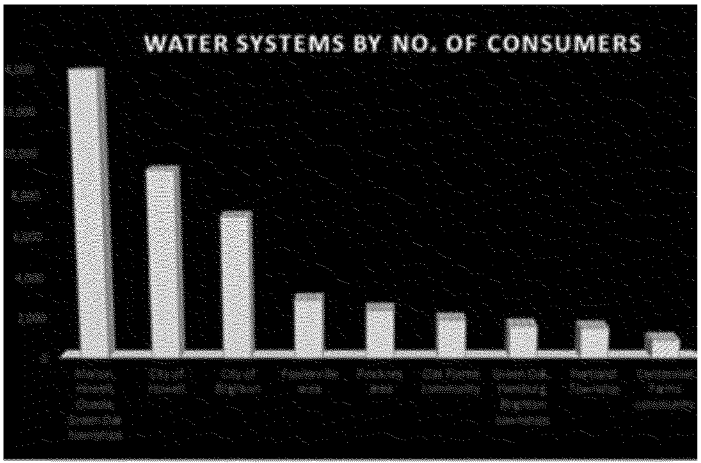
But is it safe?

That depends.

With the ongoing water safety crisis in Flint, less than 50 miles away, The Livingston Daily reviewed current water-quality reports for Livingston County's major municipal, private and multicommunity water systems.

The good news — all meet Environmental Protection Agency safety standards. That means chances for a widespread, Flint-like crisis are rare.

But major systems, those serving 1,000 or more customers, are less than half the local story. More than half of all county residents are on individual wells.



This chart shows the number of consumers per water system that serves 900 or more users.

Source: EPA

Source: EPA (Photo: Livingston Daily)

"I'd say it was at least 50 percent — it could be as high as 70 percent," county Environmental Health Director Matt Bolang said.

Those wells are subject to contamination from a variety of sources, including chemical and fertilizer runoff.

The county maintains records for each well and issues permits for new wells. Water treatment, though, is left up to the individual property owner.

Yet, the ongoing crisis in Flint shows that no one can take safe drinking water for granted.

Even though water from the county's largest providers is safe today, that fact doesn't mean county residents will never be at risk or that solutions will be quick in coming.

A lengthy battle to secure clean drinking water

Though it happened several decades ago, longtime customers of one local water authority recall their lengthy battle to secure clean drinking water.

“For about eight years, all we drank was bottled water.”

Kathy Carney, Fonda Island Briggs Lake Joint Water Authority chairwoman

Customers of the Fonda Island Briggs Lake Joint Water Authority, a private Brighton

Township-based system, wrangled for years with the state over water quality issues before the current system was created in 1983.

"For about eight years, all we drank was bottled water," current Chairwoman Kathy Carney recalled.

Still, the probability of a water crisis on a Flint-like scale appears remote.

Residents in Flint have been drinking water pulled from the Flint River with concerns being raised about lead content

"It 's not even like comparing apples and oranges — it's like apples and asparagus," said Howell City Manager Shea Charles whose city maintains the county's second-largest drinking-water system.

Flint's issues began last year when it switched — under a state-appointed administrator's recommendation — from the Detroit system to a source of its own, pulling drinking water from the Flint River.

The switch has been accompanied by concerns over increased lead content in city water, something that could cause health and mental issues, especially among the city's youngest residents.

"It looks like this was the state's fault," said state Sen. Joe Hune, R-Hamburg Township.

Hune last month began surveying Livingston County residents on suggested solutions, including whether the state should pay more than $9 million for Flint to return to the Detroit system.

That's something even fiscal hard-liner Hune is leaning toward.

"This is water, it's pretty basic," he said.

To take part in the survey, call 855-563-4863.

In terms of water sources, local systems are vastly different from either Flint's current system or the Detroit system. That is because Livingston County residents receive their water from underground wells.

Water at its source

"Our biggest source here is groundwater," Bolang said. "So, you don't get the kind of bacterial issues that you would get if you pulled from a lake or river."

Of course, Flint's issues involve more than just the quality of the water at its source.

Nationally recognized water-quality expert Marc Edwards told the Detroit Free Press that his own research showed untreated Flint River water caused the city's aging water pipes to corrode far more rapidly than the water being pumped in from Detroit.

That finding underscored concerns from residents and physicians about the high lead levels they had already suspected from the city's new water source.

Corrosion concerns have also surfaced locally.

"It's a constant issue for any system," Brighton utilities Director Tim Krugh said. But like other locals, Krugh said his system has taken steps to keep corrosion issues to a minimum.

System upgrades

Brighton's system, the county's third largest, dates from the 1930s. Historically, Howell's goes back all the way to the late 19th century.

In recent years, both cities have undertaken major upgrades.

Brighton conducted a system-wide overhaul in 2004, Krugh said. It also added three new wells from 1989-2001.

Over time, Brighton has also replaced "about 80 percent" of its original pipes, Krugh added.

Howell replaced the 50-year-old main line to its treatment facility in 2009.

TPlus, Howell also is continuing to upgrading its pipes under an ongoing program that also includes street repairs.

"What's called our street program is actually much more," Charles said. "We know we have some smaller pipes, but we've been getting after them."

The Marion, Howell, Oceola and Green Oak township water system — or MHOG — is the county's largest water supplier with more than 13,000 customers.

In all, EPA records reveal there are about 35 multiuser water systems currently serving Livingston County residents, including several with 100 customers or less. (That figure also doesn't include single-family wells.)

Latest reports for the 11 largest systems, all with 900 customers or more, showed each was in compliance with EPA water quality standards.

In addition to Howell, Brighton, Fonda Island Briggs Lake and MHOG, those systems also include Centennial Farms, Fowlerville, Hartland Township, the Livingston

Community Water Authority, Oak Pointe and Pinckney. Information for the private Hartland Meadows system wasn't immediately available.

Checking for contaminants

In addition to providing standards for inorganic contaminants such as lead and cooper, the EPA also sets acceptable maximum levels for a variety of other substances.

They include such inorganic contaminants as iron and arsenic, disinfectants like chlorine and radioactive contaminants like radium.

But those contaminants are not the only concern for local residents. New challenges to safe drinking water continue to emerge, both locally and nationally.

Their original battle long behind them, Fonda Island Briggs Lake residents are now concerned about fracking in their wellhead area.

In 2013, they sought a countywide resolution banning hydraulic fracking, a system involving injecting treated water into the earth to crack underground rocks, freeing oil and natural-gas deposits.

Fracking advocates say the process poses no danger.

"They say its safe — but it's our wellhead," Carney said.

At the same time, the U.S. Geological Survey has been tracking ground water levels at sites throughout the United States finding alarming drops in some areas, but not necessarily in Michigan.

A site tested in neighboring Washtenaw County showed that the water level had actually risen by about 1.5 feet from 2000-2012, a stark contract to levels in drought-stricken states like California.

Still, the fact that groundwater levels are decreasing anywhere in the United States shows water might not be a renewable resource in every case.

Plus,the ongoing crisis in Flint shows what can happen when we trifle with the water sources we do have.

How does your system rate?

Livingston County water system customers should receive annual water quality reports from their provider.

A number of systems, including all municipal systems, also post their results online.

Reports for Livingston County's multicommunity systems are also available on member townships' websites.

ADRIAN - Over the next month, Lenawee County Health Department officials will be visiting homes around Adrian that have been pinpointed as having high risk for lead poisoning.

According to the Lenawee County Health Department, Adrian is one of 14 communities in Michigan that is considered high risk for lead poisoning. Between 2014 and this year, 917 children in Adrian were tested for elevated blood lead levels and 55 tested positive, requiring quick action to remedy the situation.

“Because the city of Adrian is listed as one of the 14 high-risk communities a grant has been received by us to provide educational services to pregnant women and children five and under that live in homes built before 1978,” said Raquel Ybarra, Lenawee County Health Department’s lead specialist, during a childhood lead poisoning prevention program last week.

Ybarra and co-presenter Renee Price said many of the homes at risk in Adrian are along East Maumee Street. Ybarra said if a home was built before 1978 and has children ages 6 or younger or a pregnant woman living there then one should consider having it tested. She added that anyone can have lead poisoning, but it’s these two groups that are highly susceptible.

“Exposure to dust from lead-based paint is the most common way to get lead poisoning,” Ybarra said.

She also said exposure to lead can come from soil and water, and also some pottery, imported products and toys.

Deidre Reed, director of nursing for the Lenawee County Health Department, said the risk of water-related lead exposure in Adrian is not quite a main concern like the situation in Flint. She explained how Flint’s water treatment plant didn’t add the right chemicals to the drinking water pumped from the Flint River, which caused more corrosive water to leach lead from the city’s aging pipes and into household drinking water. She said that issue has not occurred in Adrian.

According to the city of Adrian utilities department, the city's drinking water met and surpassed every federal and state requirement when it was tested in 2014.

However, Reed said there might be homes in Adrian which may have lead water pipes, which could cause some issues. The best remedy for that would be replacement, she said.

Ybarra said too much lead in a child's body can cause issues such as behavioral problems, learning difficulties and growth delays. She said sometimes symptoms of lead poisoning may be mistaken for other conditions, such as autism.

For a pregnant woman, too much lead in the body can cause a miscarriage and harm the brain, kidneys and nervous system of fetuses.

The next step in to address lead poisoning issues in Adrian will bring county health officials into affected neighborhoods.

---

http://www.thetimesherald.com/story/news/local/2015/11/02/drinking-water-tests-come-back-safe-capac-marysville/74761110/

Syeda Ferguson, Times Herald 8:15 a.m. EST November 2, 2015

3 CONNECT 2 TWEETLINKEDINCOMMENTEMAILMORE

Independent results testing for lead in the drinking water at Capac Community Schools and Marysville Public Schools have come back safe.

Capac on Oct. 19 took water samples from its elementary, middle and high schools and from its central offices. Marysville also on Oct. 19 sampled the drinking water from 20 locations at its oldest facility, Washington Elementary School.

The two districts were among those across the state heeding a statewide call from the Michigan Department of Environmental Quality to consider testing the drinking water coming out of pipes within school buildings for lead levels, especially at older facilities. The urging came after unhealthy levels were discovered in Flint schools.

While municipal water authorities do monitor regularly water quality at various sites within their distribution systems, not all municipalities pull their samples from school buildings.

Brad Wurfel, MDEQ communications director, said the department continues to prioritize water samples sent in from school districts, and that it's not necessary for schools to test annually. He said districts with older facilities that have never tested should consider doing that at least once.

"What makes lead and copper different is it's not in the supply. It's in the fixtures," Wurfel said.

At Washington Elementary in Marysville, lead was detected in 13 of the 20 drinking water samples that were collected, according to a 23-page report from Troy-based Testing Engineers & Consultants, which handled the testing for Marysville.

However, none of the samples were in excess of the Environmental Protection Agency's maximum contaminant level for lead of 0.015 mg/L, the highest allowable contaminant level that is enforceable.

The highest reported lead level at Washington Elementary was found in a first draw sample taken from the building's kitchen vegetable sink, with a reported lead level of 0.014 mg/L. That amount was within the EPA's allowable limit.

Scott Chandler, manager of industrial hygiene services with Testing Engineers & Consultants, said the maximum contaminant level goal for lead is zero, but that can't be as readily enforced.

Capac collected samples using kits supplied by the St. Clair County Health Department and analyzed by the Michigan Department of Environmental Quality drinking water lab.

"Our drinking water tests for our buildings – elementary, middle, high, and central office – came back well within acceptable range. We do not have any lead concerns," Superintendent Stephen Bigelow said.

"Capac community water reports indicate high-quality drinking water, but we tested for lead because it is possible for lead to be present between the municipal supply and our buildings. The testing was done at the district's expense, and I expect to continue the process annually," Bigelow said in an email.

Wurfel said so far not many districts have taken up the initiative for independent testing.

"It's possible local schools are using other laboratory services, and we wouldn't know about them. What we're talking about here is non-regulatory sampling," he said.

Districts such as Algonac Community Schools are still considering whether to test.

"We are taking this very seriously," Superintendent John Strycker said. "I have met with administration, and we are in the process of developing a plan."

Dwayne Loper, water plant superintendent at St. Clair River Sewer and Water Authority, confirmed that testing is done regularly using samples pulled from Pine River Elementary and the administration building at East China School District. He said those two buildings are within their plant's water distribution system serving East China and China Township.

Kirk Grzelka, director of operations for East China School District, said water quality reports from the other municipalities that supply water to the district's other buildings are well within safe ranges.

“We're so far within the safe limits that it's not even close,” Grzelka said, adding that he could not be sure where the samples were taken.

Water authorities for the City of St. Clair and Marine City did not return phone calls.

Subject: RE: Flint Water question

Mr. Guyette,

Below are responses to your questions and can be attributed to U.S. EPA.

Q. Mr. Del Toral asserts that a city the size of Flint is required to use a corrosion control treatment such as phosphate in their drinking water. Is Mr. Del Toral correct?

Flint and other large drinking water systems are required to evaluate and optimize pipe corrosion control treatment to protect water from contaminants such as lead. When the city started sourcing drinking water from the Flint River in April 2014, the Michigan Department of Environmental Quality determined that Flint should follow the protocol for new systems -- which requires two new rounds of water sampling to determine whether corrosion control treatment is needed. The city has submitted sampling results for the six-month periods from July-December 2014, and from January-June 2015. MDEQ is currently analyzing the sampling data to determine whether corrosion control treatment is needed.

Q. Also, both Mr. Del Toral, and Marc Edwards, an expert on the issue at Virginia Tech, both say that the manner in which Flint conducts its tests is almost certain to minimize the risk and miss worst-case scenarios. What is the EPA's opinion regarding that?

Michigan complies with the Federal Safe Drinking Water Act's protocol which requires that the tap remain unused for at least 6 hours before taking a sample. EPA is currently revising the federal lead and copper rule to address several issues including sampling protocols.

In addition, EPA notes that the water samples taken from the Citizen name / Ex. 6 residence were atypical in two ways:

- the tap had not been run for over three weeks before the samples were taken. Stagnation can cause higher lead levels, and

- the home's long service line is configured in an unusual way.

Subject: RE: Lead levels and Chloramine

Hi All,

Here are a few excerpts from Flint's November 2014 OEL report (source = http://cityofflint.com/?p=6251):

"Stage 2 actions are to be implemented only if Stage 1 actions are ineffective in adequately reducing TTHM levels and therefore Stage 2 is
contingent upon the outcome of Stage 1."

"Stage 1 – Immediate Actions
☐ Hire ozone system manufacturer to troubleshoot ozone system
☐ Bench scale jar testing
o Match existing process and access possible areas of improvement
o Simulate potential modifications to treatment process
o Evaluate coagulation and flocculation polymer aid feeds to assist with TOC
removal
☐ WTP operational changes
o Discontinue softening bypass stream to reduce chlorine demand
o Disinfection of filter beds to reduce chlorine demand
o Possibly begin coagulation and flocculation polymer aid feeds to assist with
TOC removal depending on bench scale test results
☐ Increase water main flushing efforts to minimize stagnant water
☐ Water system modeling to identify areas with high water age and potential solutions
o Cedar Street Pump Station potential recirculation
o West Side Pump Station potential recirculation
o Storage tank volume use
o Possible broken closed valve locations
o Locations in need of flushing
o Lower high water levels in storage tanks"

"Stage 2 – Contingent Actions
☐ Fix ozone system
☐ Start feeding coagulation and flocculation polymer aids to lower TOC, if not
completed in Stage 1

☐ Convert to lime and soda ash softening
☐ Change disinfectant to chloramine or chlorine dioxide until KWA
☐ Install pre-oxidant feed at intake to optimize ozone disinfection
☐ Implement advanced treatment for THM precursor removal
☐ Increased main flushing based on water modeling results
☐ Continue valve replacements with water model assistance
☐ Emphasize cast iron pipes on water main replacement priority list"

I would think, based on the OEL, that everyone (State, public, etc.) should be aware that Flint is contemplating a switch to a different disinfectant, but only after they exhaust a slew of less drastic remedies for their DBP issues.

Hope that helps.

Thanks,
Andrea Porter

Subject: RE: Lead levels and Chloramine

Tom P and I met this morning to discuss various issues going on in MI, related to Flint. One topic that came up was the City's possible switchover to chloramines (this topic came up at a public meeting in Flint), and its possible effect on lead in the Flint drinking water, such as what happened in DC. We called Michael Wright to see if that recommendation came out of the Flint Technical Advisory committee. Mike had not heard that recommendation, but totally understood the overall ramifications on the system, that while the change over to chloramines would most likely decrease TTHMs, it also might detrimentally affect the lead levels at the tap. The State had not heard that Flint was contemplating this change over to chloramines, so Mike Prysby said he would check in with Flint.

Subject: RE: Lead levels and Chloramine

So, Andrea explained that the Pb-IV is the hard Pb lining that DC's pipes got from the years of over chlorinating. You said below that you don't think that Flint had any Pb-IV, so Flint will probably not have the lead issues that DC had. But, as you said, any significant changes in the water chemistry, can cause a wealth of problems.

Subject: Re: Lead levels and Chloramine

I seriously doubt that they have any Pb-IV in Flint, but anytime you make the significant and it seems iterative changes to the water chemistry, you are asking for trouble. I think we are going to need to think real hard about including mandatory OCCT studies and mandatory increased monitoring for at least some treatment changes.

Subject: Lead levels and Chloramine

Miguel—In light of the possibility of Flint going to chloramine use, Citizen name / Ex. 6 brought up a significant comparison to the DC lead fiasco. What will lead levels look like after the switchover to chloramines, since there are lead service lines in Flint? She cites from the CDC research study below. Specifically, this paragraph:

“Changes in water treatment and disinfection practices can substantially undermine lead corrosion control (60). In the mid-1990s in the District of Columbia (DC), high levels of free chlorine were used to decrease coliform bacteria in water, a process that inadvertently changed the type of lead mineral coating in the water lines to one with very low solubility in the background pH of the DC drinking water. When the free chlorine was replaced with chloramines, the transformed highly insoluble lead scale minerals were no longer stable and dissolved. Therefore, a substantial level of lead was released from the lead service lines into drinking water at the tap (61). CDC reviewed the relationship between BLLs in children, the presence of a lead service line, and water disinfection practices in DC during 1998–2006 (62). The study reported that the presence of a lead service line was associated with higher BLLs in children. This relationship was most pronounced during 2001 through June 2004, when chloramines were used to disinfect the drinking water without adequate corrosion control (62). An observational study in which the BLLs of children were matched to population-based data of water lead levels during periods when water disinfection practices changed in DC concluded that the increase in water lead levels was associated with an increase in the BLLs of children (63). In a study in Wayne County, North Carolina, a unified geographic information system was used to link BLLs with water service lines made with or without lead. The use of chloramines in water predicted higher water lead levels and BLLs, controlling for well-established, known predictors of BLL (44).”

LCR And Control Measures Sections, 4th paragraph down. This is my concern with the new chemicals the city wants approval for. What happens to the other citizens who do not know they have an elevated lead content or for the ones who have already tested with elevated levels? I know one of the other levels was 37, that was the highest the city had seen before my levels, what will it look like when Chloramine is added?
Thank you

CITY OF FLINT
Operational Evaluation Report
November 26, 2014

EXECUTIVE SUMMARY

Environmental Protection Agency (EPA) and Michigan Department of Environmental Quality (MDEQ) regulations require that public water suppliers test drinking water quarterly throughout the distribution system for disinfectant by-products (DBP's). Two categories of DBP's, tri-halomethanes (THM) and halo-acetic acids (HAA5), are regulated and must be tested for. The City of Flint began operation of their water treatment plant (WTP) full time with the Flint River as the source on April 25, 2014. Since that time, two quarters of samples taken indicate that future violations are inevitable for total THM without some modifications to the water system. In response, the City hired Lockwood, Andrews & Newnam, Inc. (LAN) to complete this Operational Evaluation Report (OER) in conformance with EPA guidelines with the goal to determine the cause(s) of high levels of THM and evaluate possible solutions.

The EPA promulgated the Stage 2 Disinfectants and Disinfection By-Products Rule (DBPR) in January 2006 which set maximum contaminant levels (MCLs) for total trihalomethanes (TTHM) and HAA5 based on an annual running average, tested quarterly, for a given sampling location. The City of Flint reports levels from 8 sampling test locations. Of the two quarterly sampling cycles since Flint began operating the WTP full time, HAA5 levels have been acceptable but TTHM levels have been high at all 8 sampling sites.

According to the Stage 2 DBPR, the annual average value requires 3 quarters of sampling data with the most current period counting twice. Therefore, the City of Flint has not yet experienced a violation of the TTHM MCL because only 2 quarters of data have been obtained. However, levels recorded indicate the likelihood of an MCL exceedance later this year.

A number of issues have been identified as possibly contributing to the high THM levels measured.

1. Inefficient ozone system operation which has resulted in increased chlorine feed.
2. Sewer leak discovered upstream of intake causing high total Coliform levels, increased chlorine demand, and resulting need to increase chlorine feed.
3. Bypass stream around softening contributed to chlorine demand.
4. Unlined cast iron pipe in the distribution system contributing to chlorine demand.
5. Recirculating water in the distribution system due to less than ideal configuration of Cedar Street and West Side pump stations.
6. Broken valves resulting in stagnant water in some areas.
7. High chlorine demand in filters.
8. High THM formation potential (THMFP) in source water.
9. Less than optimal removal of THM precursors

DRAFT

ACTION PLAN

The City of Flint has signed an agreement with the Karegnondi Water Authority (KWA) to purchase raw water drawn from Lake Huron. The KWA system is currently under construction and expected to be operational by late 2016. The water supply from Lake Huron will have entirely different water quality characteristics from the Flint River and those characteristics are expected to yield drastically reduced DPB formation. With that, non-structural options to help reduce THM levels are much preferred over solutions requiring new construction. Therefore, two categories of actions have been devised: Stage 1 being actions that can be completed relatively quickly without major construction and Stage 2 consisting of either long term actions or solutions requiring major construction. The City has completed or intends to complete Stage 1 Actions by February 16, 2015, the week in which the next quarterly sampling is to be done. Stage 2 actions are to be implemented only if Stage 1 actions are ineffective in adequately reducing TTHM levels and therefore Stage 2 is contingent upon the outcome of Stage 1.

Stage 1 – Immediate Actions

- ☐ Hire ozone system manufacturer to troubleshoot ozone system
- ☐ Bench scale jar testing
  - Match existing process and access possible areas of improvement
  - Simulate potential modifications to treatment process
  - Evaluate coagulation and flocculation polymer aid feeds to assist with TOC removal
- ☐ WTP operational changes
  - Discontinue softening bypass stream to reduce chlorine demand
  - Disinfection of filter beds to reduce chlorine demand
  - Possibly begin coagulation and flocculation polymer aid feeds to assist with TOC removal depending on bench scale test results
- ☐ Increase water main flushing efforts to minimize stagnant water
- ☐ Water system modeling to identify areas with high water age and potential solutions
  - Cedar Street Pump Station potential recirculation
  - West Side Pump Station potential recirculation
  - Storage tank volume use
  - Possible broken closed valve locations
  - Locations in need of flushing
  - Lower high water levels in storage tanks

Stage 2 – Contingent Actions

- ☐ Fix ozone system
- ☐ Start feeding coagulation and flocculation polymer aids to lower TOC, if not completed in Stage 1
- ☐ Convert to lime and soda ash softening
- ☐ Change disinfectant to chloramine or chlorine dioxide until KWA
- ☐ Install pre-oxidant feed at intake to optimize ozone disinfection
- ☐ Implement advanced treatment for THM precursor removal
- ☐ Increased main flushing based on water modeling results
- ☐ Continue valve replacements with water model assistance
- ☐ Emphasize cast iron pipes on water main replacement priority list

DRAFT

DRAFT

I. BACKGROUND

The City of Detroit Water and Sewer Department (DWSD) has historically provided drinking water for the City of Flint and Genesee County. In the late 1990's growing concern regarding the reliability of the DWSD supply prompted the City of Flint to upgrade their existing water treatment plant (WTP). Those improvements, defined as Phase I, were completed in 2005 and were intended to allow the Flint WTP to operate, using the Flint River as the source, for an extended period of time in the event that supply from the DWSD was temporarily interrupted. Additionally, the Phase I improvements set the stage for Flint to break free from dependence on the DWSD supply and water charges over which they had no control.

A. WATER SUPPLY TRANSITION

1. Detroit Water and Sewer Department (DWSD)

Until recently the Genesee County and Flint region had been provided drinking water by the DWSD. However, due to excessive cost increases and reliability issues with the DWSD system other options had to be explored.

2. Karegnondi Water Authority (KWA)

In 2010 the Karegnondi Water Authority (KWA) was formed for the purpose of developing a new water supply from Lake Huron to serve the region in lieu of the DWSD supply and the City of Flint elected to join. The KWA expects the new system which is currently being constructed to become operational in the fall of 2016.

3. Flint River – Interim Period

With a water supply agreement between Flint and the DWSD set to expire in early 2014 and the KWA system not expected to be operational until late 2016, the City of Flint decided to initiate operation of the existing WTP full time utilizing the Flint River as the interim water source. A variety of WTP improvements were necessary for the Flint plant to become a full-time plant. For purposes of this report, Phase II improvements to the Flint WTP are improvements which have been made to allow the plant to operate full time with either the Flint River as the source or the KWA supply as the source.

B. TTHM PENDING VIOLATIONS

The calculation for determining if the MCL has been violated for TTHM is:

(2 x current quarter value + previous 2 quarter values) / 4

Flint has completed tests for 2 quarters and therefore has not violated an MCL limit to date. However, the third quarter of sample data is likely to provide MCL exceedances at all 8 sampling sites. Test results are tabulated below.

DRAFT

TABLE 1 – 2014 DBP TEST RESULTS

Sample Location	TTHM 1st Qrt 5/21/14	TTHM 2nd Qrt 8/21/14	TTHM 3rd Qrt	HAA5 1st Qrt 5/21/14	HAA5 2nd Qrt 8/21/14	HAA5 3rd Qrt

2501 Flushing – Univ. Market	75.1	196.2		38	17	
3216 MLK – Salem Housing	82.2	112.4		41	25	
5018 Clio – Rite Aid	88.2	144.4		49	30	
6204 N. Saginaw – N. Flint Auto	79.2	118.3		50	37	

TTHM MCL = 80 ug/l
HAA5 MCL = 60 ug/l

C. WATER TREATMENT PLANT RECENT IMPROVEMENTS & STATUS

1. Phase I WTP Improvements

Since 1965, the Flint WTP has remained a secondary or backup supply system to the DWSD primary supply. Typically the secondary supply for a public water system is expected to be needed only during emergency situations and normally is designed for short term operation such as providing the average daily demand for a few days. Conversely, Phase I improvements were designed with the intent to upgrade the Flint WTP in order to allow for an extended short term period (6 weeks) because of the perceived high risk that the DWSD supply would fail and remain out of service for an extended duration. Regardless, the Flint WTP was still intended to serve as a standby plant and as such the Phase I improvements lacked redundancies that would be required for a primary supply WTP.

2. Past Pilot Study Testing

During design of the Phase I improvements a treatability study was completed by Alvord, Burdick & Howson, LLC (AB&H) in 2002. The Treatability Study evaluated the current treatment processes that are in place at the Flint WTP today with the Flint River as the source. The report recommended the following:

TABLE 2 – 2002 WTP TREATMENT RECOMMENDATIONS

Treatment	Purpose	Point of Application	Dosage (mg/l)
Sodium permanganate	Zebra mussel control	Intake	0.3
Ozone	Taste & odor removal, disinfection	Diffusor basin	1.5
Ferric chloride	Coagulation	Rapid mix	40
Coag aid polymer	Turbidity & TOC removal	Rapid mix	2.0
Floc aid polymer	Turbidity & TOC removal	Floc basin	0.05
Lime	Softening	Softening basin	175
Soda ash	Softening	Softening basin	52
Carbon dioxide	pH adjustment	Recarb basin	37
Media filters	Filtration	Na	Na
Chlorine	Disinfection	Filter effluent	1.0

Of the recommended items, zebra mussel control, coagulant and flocculation polymer aids, and soda ash feed have not been incorporated into the treatment process.

3. Phase II WTP Improvements for Full Time Operation

Phase II WTP improvements are those needed to convert the Flint WTP from a back-up supply to a primary supply plant. A number of improvements have already been constructed as they were necessary to operate full time, treating water from the Flint River. The improvements under the title of Phase II that have been completed or are nearly complete include upgrades to the lime sludge lagoon, the lime sludge lagoon decant and disposal system, decant pump station and force main, installation of mid-point chlorination before filtration, and upgrade of the electric feed sub-station.

Additional improvements to the Flint WTP that are to be completed to become part of the normal treatment process using water supplied by the KWA are:

- ☐ New oxygen and nitrogen storage facilities for the ozone system
- ☐ New coagulant feed system
- ☐ Electrical
    - Pump Station #4 upgrades
    - Plant 2 improvements
    - Filter press building feeder
    - SCADA and controls upgrades
    - Filter transfer pump station feeders
- ☐ Installation of the future raw water feed connection point for the KWA
- ☐ Pump replacements and VFD installation in the low and high service pump station
- ☐ Filter transfer pump station to Dort Reservoir
- ☐ Facility security improvements

DRAFT

II. SOURCE WATER EVALUATION

A. DATA ANALYSIS

Based on past data collected and the 2002 Treatability Study by AB&H, the Flint River water quality varies seasonally with higher hardness and alkalinity experienced in the winter. Higher magnesium concentrations are also experienced in the winter, adding difficulty to the settling process due to neutrally buoyant floc. General water quality average characteristics recorded for the 2002 Treatability Study as compared with average characteristics recorded this year are shown in Table 3 below.

TABLE 3 – FLINT RIVER WATER QUALITY CHARACTERISTICS

Period	Turbidity NTU	TOC Mg/l	Alkalinity Mg/l	Hardness Mg/l as CaCO3	pH	Total Col. Count/day
2001 Apr–Oct	7.9	9.4	215	27[illegible]	8.1	870-1230 (7300 max)
2014 May–Oct	8.3	10.3 5/22/14	207	252	8.2	1900-9000 (48,300 max)

DRAFT

Other than total Coliform, the Flint River characteristics do not appear to have changed significantly over the past 10+ years. Note that further investigation by City staff revealed a sewer leak upstream of the plant that likely was contributing to the total Coliform count.

B. CONCLUSIONS

Considering the minor changes in Flint River water quality, much of the information contained in the 2002 Treatability Study by AB&H remains relevant today. Data from that report assumed to be consistent today include the following:

- ☐ Flint River is influenced by groundwater from a dolomitic aquifer
- ☐ Hardness varies seasonally with higher hardness and alkalinity in the winter
- ☐ Hardness, alkalinity, magnesium concentrations tend to be reduced by run-off
- ☐ Total THMFP is likely [illegible]80-440 micrograms per liter as measured between April 2001 and January 2002. The City intends to re-test the raw water to confirm the THMFP has not changed. Results are pending.

In development of the 2002 Treatability Study, processes were simulated which resulted in low THMFP. Therefore, information contained in that report will be used to assist with establishing a baseline jar testing procedure discussed further in Section III.

DRAFT

III. TREATMENT PROCESS EVALUATION

A. EXISTING PROCESS DESCRIPTION

The existing WTP consists of an intake with screening from the Flint River, low lift pumping, ozonation, rapid mix, flocculation, settling, softening, recarbonation, filtration, storage and high service pumping. A process diagram is shown as Figure 1.

1. Intake

A 72" diameter pipe draws water from the Flint River through 2 traveling screens to the low lift pump structure. No chemicals are currently fed for Zebra mussel control or pre-oxidation as recommended by the 2002 Treatability Study. Manual removal of zebra mussels proved to be more economical than installation of chemical feed equipment considering the short term need.

2. Ozone

There are 2 ozone generators designed to provide adequate ozone for a WTP flow of up to 36 mgd. There are 3 ozone contact basins. The ozone generators were designed to produce 900 lbs/day at 10% concentration and up to 1300 lbs/day at 6% concentration each. Recent readings have indicated a production rate of approximately 700 lbs/day at 4% concentration. While serving the purposes of taste and odor control and disinfection, it is possible the current ozone feed might not be optimized to realize additional TOC removal benefits demonstrated by previous tests. Also, less than optimal ozonation has led to increased chlorine feed.

3. Rapid Mix

East and West rapid mix chambers allow chemical feed prior to the flocculation basins. Each rapid mix chamber is equipped with a 5 hp mixer.

4. Coagulation / Flocculation

The WTP contains two equally sized flocculation basins, east and west, and each basin provides tapered or gradually slowed mixing from inlet to outlet. There are fifteen 2 hp mixers in each basin with VFDs to control mixing speed. The 2002 Treatability Study recommended feeding both coagulation and flocculation polymer aids. Neither polymer aid is being used today because turbidity and TOC removals have been sufficient to meet regulatory requirements.

5. Settling

Primary clarification takes place within 3 basins containing plate settlers. The settlers are operating as designed.

6. Softening

Again, there are two basins for softening: east and west. Each basin is 120' in diameter and contains a solids contact softening unit. Each softening basin/unit has a design capacity of 18 mgd. Low lift pumping limitations, flow control to the basins, and fluctuating demands have made it difficult for WTP staff to stabilize the softening process. Softening is accomplished by feeding lime. The decision was made by the City not to feed soda ash in order to remove non-carbonate hardness because acceptable hardness levels could be achieved with lime feed only and softening is short term until Lake Huron water becomes available.

DRAFT

7. Recarbonation

Recarbonation for pH adjustment is accomplished in east and west recarbonation basins between and to the north of the softening basins. Carbon dioxide storage and feed equipment is located west of the recarbonation basins.

8. Filtration

Filtration is accomplished with 12 dual media filters, equally sized and designed to filter 3.0 mgd each. Media consists of 12" of sand and 18" of anthracite. The filters have been operated intermittently over the years due to the standby nature of the WTP and until recently, chlorine injection took place downstream of the filters. It is possible some microbial growth has developed in the filters.

9. Disinfection

Limited disinfection is provided by ozonation, but the primary form of disinfection is chlorine fed prior to filtration and prior to finish water storage / high service pumping. The intermediate chlorine injection location was recently constructed under the Phase II, Segment 1 contract.

10. Clear Well & Pumping

The pump building sits adjacent to a 3 MG clear well and contains both low and high service pumps.

B. JAR TESTS / EXPERIMENTS

1. Approach

There are several well practiced methods by which DBPs can be reduced. First, the disinfectant can be changed to an alternate that has a lower tendency to form DBPs. Second, additional treatment systems such as activated carbon or air stripping (depending on the nature of the precursors) can be added to remove DBP precursors. Lastly, the existing treatment processes can be optimized to remove as much DBP precursor as possible. Of these options, optimizing existing treatment processes is the only strategy that does not require the construction of new and expensive facilities. It is anticipated that Flint will be receiving Lake Huron water in approximately two years and this water will have a completely different chemistry from the Flint River. Major process changes instituted to address THM levels using Flint River water are likely to be unnecessary for Lake Huron water and may even be inappropriate. Therefore, those options which require addition of new treatment processes are undesirable at this time. In recognition of this upcoming change in water source, this study will concentrate on improving the existing processes, rather than adding new ones. New treatment processes will only be recommended if operational changes to the existing treatment train prove ineffective.

Recent sample test results suggest that most of the DBPs are formed in the distribution system rather than within the treatment plant. Therefore, the most logical approach is to reduce the DBP formation potential (DBPFP) rather than simply lowering the levels of DBPs leaving the plant. During bench scale testing, formation potential (FP) levels will be the primary indicator of success or failure of any proposed process modifications.

2. Protocol

Bench scale pilot testing is intended to reflect actual plant operating and hydraulic conditions so the bench scale treatment units will be sized based on various dimensionless factors to ensure the pilot treatment matches the actual system. Bench scale ozonation is not practical due to time and cost limitations. Therefore, water samples will be withdrawn following the plant ozone basin. These samples will be transported to the laboratory where they will be dispensed into square testing jars. The jars will act as rapid mix, three-stage flocculation, and settling. Rapid mix and flocculation conditions will be matched to the plant based on "Gt" values. The "G" value is a measure of the mixing intensity and is a function of mix time, viscosity of the liquid, and mixing power applied to the water. "Gt" then, is a size scaling factor where time has been accounted for. Settling time will be scaled to match the shorter settling depth of the testing jars. After settling, samples will be decanted from the test jars. The decanted samples will then be lime softened; softening conditions will be similarly matched on the basis of "Gt". Fluoride will be added and carbon dioxide sparged into the samples to reduce the pH. The water will then be vacuum filtered through filter paper, sized to simulate the plant's dual media filters. The samples will be dosed with excess chlorine and allowed to react for seven days before testing for DBPs to determine the formation potential.

Although these conditions may be refined based on new information, we anticipate the following:

TABLE 4 – BENCH SCALE TEST MIXING INTENSITIES

Process	G	Duration
Ozonation	Plant	-
Rapid Mix	[illegible]	25 sec
Flocculation, Stage 1	50	9 min
Flocculation, Stage 1	25	9 min
Flocculation, Stage 1	12	9 min
Settling	[illegible]	10 min
Softening	TBD	10 min
Recarbonation	na	na

It is expected that the primary variables during the testing will be chemical additions and chemical dosages. Specific chemicals and dosages used for initial testing conditions will be selected to reflect current plant usage and the recommendations of the 2002 Treatability Study.

TABLE 5 – BENCH SCALE TEST CHEMICAL FEED RATES

Chemical	Current Usage	2002 Study
Ozonation	4.66 mg/l	1.5 mg/l
Ferric Chloride	7.7 mg/l	40 mg/l
Coagulant Aid Polymer	Not used	2.0 mg/l
Flocculation Aid Polymer	Not used	0.05 mg/l
Lime	120 mg/l	175 mg/l
Soda Ash	Not used	52 mg/l
Cationic Softening Polymer	3.13 mg/l	Not used
Anionic Softening Polymer	0.88 mg/l	Not used
Fluoride	0.45 mg/l	1 mg/l
Carbon Dioxide	32 mg/l	37 mg/l
Chlorine	6.3 mg/l	1 mg/l

DRAFT

3. Considerations

The 2002 Treatability Study did not note significant formation of DBPs. This may be a function of different Flint River water chemistry at that time. However, recognizing the considerable differences in chemical usage and dosages between that study and current operations, those differences in chemical use and dosage are an obvious starting point for optimizing treatment to prevent DBP limit exceedance.

Although it is believed that optimization of current treatment can correct the DBP issue, should optimization of present treatment prove insufficient, alternate residual disinfectants (chloramines and chlorine dioxide) will be investigated as additional treatment measures.

4. Results

To be completed following jar testing and experimentation.

5. Conclusions

To be completed following jar testing and experimentation.

DRAFT

DRAFT

IV. DISTRIBUTION SYSTEM EVALUATION

EPA guidance for the distribution evaluation portion of an OER is focused on identification and isolation of a specific portion of the distribution system that led to the exceedance. The circumstances of Flint's apparent pending TTHM exeedances are unusual in that a new supply has been implemented which clearly corresponds to the high TTHM sample results. Despite obvious implications to the primary cause of increased TTHM levels, value remains in evaluating the distribution system as there may still be distribution improvements that can be made to help alleviate the problem.

Evaluation of the distribution system, including modeling, was recently added to LAN's scope of services. When finished, information will be provided to complete the following topics in this section.

A. INFRASTRUCTURE

1. Piping

Main break history information available?
List pipe data for system… age, material, size

2. Storage

Considering drop off in demands in recent years, are storage tanks oversized?
Do they have mixing, baffling, other, to prevent stagnant water?
Are tanks in good condition?

3. Pump Stations

Condition of pump stations?
Pumps oversized?
Are valves working properly to maintain pressure zones?

B. OPERATIONS AND MAINTENANCE

1. Pump Station & Storage Operations

Are pressure districts set up properly?
Cedar Street Pump Station – no established pressure zone? Talk to Flint
West Side Pump Station – no established pressure zone? Talk to Flint
High and low levels in tanks optimally set? Should they be adjusted to use less storage volume?

2. Booster Disinfection Practices

They don't have any, do they?

3. Changes in System Demands

Long term decline in demands
Short term fluctuations – max day in winter due to large number of main breaks

C. WATER SYSTEM HYDRAULIC MODELING

1. Simulation of Existing System

Match existing conditions, particularly chlorine residual. We have chlorine feed data at plant and residuals at 10 locations in each MOR, May-October.

2. Identification of Deficiencies

Specific issues to look at:

Worst case at minimum daily demands
Water age in entire system
Recirculating water through pump stations
Use of storage tanks
Indications of broken valves

DRAFT

V. RECOMMENDATIONS TO MINIMIZE FUTURE OEL EXCEEDANCES

A. SOURCE

The City of Flint has already committed to the change from the Flint River as the water source to Lake Huron under the KWA system, planned for late 2016. The risk of future TTHM limit violations will decline substantially with the use of water from Lake Huron due to much lower DBP precursors. It is important to recognize that the Flint River will become strictly an emergency supply when the KWA supply becomes available and any investments toward the Flint River should be contemplated accordingly. Recommendations discussed below in this section apply to the Flint River as the source.

Reverting to supply from the DWSD until the KWA supply is available as an option. However, the DWSD has stipulated that a $4 million connection fee would apply and current water rates would include approximately $900,000 / month flat fee plus usage charges. Therefore, utilizing the DWSD for interim supply is cost prohibitive under the terms defined by the DWSD.

DRAFT

1. Watershed Management

A volunteer group entitled the Watershed Coalition performs various tasks related to managing the Flint River watershed such as spring cleanups and annual benthic studies to evaluate the river 'health'. No additional action is recommended at this time.

2. Monitoring

The City documents typical raw water characteristics as part of standard preparation of Monthly Operating Reports (MOR). No changes are recommended at this time.

3. Intake Operations

The 2002 Treatability Study recommended pre-oxidation in the form of sodium permanganate as a feed at the intake. However, pre-oxidation with sodium permanganate is unlikely to provide significant oxidizing of organics beyond that provided by ozonation. It is possible the addition of hydrogen peroxide would enhance the ozone process.

4. Seasonal Strategies

Past data indicates the Flint River is influenced by groundwater and in particular, dolomitic spring water. The result is hard water with high concentrations of magnesium and sulfate. Also, hardness and alkalinity are higher during the winter. Upon initiation of supply from the Flint River, the City made the decision to soften with lime only to focus on removal of carbonate hardness. One potential modification that could assist with TOC removal and thus decrease THMFP would be lime and soda ash softening. If implemented soon, the procedural change would be timely as it would also address increased hardness expected going into this winter.

5. Upstream Contamination Issues

Upstream contamination issues are extremely difficult to prevent and even if detected are difficult to locate. Evaluation of raw water data collected for MORs is the easiest manner in which to detect upstream contamination issues because the data is already collected for treatment purposes. In fact, high total Coliform readings signaled a potential issue recently that the City found to be a sewer leak, which was subsequently repaired.

An upstream monitoring and warning system could be established to attempt to detect spill event type contamination early enough to cease intake prior to the contamination reaching the WTP. However, given the imminent conversion to the KWA supply, the period of full time use would likely be far too short to achieve payback on the capital expenditures.

B. TREATMENT PROCESS

1. Operational Recommendations

- ☐ Coagulation and flocculation polymer aids: The 2002 Treatability Study suggested the use of coagulation and flocculation polymer aids. These polymer aids were shown in the 2002 Treatability Study to increase TOC removal and thereby reduce THMFP. Further evaluation will be completed during jar testing. [what would need to be done to the system to allow feed?? Could it be done easily??]
- ☐ Discontinue softening bypass: The City was previously bypassing a portion of flow around the softening basins because hardness levels did not warrant softening of the full stream. However, this practice was discontinued because it was believed the bypass stream was contributing to chlorine demand and preliminary data has supported the belief. Chlorine demand dropped 0.5 – 1.0 mg/l following elimination of the bypass stream in early November 2014.
- ☐ Soften with line and soda ash: Research has shown that enhanced softening with both lime and soda ash may provide additional TOC removal. The efficacy of this option will be evaluated during jar testing.
- ☐ Disinfection of filter beds: In case there has been microbial growth it is recommended the filters be 'shock' treated with chlorine and rinsed. A chlorine injection point was added upstream of the filters during the first segment of Phase II so future growth in the filters should not be an issue.
- ☐ Optimization of all existing treatment processes: Depending on bench scale testing conditions and results, slight modifications to all treatment processes might in order to replicate lower DPBFP.

2. Infrastructure Change Recommendations

- ☐ Fix and/or replace faulty ozone equipment: Since the ozone equipment was installed it has not been used extensively so the hope is that major components remain in good condition and the system can be easily modified to restore proper functionality. The City has scheduled the equipment manufacturer to field inspect the system on December 15, 2014.
- ☐ Change disinfectant to chloramine or chlorine dioxide: If other options prove to be ineffective, conversion to another disinfectant should be fully evaluated. Various characteristics of chloramination indicate an advantage over chlorine dioxide, but a full analysis would provide clarity as to which would be preferred.
- ☐ Install pre-oxidant chemical feed: Hydrogen peroxide as a pre-oxidant can enhance the activity of the ozone. This option is listed as a consideration only if problems continue with ozonation.
- ☐ Repair upstream sewer leak: a sewer leak upstream of the WTP intake was discovered and has already been repaired by the City.

DRAFT

C. DISTRIBUTION SYSTEM

Recommendations will be incorporated into this report when available. It is anticipated details will be provided for the following topics.

1. **Manage Water Age**
   a) **Storage Tanks**
   b) **Residence Time in Pipes**

2. **Reduce Disinfectant Demand**
   a) **Flushing**
   b) **Cast Iron Pipes**

3. **Water Modeling of Recommendations**
   Determine best flushing locations to reduce water age
   Changes to storage tank operating levels to reduce water age
   Valves to close/add to improve pressure zones, reduce recirculation
   Optimization of pump station use – smaller pumps? Shut down?

A number of actions have already been taken in terms of the distribution system. Water main flushing efforts were increased until late November when freezing weather became prevalent. Also, numerous valves that were broken in the closed position and believed to have been contributing to stagnant water were repaired.

D. BOOSTER DISINFECTION

Decreasing chlorine feed at the WTP and adding booster disinfection in the distribution system is an alternative intended to reduce the reaction time at higher concentrations of chlorine to reduce DPB formation. Extensive looping and branching within the existing system would require numerous booster feed points and water system modeling to determine the most effective feed point locations. As a result, booster disinfection would likely not be cost effective. Further discussion and details will be provided when the distribution evaluation results are available.

E. CATEGORIZATION OF ACTIONS

Considering that the Flint River is being used as the water source only until the KWA supply is available (expected late 2016), options to address high THM formation that require new construction or extensive time to implement are not preferred. On the other hand, the City understands THM sample results to date dictate that some action is necessary. Two categories have been developed to assist the City in prioritizing actions to take. Stage 1 consists of actions that can be completed relatively quickly without major construction and Stage 2 actions are either long term actions or solutions requiring major construction. Stage 1 actions are to be completed first followed by evaluation of the results prior to consideration of Stage 2 actions. Grouping of actions are shown in the table below.

DRAFT

TABLE 6 – ACTION PLAN

	Action	Purpose
Stage 1	Troubleshoot ozone feed system	Reduce chlorine feed and increase TOC removal
	Bench scale jar testing	Optimize treatment process and evaluate possible modifications
	Discontinue softening bypass	Reduce chlorine demand
	Disinfect filters	Reduce chlorine demand
	Increased water main flushing	Reduce water age / stagnant water
	Water system modeling evaluation	Determine areas with high water age and reasons
	Implement coag. & floc. polymer aids	Increase TOC removal
	Lower high water level in storage tanks	Decrease water age
Stage 2	Repair ozone system	Reduce chlorine feed and increase TOC removal
	Continue increased water main flushing	Reduce water age / stagnant water
	Convert to lime and soda ash softening	Increase TOC removal
	Continue valve replacements based on water model	Reduce water age / stagnant water
	Change disinfectant to chlorine dioxide	Reduce THMs
	Install pre-oxidant feed at intake	Optimize ozone disinfection, reduce chlorine
	Place priority on replacing cast iron water mains	Reduce chlorine demand

Samples were taken the week of November 1[illegible]th for the 3rd quarter of testing. Although the City has begun implementation of Stage 1 actions, THM results are not expected to be noticeably affected since there has not been enough time for a response. The next quarter of sampling is due to be completed the third week in February. It is the City's intent to implement Stage 1 actions prior to the [illegible] quarter of THM sampling. [need to make sure Flint is good with this]

Subject: RE: Lead levels and Chloramine

Hi All,

Here are a few excerpts from Flint's November 2014 OEL report (source = http://cityofflint.com/?p=6251):

"Stage 2 actions are to be implemented only if Stage 1 actions are ineffective in adequately reducing TTHM levels and therefore Stage 2 is
contingent upon the outcome of Stage 1."

"Stage 1 – Immediate Actions
☐ Hire ozone system manufacturer to troubleshoot ozone system
☐ Bench scale jar testing
o Match existing process and access possible areas of improvement
o Simulate potential modifications to treatment process
o Evaluate coagulation and flocculation polymer aid feeds to assist with TOC
removal
☐ WTP operational changes
o Discontinue softening bypass stream to reduce chlorine demand
o Disinfection of filter beds to reduce chlorine demand
o Possibly begin coagulation and flocculation polymer aid feeds to assist with
TOC removal depending on bench scale test results
☐ Increase water main flushing efforts to minimize stagnant water
☐ Water system modeling to identify areas with high water age and potential solutions
o Cedar Street Pump Station potential recirculation
o West Side Pump Station potential recirculation
o Storage tank volume use
o Possible broken closed valve locations
o Locations in need of flushing
o Lower high water levels in storage tanks"

"Stage 2 – Contingent Actions
☐ Fix ozone system
☐ Start feeding coagulation and flocculation polymer aids to lower TOC, if not
completed in Stage 1

☐ Convert to lime and soda ash softening
☐ Change disinfectant to chloramine or chlorine dioxide until KWA
☐ Install pre-oxidant feed at intake to optimize ozone disinfection
☐ Implement advanced treatment for THM precursor removal
☐ Increased main flushing based on water modeling results
☐ Continue valve replacements with water model assistance
☐ Emphasize cast iron pipes on water main replacement priority list"

I would think, based on the OEL, that everyone (State, public, etc.) should be aware that Flint is contemplating a switch to a different disinfectant, but only after they exhaust a slew of less drastic remedies for their DBP issues.

Hope that helps.

Thanks,
Andrea Porter

Subject: RE: Lead levels and Chloramine

Tom P and I met this morning to discuss various issues going on in MI, related to Flint. One topic that came up was the City's possible switchover to chloramines (this topic came up at a public meeting in Flint), and its possible effect on lead in the Flint drinking water, such as what happened in DC. We called Michael Wright to see if that recommendation came out of the Flint Technical Advisory committee. Mike had not heard that recommendation, but totally understood the overall ramifications on the system, that while the change over to chloramines would most likely decrease TTHMs, it also might detrimentally affect the lead levels at the tap. The State had not heard that Flint was contemplating this change over to chloramines, so Mike Prysby said he would check in with Flint.

Thank you, Miguel. This entire discussion is bringing this to the forefront of the disaster, as you say. I think we should discuss getting a group of experts together with Liane, too, at our April 28 lunch meeting.

Subject: RE: Lead levels and Chloramine

So, Andrea explained that the Pb-IV is the hard Pb lining that DC's pipes got from the years of over chlorinating. You said below that you don't think that Flint had any Pb-IV, so Flint will probably not have the lead issues that DC had. But, as you said, any significant changes in the water chemistry, can cause a wealth of problems.

Subject: Re: Lead levels and Chloramine

I seriously doubt that they have any Pb-IV in Flint, but anytime you make the significant and it seems iterative changes to the water chemistry, you are asking for trouble. I think we are going to need to think real hard about including mandatory OCCT studies and mandatory increased monitoring for at least some treatment changes.

Subject: Lead levels and Chloramine

Miguel—In light of the possibility of Flint going to chloramine use, Citizen name / Ex. 6 brought up a significant comparison to the DC lead fiasco. What will lead levels look like after the switchover to chloramines, since there are lead service lines in Flint? She cites from the CDC research study below. Specifically, this paragraph:

“Changes in water treatment and disinfection practices can substantially undermine lead corrosion control (60). In the mid-1990s in the District of Columbia (DC), high levels of free chlorine were used to decrease coliform bacteria in water, a process that inadvertently changed the type of lead mineral coating in the water lines to one with very low solubility in the background pH of the DC drinking water. When the free chlorine was replaced with chloramines, the transformed highly insoluble lead scale minerals were no longer stable and dissolved. Therefore, a substantial level of lead was released from the lead service lines into drinking water at the tap (61). CDC reviewed the relationship between BLLs in children, the presence of a lead service line, and water disinfection practices in DC during 1998–2006 (62). The study reported that the presence of a lead service line was associated with higher BLLs in children. This relationship was most pronounced during 2001 through June 2004, when chloramines were used to disinfect the drinking water without adequate corrosion control (62). An observational study in which the BLLs of children were matched to population-based data of water lead levels during periods when water disinfection practices changed in DC concluded that the increase in water lead levels was associated with an increase in the BLLs of children (63). In a study in Wayne County, North Carolina, a unified geographic information system was used to link BLLs with water service lines made with or without lead. The use of chloramines in water predicted higher water lead levels and BLLs, controlling for well-established, known predictors of BLL (44).”

Ms. Crooks,
I know I already sent you an email but during further research I discovered this. I thought is was something that should be seen with the recent recommendations of Chloramine possibly being added as a solution.
http://www.cdc.gov/mmwr/preview/mmwrhtml/su6104a1.htm?s_cid=su6104a1_w
LCR And Control Measures Sections, 4th paragraph down. This is my concern with the new chemicals the city wants approval for. What happens to the other citizens who do not know they have an elevated lead content or for the ones who have already tested with elevated levels? I know one of the other levels was 37, that was the highest the city had seen before my levels, what will it look like when Chloramine is added?
Thank you

Posted: Nov 03, 2015 3:08 AM CST Updated: Nov 03, 2015 4:44 AM CST

FLINT, Mich. (AP) - Voters are selecting a mayor for Flint, which has been dealing with fallout from drinking water problems.

In Tuesday's election incumbent Dayne Walling, who led Flint amid the public health emergency, faces challenger Karen Weaver, who is seeking her first elected office.

Flint switched from Detroit's system to water drawn from the Flint River last year in a cost-cutting move. Officials recently confirmed that elevated blood-lead levels were found in children. The city reconnected in hopes of resolving the health emergency.

Walling and other officials repeatedly told residents that the water was safe to drink, but Walling says state and federal agencies are to blame for the problems.

The switch happened while Flint was under state emergency financial management. Weaver has focused in part on water issues during her campaign.

http://www.9and10news.com/story/30412218/flint-families-to-receive-new-guidelines-on-reducing-lead-exposure

Posted: Nov 02, 2015 1:37 PM CST Updated: Nov 02, 2015 1:37 PM CST

By Jamie Valentine, Producer

Health officials say they have new guidelines for Flint families dealing with the emergency with the city's water supply.

The Genesee County Health Department and Michigan Department of Health and Human Services will be sending out letters this week on how to reduce lead exposure.

The response comes after elevated blood lead levels were found in some children in Flint.

The city tried to switch over to water from the Flint River.

The city has now reconnected to Detroit's water system to stop any other health emergencies.

The departments recommend children between the ages of 1 and 2 undergo lead testing during routine doctor visits.

They also suggest using filtered water for drinking, cooking and washing fruits.

http://michiganradio.org/post/election-day-tomorrow-heres-whats-happening-around-michigan#stream/0

By Steve Carmody • 21 hours ago

There's not much on the ballot in Michigan tomorrow, but what is there is sparking controversy.

It's election day in Michigan. Here we see campaign signs for just some of the 14 candidates running for a vacant state house seat

There are primaries for three state house seats.

The vacancies came as a result of a retirement, a resignation, and an expulsion.

A sex scandal forced two state lawmakers out of office. Cindy Gamrat and Todd Courser admitted roles in an effort to cover-up their extra-marital affair.

Courser resigned his seat. The state House voted to kick Gamrat out.

Gamrat and Courser are now running in crowded primary fields to regain their former seats.

Gamrat is facing off against seven other candidates in the 80th district.

Courser is one of 14 candidates in the 82nd district.

Voters in west Michigan are also voting to fill a vacant state house seat.

Former state representative Brandon Dillion retired so he could take over as the head of the state Democratic Party.

Three candidates are on the ballot today to replace him in the 75th state house district.

The top two vote-getters in each race will face off in March to decide who will serve out the time remaining in their current terms.

Other races on the ballot

Flint

In Flint, the city's drinking water problems are expected to play a big role in the city's mayoral race.

Incumbent Dayne Walling is facing a strong challenge from newcomer Karen Weaver.

Weaver has worked hard to tie Walling to the decision to switch and stay with the Flint River as the city's drinking water source.

Walling says he worked to switch Flint back to Detroit water after rising lead levels were discovered in the city's tap water.

Kalamazoo

Kalamazoo voters will get a chance to do something they haven't done in a century, that is directly elect their city's mayor.

A charter change gave voters the chance to directly pick their city's chief executive.

Prior to this year, Kalamazoo's mayor was the city commission candidate who received the most votes. Incumbent mayor Bobby Hopewell is seeking his fifth term against challenger Kris Mbah.

In Kalamazoo, there's a proposed millage to help the homeless. If approved, the tax money raised would pay for housing for homeless families.

Lansing

Lansing voters are deciding four city council races that may determine the balance of power on the council.

Voters in Lansing will also decide if they want to ban so-called 'golden parachutes' for top city appointees.

A $600,000 settlement with the former general manager of the Lansing Board of Water & Light prompted the proposed charter change.

Under the proposal, city appointees would be limited to one year contracts.

What's happening in your area?

Elsewhere, voters are deciding proposed charter changes and millage questions.

To find out what's on your ballot, go to this resource page from the Michigan Secretary of State.

http://wkar.org/post/emergency-mgr-darnell-earley-defends-flint-role-detroit-schools-plan

By Mark Bashore • 20 hours ago

Detroit Public School Emergency Manager Darnell Earley was formerly EM for the city of Flint.

Twice, Delta Township resident Darnell Earley has been appointed as an Emergency Manager in Michigan: once in Flint and currently in the Detroit Public Schools. Current State talks with Earley about the Flint water switch and why he thinks the legislature should pass the Governor's Detroit schools funding plan.

Listen at link

As the former Emergency Manager of the city of Flint, our first guest has come under fire recently. Many are blaming Darnell Earley for not stopping the city's decision to switch its water source to the Flint River. The move led to dangerously high lead levels in drinking water.

Earley left his Flint position early this year. Today, he is the EM for the Detroit Public Schools, trying to right the historically troubled district. It faces more than a half-billion dollars in debt.

In both roles, the ordained Baptist deacon has remained a resident of Delta Township.

Current State talks with Darnell Earley about the city of Flint and public schools in Detroit.

Subject: Flint water

Hi, I'm working on a story recapping the Flint water problems and comparing them to another recent lead-in-water crisis in Washington, DC. I wonder if EPA region 5 has any response to the requests that EPA investigate what happened.

I am also wondering if region 5 can say anything about its involvement in the response so far -- especially about the Miguel del Toral memo about high lead levels from earlier this year. I got the impression from flintwaterstudy.org that EPA cooperated with the city and state in trying to stifle the message. Will the final report be released?

My number is (202) 624-9396, happy to receive guidance on background.

crisis, kids with elevated blood lead, and NO CORROSION CONTROL PLAN FOR 16 MONTHS, and yet you sit there and do absolutely nothing.

Marc

http://www.npr.org/2015/09/29/444497051/high-lead-levels-in-michigan-kids-after-city-switches-water-source

A draft report from the EPA that was obtained by the ACLU of Michigan also takes the city and state to task.

"Prior to April 30, 2014, the City of Flint purchased finished water from the City of Detroit which contained orthophosphate, a treatment chemical used to control lead and copper levels in the drinking water," the report read, adding that the treatment was discontinued after the switch to Flint River water.

"In accordance with the Lead and Copper Rule (LCR), all large systems ... are required to install and maintain corrosion control treatment for lead and copper. In the absence of any corrosion control treatment, lead levels in drinking water can be expected to increase," the report continued.

A Solution May Be Near

But officials with the Michigan Department of Environmental Quality dispute the findings of the draft report. MDEQ spokesman Brad Wurfel says the report was the work of a "rogue employee," and promised the final report — not yet released — would tell a much different story.

"You have to have to do a full year of studying" the water chemistry as it behaves across the system before implementing corrosion control, Wurfel says, adding that's the only way to know how much phosphate to add to the water.

Subject: Tuesday's meeting clarification

Bob,

I wanted to get quick clarification on events for Tuesday morning. I thought I heard that Susan Hedman will be meeting with Rep Kildee at 9 am and that the Task Force will meet with him at 10 am. Is this correct? Will we also meet with Susan? Mike and I just want to make sure our management is aware.

Secondly, we have some contacts in Hurley Medical center, two local universities, and possibly HUD. Would it be possible to make an effort to meet with some of these folks if possible. And there is also the opportunity to see the water plant. What are your thoughts about other meetings we could have while visiting?

Thanks, Darren

Bob,

Thanks for the edits. Attached is a copy of the letter sent to the City of Flint today. We have made some minor edits but did emphasize that EPA is available for doing analysis and that a certified lab must analyze any sample that will be used tin the calculation of the 90 percentile of the Lead/Copper rule. We also added the additional point for sampling beyond the ten identifies.

Thanks for your assistance and your quick turn around.

DEQ will be sampling 2 more schools on Saturday as we discussed earlier in the week. Plumbing assessments were completed today.

Subject: EPA Task Force comments on letter sending Flint Corrosion Control Permit

Jim,

On behalf of the Task Force, thank you for sending us the corrosion control plan letter this morning for our review. Attached please find EPA's edits to that letter. We also understand that MDEQ will issue an amended permit shortly to take account of the Task Force's comments sent to you today.

EPA encourages the City to take advantage of our offer for analytical support as our laboratory can analyze for a more robust set of parameters. The presence or absence of these additional parameters has provided valuable information and insights in past efforts on identifying potential sources of lead.

The Task Force believes Flint should implement the additional corrosion control treatment as soon as possible. The letter and amended permit are an important step in making sure additional corrosion control takes place quickly and appropriately.

Flint — The U.S. Environmental Protection Agency is expected to release results of its review of the troubled municipal water supply in Flint by the end of this week.

Regional administrator Susan Hedman of the Environmental Protection Agency said in a letter Tuesday to U.S. Rep Dan Kildee of Flint that she was asked by the head of the federal agency to carry out the review that the lawmaker requested last month. The Flint Journal reports that Kildee asked for a review of the agency's oversight of state programs assuring safe drinking water in Flint.

Hedman's letter said the agency will conduct a review of action taken by the city to address problems with the quality of its drinking water.

Researchers found elevated blood-lead levels in children whose Flint homes received river water.

FLINT, MI -- Flint's water crisis is getting a review by the U.S. Environmental Protection Agency, and the results are expected to be known by the end of this week.

EPA Regional Administrator Susan Hedman said in a letter today, Nov. 3, to U.S. Rep Dan Kildee, D-Flint, that she has been asked by the head of the EPA to carry out the review that the congressman requested last month.

The EPA will conduct a "full review of actions taken to address drinking water quality issues in Flint," the letter says.

Kildee's request asked at a minimum for a full review of EPA's oversight of state programs assuring safe drinking water in Flint.

Both Kildee and state Senate Minority Leader Jim Ananich, D-Flint, requested the reviews in separate letters to Gina McCarthy, administrator of the EPA, on Oct. 21.

"In order to restore confidence, and to ensure that these failures never happen again, I believe that the EPA needs to conduct a thorough investigation into the causes of the water problems in Flint," Kildee wrote.

Kildee also requested that the agency answer questions, including whether the EPA was aware that the Michigan Department of Environmental Quality was enforcing the wrong guidelines for water quality in Flint and whether the EPA notified MDEQ that the city should have treated water from the Flint River to make it less corrosive.

Researchers from Virginia Tech university and a Hurley Medical Center doctor discovered high lead levels in Flint's water supply and rising blood lead levels in children since the city switched its water source from Lake Huron to the Flint River in April 2014.

DEQ Director Dan Wyant has said that state regulators mistakenly allowed the city to distribute river water without requiring that it be treated to make it less corrosive.

The corrosive water has caused transmission lines in the city to leach lead at a higher rate into tap water, officials have said.

By Steve Carmody & The Associated Press • 10 hours ago

Flint voters have chosen a new mayor.

Mayor-elect Karen Weaver hugs supporters after winning Tuesday's mayor's race in Flint

Credit Steve Carmody / Michigan Radio

Karen Weaver was surrounded by jubilant supporters last night as she rolled to victory in Flint's mayor's race.

Weaver, a political newcomer, defeated six-year incumbent Dayne Walling by a convincing margin.

"We voted for change so some things have to be different," says Weaver, "but at this point I want to start with putting together a team so we can look and see what we need to do."

During the campaign, Weaver repeatedly hammered Walling on his handling of the city's drinking water crisis.

Flint switched from Detroit's system to water from the Flint River last year in a cost-cutting move. Officials recently confirmed elevated blood-lead levels were found in children.

The city reconnected to Detroit in hopes of resolving the emergency as it awaits completion of a pipeline to Lake Huron.

Walling and other officials repeatedly told residents the water was safe but blamed state and federal agencies for the problems. The original switch happened while Flint was under state emergency financial management.

Flint Mayor Dayne Walling hugged and shared a few words with supporters at his election night watch party after he defeat became evident.

Credit Steve Carmody / Michigan Radio

The campaign behind her and Flint's water crisis, along with other problems ahead of her, Weaver has to prepare to take over the mayor's office next week.

"I don't want to make any quick decisions, hasty decisions, I want it to be very well thought out," says Weaver, who plans to put together a transition team to prepare for her taking office next Monday.

For his part, a somber Dayne Walling hugged supporters at his election night watch party.

Walling declined to talk to reporters.

http://www.detroitnews.com/story/news/local/michigan/2015/11/03/flint-mayor-water-problems/75126158/

Associated Press 11:27 a.m. EST November 4, 2015

Flint — Voters have ousted the mayor of Flint, Michigan, amid a fallout over the city's drinking water problems.

Newcomer Karen Weaver beat incumbent Dayne Walling in Tuesday's election. Walling led the city amid the public health emergency.

Flint switched from nearby Detroit's system to water from the Flint River last year in a cost-cutting move. Officials recently confirmed elevated blood-lead levels were found in children.

The city reconnected to Detroit in hopes of resolving the emergency as it awaits completion of a pipeline to Lake Huron.

Walling and other officials repeatedly told residents the water was safe but blamed state and federal agencies for the problems. The original switch happened while Flint was under state emergency financial management.

Weaver, a psychologist, focused on water issues during her campaign. She said Flint needs leaders who will "speak out."

Subject: Tuesday's meeting clarification

Bob,

I wanted to get quick clarification on events for Tuesday morning. I thought I heard that Susan Hedman will be meeting with Rep Kildee at 9 am and that the Task Force will meet with him at 10 am. Is this correct? Will we also meet with Susan? Mike and I just want to make sure our management is aware.

Secondly, we have some contacts in Hurley Medical center, two local universities, and possibly HUD. Would it be possible to make an effort to meet with some of these folks if possible. And there is also the opportunity to see the water plant. What are your thoughts about other meetings we could have while visiting?

Thanks, Darren

Jim,

On behalf of the Task Force, thank you for sending us the corrosion control plan letter this morning for our review. Attached please find EPA's edits to that letter. We also understand that MDEQ will issue an amended permit shortly to take account of the Task Force's comments sent to you today.

EPA encourages the City to take advantage of our offer for analytical support as our laboratory can analyze for a more robust set of parameters. The presence or absence of these additional parameters has provided valuable information and insights in past efforts on identifying potential sources of lead.

The Task Force believes Flint should implement the additional corrosion control treatment as soon as possible. The letter and amended permit are an important step in making sure additional corrosion control takes place quickly and appropriately.

Subject: EPA Flint Safe Drinking Water Task Force

Hey Jordan:

As promised, here's the list of EPA's Flint Safe Drinking Water Task Force Members:

Robert Kaplan, EPA Deputy Regional Administrator

Tom Poy, EPA Region 5 branch chief who runs our safe drinking water programs

Miguel DelToral, Region 5 drinking water expert with particular expertise on lead in drinking water

Tim Henry, Deputy Director of the Region 5 Water Division

Jeff Kempic, EPA regulatory manager for the lead and copper rule

Michael Schock, EPA researcher from our Cincinnati lab with expertise in corrosion control and drinking water treatment

Darren Lytle, EPA researcher from our Cincinnati lab with expertise in corrosion control and drinking water treatment

Points of Contact:

Natasha Henderson, Flint City Administrator

Jim Sygo, MDEQ

In addition to Susan Hedman, Tinka Hyde, a press person and I will attend next Tuesday's briefing for your boss.

Please let me know if you have additional questions or need anything else.

Have a good evening - hope you're going home soon!

Thanks,
Denise

Subject: MI Public Radio LCR Interview readout and audio

Attached is the audio from Peter's interview with Michigan Public Radio this afternoon. He did an excellent job of giving comprehensive, high level answers to the reporter's at times very detailed questions.

He walked the reporter through some general background on the LCR, including the original intent of the rule and what changes EPA is looking to make to ensure better corrosion control as outlined in the memo sent to the regions last night. He also explained primacy, putting it in context of how the broader SDWA works. He also gave a good closing statement reiterating EPA's commitment to providing safe drinking water, acknowledging that we're continuing to improve LCR to be even more protective of public health.

The more intricate questions involved testing methodology, specifically talking through what first draw sampling entails. He explained the complications around replacing lead lines, including partial replacements and the problems that could occur as a result. Again, Peter was able to bring these detailed questions back into the context of what EPA is doing moving forward to prevent situations like Flint from happening again.

The reporter was very appreciative of the time with Peter and didn't get into any direct line of questioning about Flint. She'll be ready to talk to Susan when we're able to make it happen next week.

Thanks for everyone's work on this.

I agree with Darren and I am also getting concerned about timing and all the prep work that we have to do. We need to get some stuff down asap or things are going to get considerably more complicated after winter takes hold in Flint. I think we really need to talk to the City folks about what the ORD needs are while we are out there and try to get some at least verbal commitment from them. We are going to need some pipe excavated for the pipe loops in the treatment plant and we are in November, so folks need to keep in mind that if we don't get those pipes out now, we won't have anything to work with until Spring. Ahead of that, we don't have any information on where these lead lines actually are and we obviously have to know where they are to extract them. The records are old, so we will need to verify that the sites still have lead lines. I also need to know who the players are going to be (for City of Flint, Universities, etc.) before I can start discussing needs with our lab or working on the required QAPP.

To add to Miguel's concern, we need to find out if there's a commitment for the DBP, Coagulation/Filtration, disinfection, softening (need or not need), pH adjustment, and other necessary studies on how they're going to handle the Lake Huron water change. That is necessary to provide the background water quality for the second set of pipe rigs, which would then look at phosphate dosage optimization with the new water. Since that schedule doesn't seem to be very flexible for Flint, the studies need to start absolutely as soon as possible.

Subject: FW: EPA Task Force comments on letter sending Flint Corrosion Control Permit

Task Force:

Please see the attached final letter sent today by MDEQ.   Please see the exchange below as well.

Many thanks for your quick turnaround today, and thanks particularly to Tom for consolidating the comments into the edited letter.

- Bob

Subject: RE: EPA Task Force comments on letter sending Flint Corrosion Control Permit

Bob,
Thanks for the edits. Attached is a copy of the letter sent to the City of Flint today. We have made some minor edits but did emphasize that EPA is available for doing analysis and that a certified lab must analyze any sample that will be used tin the calculation of the 90 percentile of the Lead/Copper rule. We also added the additional point for sampling beyond the ten identifies.
Thanks for your assistance and your quick turn around.

DEQ will be sampling 2 more schools on Saturday as we discussed earlier in the week. Plumbing assessments were completed today.

To: Sygo, Jim (DEQ)
Subject: EPA Task Force comments on letter sending Flint Corrosion Control Permit

Jim,

On behalf of the Task Force, thank you for sending us the corrosion control plan letter this morning for our review. Attached please find EPA's edits to that letter. We also understand that MDEQ will issue an amended permit shortly to take account of the Task Force's comments sent to you today.
EPA encourages the City to take advantage of our offer for analytical support as our laboratory can analyze for a more robust set of parameters. The presence or absence of these additional parameters has provided valuable information and insights in past efforts on identifying potential sources of lead.
The Task Force believes Flint should implement the additional corrosion control treatment as soon as possible. The letter and amended permit are an important step in making sure additional corrosion control takes place quickly and appropriately.

Video report at link

(WXYZ) - 7 Action News Investigator Jim Kiertzner has a stunning investigation into the Flint water crisis and the severe and long-lasting impact it will have on countless families!

Jim has talked with a Flint mother about the many health issues her family is dealing with after drinking the contaminated water for months.

Jim also takes a deeper look into how the issue began and the warning signs that some say were ignored.

See his complete report Thursday on 7 Action News at 11 p.m.

http://detroit.cbslocal.com/2015/11/04/mayor-elect-says-flint-needs-to-be-declared-a-national-disaster-area/#.VjpSrSxQ850.twitter

November 4, 2015 1:44 PM

FLINT (WWJ/AP) – Flint Mayor-Elect Karen Weaver says the city is in desperate need of federal help over its water crisis.

“Flint really needs to be declared a national disaster area,” Weaver, who will be Flint’s first female mayor when she’s sworn in next Monday, told WWJ’s Beth Fisher.

Flint last month reconnected to Detroit’s water system in hopes of resolving a health emergency spurred by a switch to river water that was aimed at saving money but left children with elevated lead levels.

Residents were urged not to drink the water, a public health emergency was declared and it cost about $12 million to make the switch.

“We’ve got some challenges here because, even though we’ve switched back to the Detroit water, our infrastructure has been damaged,” Weaver said. “And so we still have issues with lead coming though the water.”

Using the Flint River was supposed to be an interim source until the city can join a new system getting water from Lake Huron that’s scheduled to be completed next year.

Residents complained about the smell, taste and appearance of the river water, and reported adverse health reactions. A General Motors plant stopped using the water because it was causing excessive rust.

Officials said Flint residents might still see discoloration or notice some taste and odor issues during the transition back to Detroit water as the city's primary interim source.

"We know that this city nor the state has the resources to handle this, so we need some federal assistance," she said. "So that's one of the things that, you know, we've talked about. And so I need to reach out and work with our state representatives and our senator and work with the governor to get this thing going, because we need help in the city of Flint."

Gov. Rick Snyder already approved $9.3 million in water-related aid for Flint that includes money for home water filters inspections, health services and lab testing.

Michigan Senate Minority Leader Jim Ananich, of Flint, says there are a lot of questions yet to be answered concerning the city's water woes.

Speaking live on WWJ on Wednesday, Ananich said job number one is making sure the water is totally safe for residents.

"The source of the water is much safer now," Ananich said. "It still takes time for the corrosion control to recoat the pipes and have water that people can be assured is drinkable, so people still need to take precautions.

"But now we're sort of in the phase of investigating what happened."

Flint began using the Flint River for its water supply in April of 2014.

http://michiganradio.org/post/flint-mayor-leaving-office-after-defeat-not-politics

By Steve Carmody • 18 hours ago

ShareTwitter Facebook Google+ Email

After six years at city hall, Flint Mayor Dayne Walling only has a few days to clean out his office to make way for his successor.

Flint Mayor Dayne Walling prepares to leave office after 6 years

Walling lost his bid for a third term yesterday. Political newcomer Karen Weaver defeated Walling by nearly 2,000 votes. She'll be sworn in next week.

For much of the past decade, Dayne Walling has either been running for Flint mayor or serving as mayor.

In 2007, he lost to former Mayor Don Williamson. In 2009, he won a partial term as mayor after Williamson resigned. Walling was elected to a full term in 2011.

As he prepares to leave office, Walling is thanking his supporters and pondering his future.

"I'm going to take a couple months to reflect on my time in service and the lessons learned," says Walling, "and have conversations with a lot of people I trust on how I can continue to contribute to Flint and to Michigan's recovery and turnaround."

Walling says he plans to continue to be part of "public life" and says running again for elected office is a strong possibility.

"I'm not ruling out a future run for mayor, or for legislature or another office," says Walling.

The outgoing mayor is still stinging from his defeat this week.

Walling says he's "frustrated" that his critics were able to convince many voters that he bore responsibility for the city's drinking water problems.

During an 18-month experiment, Flint got its tap water from its namesake river. The move proved disastrous, starting with complaints about the water's taste and smell, and then escalating to problems with dangerously high chemical and lead levels. The crisis eventually became the main issue in the campaign.

Walling blames state and federal agencies for not doing their job to ensure the water met safety standards.

He objects to those who lumped him with state appointed emergency managers who made decisions about the city's water system.

"That was done to score political points," says Walling. "It wasn't an accurate depiction. But campaigns are tough."

Walling also knows it's tough starting a new job as mayor.

Karen Weaver will be sworn into office next Monday. She's setting up a transition team to help her move into the new job.

Walling says when he became mayor he had more than a dozen top appointments to make to city hall departments.

But the mayor says now much of that authority rests in the hands of Flint's city administrator.

"The city administrator is responsible for all the city's personnel," says Walling. "It's a different process. This will be the first time the city will be going through this following an election transition. We'll all be watching to see how it goes."

http://www.mlive.com/news/flint/index.ssf/2015/11/mdhhs_will_distribute_water_fi.html

By Jiquanda Johnson | jjohns16@mlive.com
on November 05, 2015 at 5:00 AM, updated November 05, 2015 at 7:47 AM

FLINT, MI - Genesee County agencies are set to give Flint residents replacement cartridges for filters distributed in the city to prevent lead from getting into their drinking water.

The Genesee County Health Department issued a press release reminding city residents that water filters will need to be changed soon.

The Genesee County Community Action Resource Department and Michigan Department of Human Services started distributing replacement cartridges Wednesday, Nov. 4.

GCCARD clients can pick up cartridges from 9 a.m. to 4 p.m. Monday through Friday at 601 N. Saginaw St., Suite A or at 2727 Lippincott Boulevard.

Michigan Department of Human Services will distribute replacement cartridges at the same time but at its 125 E. Union St. and 4809 Clio Road offices.

Residents must know whether their filter is a Pur or Brita system when picking up cartridges.

Flint residents who own a Pur water filter system should receive a blinking light warning on the filter when it needs to be changed. Officials say if the yellow light is blinking it is a warning that the filter will need to be changed soon. A blinking red light means that the filter needs to be changed immediately. According to the manufacturer, the system can filter up to 100 gallons of water per filter cartridge.

Home Depot District Manager, Don Mandeville Demonstrates Free Water Filters To Be Given To Flint Residents Home Depot District Manager, Don Mandeville Demonstrates Free Water Filters To Be Given To Flint Residents

Owners of the Brita water filtering system also have a blinking light indicator. A red light indicates the filter needs to be changed immediately.

For more information on cartridge distribution sites, call 2-1-1 or visit the Genesee County Health Department's website here.

FLINT, MI — City residents should be warned of the potential risk of increased lead in drinking water when crews do underground work that could dislodge scale and sediment in water pipes, the U.S. Environmental Protection Agency told the city and state Wednesday, Nov. 4.

A final report from the EPA regarding high lead levels in drinking water at three homes in Flint warns of the danger, not only of lead leaching directly into water from lead service lines leading to individual homes, but for lead to have spread to pipes made of other materials, such as galvanized pipe or interior plumbing.

"(The) presence of lead pipes over many years has likely resulted in the accumulation of lead in the scales within non-lead pipes downstream of the lead pipe and physical disturbances to (either) portions of the service lines have the potential to release large amounts of scale and sediment that could pose an immediate and acute health hazard to the residents," the report said.

A cover letter on the EPA report said it was sent to the state Department of Environmental Quality and the city of Flint.

Both Brad Wurfel, a spokesman for the DEQ, and Flint Public Works Director Howard Croft said they had not yet reviewed the new EPA report and could not comment on it immediately.

Marc Edwards, a professor from Virginia Tech university, said the EPA report is not surprising, confirming previous studies that have warned of the effect of disturbing water pipes where lead has built up in scale and sediment.

In the case of Flint's water transmission system, the problem is especially serious because of the large number of lead service lines and the failure to treat Flint River water to make it less corrosive.

Although the city was reconnected to the Detroit water system last month after researchers found increasing lead levels in Flint water and in the blood of infants and children in the city, the city's use of corrosive river water contributed to the potential for scale and sediment containing lead to break free from pipes and enter tap water, Edwards said.

DEQ Director Dan Wyant last month said his agency mistakenly never required Flint to treat river water to make it less corrosive because it followed the wrong federal regulations for the water system.

Edwards said the report on Flint's lead-in-water crisis could help lay the groundwork for new federal regulation on partial replacement of lead service lines and protocols for disturbance of water lines containing lead.

The EPA letter said its report on lead in Flint water is being sent to the National Drinking Water Advisory Council for discussion during its upcoming meeting later this month.

It suggests that underground extraction and handling procedures be developed by the federal government that would minimize the potential for disturbing lead in water lines.

"I think it's a big admission that these lead pipes are dangerous," Edwards said of the potential for large releases of scale and sediment containing lead when pipes are disturbed.

The EPA report said that, even with corrosion control having been returned to Flint's water system after 17 months, "physical disturbances will be capable of dislodging the high-lead bearing scale and sediment from non-lead pipes as well as lead pipes. ..."

"At a minimum, immediate training and public education on the potential risks posed by physical disturbances to service lines should be developed by communications experts and provided to residents, community groups, elected officials, health departments, pediatricians and gynecologists, water and non-water utilities, plumbing organizations and contractors," the report said.

"Residents should be notified of scheduled work by water and non-water utilities and informed of the potential risk of increased lead levels due to these disturbances."

A public health emergency was declared for Flint last month after Edwards' researchers and a Hurley Medical Center doctor found rising lead levels in the city since Flint began using river water that had not been treated to reduce corrosion.

Reviews of the actions that led to the spike in lead levels have already been initiated at the local, state and national levels.

Health officials have advised city residents to continue using lead-clearing water filters, thousands of which have been distributed in the city, to combat lead in the water supply.

There's that old parable about a group of blind men trying to describe an elephant: One touches the tusk, one the trunk, another the legs. Each account differs; no one could ever imagine an elephant was the subject of such disparate descriptions.

That's what the efforts to determine exactly how the City of Flint's drinking water was compromised bring to mind.

State Senate Minority Leader Jim Ananich, a Flint Democrat, is asking Senate Majority Leader Arlan Meekhof, a West Olive Republican, to create a legislative committee to examine exactly what went wrong. Meekhof hasn't formally responded, but he should take Ananich's proposal seriously. A legislative committee's examination of the Flint debacle -- with subpoena power, conducted in the public eye -- could prove a valuable tool not just for figuring out what went wrong, but recommending policy changes to ensure that it can't happen again.

Back in 2013, Flint opted to join a new regional water authority, and decided in 2014 to pump its water from the Flint River while the new system was under construction. Because the city's treatment plant didn't add the right chemicals to the water, lead leached from aging service lines into the river water, contaminating the city's drinking supply and pushing lead levels up in more Flint kids. The Michigan Department of Environmental Quality now admits it erred in OK'ing Flint's water treatment plan.

Gov. Rick Snyder has formed a task force to deliver an "after-action report." The task force's four members are men of integrity and expertise in relevant fields; there's no question that they're committed to finding the truth. But because that task force doesn't have subpoena power, it's relying on cooperation from the agencies involved. (And if the way those entities respond to media requests is anything to go by, good luck, friends.) Worse, the governor does not consider his office subject to the state law that requires government agencies to disclose records -- if it's created on the public dime, the public should have access, the logic behind the law goes.

But because Snyder, and other Michigan governors, have held themselves apart from the law almost every other state and local government entity must comply with, the task force's findings aren't guaranteed to become public; rather, when and whether the task force's work is complete, the public will gain access to its findings and conclusions only at the governor's discretion.

The EPA is conducting its own review, at the behest of EPA Administrator Gina McCarthy, who was asked by Ananich and U.S. Rep. Dan Kildee, also a Flint Democrat, to investigate. But the EPA is charged with overseeing drinking water standards, and months of emails obtained under the state's Freedom of Information Act show MDEQ and the EPA exchanged numerous emails about the Flint water situation; both agencies knew lead levels had risen in the city's water months before taking action.

Ananich has also asked the state Auditor General to examine some aspects of the decision-making process.

But all of these are imperfect solutions.

As Ananich notes in a letter to Meekhof, sent Thursday, some investigations lack authority to compel disclosure, while others require government agencies to examine themselves.

A legislative committee has its own pitfalls -- politics, politics, politics -- and it shouldn't replace the other, ongoing investigations and examinations of the Flint water crisis. But the transparency and accountability it could lend to the process could be invaluable.

Meekhoff -- and other Senate Republicans -- should support this effort. There's too often a temptation to divide these things up along party lines. But access to clean, safe drinking water shouldn't be a partisan issue. If it happened in Flint, where else could it happen? That's the question Ananich, Meekhof and the state Senate should try to answer.

http://www.detroitnews.com/story/news/local/michigan/2015/11/05/flint-water/75205332/

Associated Press 8:46 a.m. EST November 5, 2015

Flint — Flint residents should be warned of the potential risk of increased lead in drinking water when crews do underground work that could affect pipes, according to a report from the U.S. Environmental Protection Agency.

The recommendation was included in an EPA report released Wednesday about high lead levels in drinking water at three homes. The EPA said the report is being sent to the National Drinking Water Advisory Council for discussion next month, The Flint Journal reported.

The report warns that lead can not only get from aging lead lines into individual homes, but can spread to galvanized pipe or interior plumbing. Lead that builds up inside non-lead pipes can be released when it is disturbed by construction or other work.

According to the report, this has “the potential to release large amounts of scale and sediment that could pose an immediate and acute health hazard to the residents.”

Flint switched from Detroit's water system last year to Flint River water in a cost-cutting move while under state emergency financial management. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron that is scheduled to be completed next year.

Residents complained, however, about the taste, smell and appearance of river water coming into their homes and businesses. Officials long maintained the water met safety standards, but it was later determined that corrosive river water was drawing lead from aging pipes.

Marc Edwards, a Virginia Tech researcher who helped raise concerns about Flint's water system, said the EPA report confirms previous studies that have warned of the effect of disturbing water pipes where lead has built up in scale and sediment.

"I think it's a big admission that these lead pipes are dangerous," Edwards said.

The report was released a day after voters ousted Flint's mayor amid a fallout over the city's drinking water problems. In Tuesday's election, newcomer Karen Weaver beat incumbent Dayne Walling, who led the city amid the public health emergency.

Walling and other officials blamed state and federal agencies for the city's water problems. The city has since switched back to Detroit's water system.

Subject: RE: Comments on Flint Water

Susan – we prepared the following for your consideration:

Dear Mayor Walling,

Thank you for your message. I sincerely regret that you learned about the Region's investigation of lead contamination in drinking water samples and our concerns in the manner you did. The interim report that was shared by staff contained draft findings and recommendations for management review; it is being revised to address comments and should not have been released outside of the Agency.

Region 5 staff have been responding to a citizen complaint regarding lead concerns since February 25, 2015. In addition, we have had a number of conversations with MDEQ regarding Flint's switch to a new source of water and the resulting water quality challenges. My staff have been out to Flint to collect samples and data, which we felt could both help understand the situation in Flint and inform national drinking water program rulemaking on lead and copper. Staff was requested to prepare a report summarizing the visits and initial findings and offering recommendations for management consideration. A memorandum with this information was shared with management last week and was to be revised to address comments.

In most cases, an internal EPA memo summarizing initial, draft findings and recommendations for management consideration would not be distributed outside the Agency. However, given his interaction with the homeowner for one of the sampling locations, the staff person shared a copy of the memorandum as a courtesy with this Flint resident since her name and children's blood lead levels were referenced. The ACLU representative, Curt Guyette, contacted our staff person on the evening of June 29 saying that he had received a copy of the internal memo from the resident, and our staff person answered Mr. Guyette's questions about the contents of the memo.

Once revised and fully vetted with EPA management, the findings and recommendations will be shared with MDEQ, and can also be shared with you. We will be discussing appropriate regulatory next steps with MDEQ which would as the Primacy Agency then be responsible for following up with you in Flint. We have a conference call scheduled with MDEQ on July 21st after the two rounds of 6-month monitoring results are available. In the short term, however, we believe that Flint's Advisory Committee would benefit from additional EPA-ORD assistance regarding lead and distribution system issues to complement the TTHM expertise provided by Dr. Wright. The bios of the 2 staff we are suggesting can be provided to you if interested.

Again, I regret the manner in which this information reached you. Please feel free to contact me if you have any further questions.

Subject: Water treatment
To: Jason Lorenz <jlorenz@cityofflint.com>

Jason,

I have interviewed Miguel Del Toral, regulations manager for ground and drinking water for the EPA's region 5.

He said there are a number of concerns regarding Flint.

Among other things, he said:

A major concern from a public health standpoint is the absence of corrosion control treatment in the City of Flint for mitigating lead and copper levels in the drinking water.

Recent drinking water samples indicate the presence of high lead results in the drinking water.

In addition to the lack of corrosion control, the ferric chloride being added to help address the TTHM problem can accelerate pipe corrosion, exacerbating the problem.

He also said that the city's testing procedures – instructing residents to "pre-flush" their lines before taking water samples to be tested, can lead to deceptively low results that could give Flint residents a false sense of security regarding actual lead levels in their water.

Obviously, this is a very urgent issue. I am interested to talk with someone from the city about what Mr. Del Toral had to say. Can you set up a phone interview with someone for me to talk with tomorrow? I can make myself available whenever is convenient for you.

If you need to talk with me beforehand, you can reach me on my cell phone at 586-925-0493.

Thanks for any help you can provide.

Curt Guyette

Subject: Re: HIGH LEAD: FLINT Water testing Results

Jen/all - I think things got garbled in translation...

What I was saying is that where you find Pb values that high, it is usually due to particulate lead. Not always, but generally. Particulate lead is released sporadically from lead service lines, leaded solder and leaded brass in a number of ways and folks tend to discount these values as anomalies, but particulate lead release is a normal part of the corrosion process and it is universal (common) in all systems. It's just that it is not captured as often by the infrequent LCR sampling. If systems are pre-flushing the tap the night before collecting LCR compliance samples (MDEQ still provides these instructions to public water systems) this clears particulate lead out of the plumbing and biases the results low by eliminating the highest lead values. If systems are pre-flushing and still finding particulate lead, the amount of particulate lead in the system can be higher than what is being detected using these 'pre-flushed' first-draw samples. My point on that was that people are exposed to the particulate lead on a daily basis, but the particulate lead is being flushed away before collecting compliance samples which provides false assurance to residents about the true lead levels in the water.

Some quick notes on particulate lead release:

- Fe/Mn can transport lead from the lead service lines into the home. The lead sorbs onto the Fe/Mn particles. In GW systems, Fe/Mn can come from the source water and more Fe from the water mains. In SW systems, the Fe typically is released from the water mains.
- Lead released from lead service lines can also 'seed' galvanized iron pipes inside the homes. Again, the lead sorbs onto the iron on the pipes and be released sporadically. Generally, the higher the flow, the more Fe and Fe+Pb particulate you will likely get.
- If there is a partial lead service line (lead connected to copper) you can get additional lead release due to galvanic corrosion.

- Leaded brasses and solder can also release particulate lead under certain circumstances.
- The particulate can contain very high concentrations of lead (hundreds to thousands of ppb Pb) which is a much higher concentration than lead paint, so even small particles can result in high lead values.
- If the lead service line was disturbed (water main repair/replacement, meter installation repair/replacement, service line leak repairs, etc.) you can have VERY high lead levels in the scale and sediment that is dislodged from the inside of lead service lines. Here in Chicago, during a partial lead service line replacement, we collected the scale and sediment that came into the home and we found 300,000+ ug/L lead in the scale; 125,000 ug/L Pb in the sediment. Very dangerous.
- Higher levels of PO4 (3-4 mg/L Ortho) seem to reduce the amount of particulate Pb that is released in the absence of physical disturbances to the lead lines. Doesn't stop it entirely, but should generally reduce the occurrence. Caveat – Other water quality issues can change the chemical complexes that form on the pipe, so cleaner sources with more consistent WQ form more predictable scale complexes.

If I remember correctly, Detroit is feeding PO4 for the LCR, but since Flint is no longer part of that interconnection, I was wondering what their OCCT was. They are required to have OCCT in place which is why I was asking what they were using.

Mike Schock is our resident expert and may be able to help out with the simultaneous compliance (Pb & DBPs) so I would suggest that folks give him a call.

Subject: HIGH LEAD: FLINT Water testing Results

Thank you, Mike. These results are dated 2/18/15, so they're probably different results than the results Adam had, but they still have to be included in with compliance calculation of the 90th percentile. What dates are the earlier compliance samples?

Yes, the stagnation of the water would increase the lead levels, and I'm glad you're following up with the City to get the lead levels reduced for Citizen name / Ex. 6 home—which will hopefully be effective for her neighbors because they are also most likely being exposed to these high lead levels. Miguel reminded me this morning, there are no safe levels of lead in drinking water.

I talked with Miguel Del Toral about his knowledge on research on lead. He said that high levels of iron, usually bring high levels of lead. The large amount of black sediment at Citizen name / Ex. 6 home, is most likely particulate lead, Miguel said, where the lead actually bonds to the iron sediment. While the particulates of lead/iron are small, they're very highly concentrated with lead—up to 95% lead.

Miguel was wondering if Flint is feeding Phosphates. Flint must have Optimal Corrosion Control Treatment—is it Phosphates? Or is it pH/Alkalinity Adjustment? The reason he asks, is because systems using the pH/Alkalinity adjustment have problems with lead levels in the 100's or higher—and they have problems with random lead particulate matter in the distribution system. Miguel said that we all know that flushing regularly helps reduce the lead concentrations, but not immediately. The City can't just flush in advance of taking the compliance samples, they have to flush the lines on a regular schedule.

The problem with high lead issues, is that the water has so many different variables, that it's hard to pinpoint what is causing what problem where. From a public health perspective, can we assume that the high lead levels in Citizen name / Ex. 6 neighborhood are isolated to just her area? Or are they more widespread?

Please feel free to contact Miguel directly—312-886-5253; Deltoral.miguel@epa.gov.

Subject: RE: HIGH LEAD: FLINT Water testing Results

Jennifer,

I recall Adam showing me a high lead/copper sample result (perhaps it was this one)....as part of the city's routine lead-copper monitoring. If so, it was a stagnated sample as part of the sampling protocol. Adam mentioned that all other samples were below the AL...and the city will not exceed the lead AL. I will confirm this. The city; however, needs to take further action to help address Citizen name / Ex. 6 concern. The type of plumbing needs to be identified and sample tap location within the premise plumbing. They should offer to re-sample for PB after flushing the tap to demonstrate that flushing the tap will reduce the lead concentration. The city also needs to provide other lead-reduction strategies to M Citizen name / Ex. 6

Subject: HIGH LEAD: FLINT Water testing Results

Hi, Steve and Mike. Thanks for talking with me yesterday, Steve, about the most recent TTHM results. We'll look forward to receiving them whenever you get them back from the lab.

However, the main purpose of my email is to alert you to the high lead levels reported to a citizen yesterday by Flint Water Dept. I have been discussing the water situation with Citizen name / Ex. 6 Citizen name / Ex. 6 since January, and she has been talking with Mike Glasgow at the plant about the black sediment in her water. (HUGE KUDOs to MIKE!!) He did test it to find that the iron levels were greater than his test would go; GT 3.3. But, because the iron levels were so high, he suggested testing for lead and copper. WOW!!!! Did he find the LEAD! **104 ppb.** She has 2 children under Personal Matters / Ex. 6. Big worries here.

So, Steve, this goes back to what you and I were talking about yesterday. That the different chemistry water is leaching out contaminants from the insides of the biofilms inside the pipes. I think Lead is a good indication that other contaminants are also present in the tap water, that obviously were not present in the compliance samples taken at the plant. VOC/SOC and inorganics/metals would be good samples to start with to take at the tap. And since Ms. Walters' drinking water is showing the high lead levels, her tap water would be a good place to start, I think.

We also talked about Dr. Joan Rose from Michigan State being on the Flint Tech Advisory Committee—you also mentioned that someone from the Dept of Community Health was on the Committee. I'm thinking that Dr. Rose would want to dive further into this, since there's actual evidence that the water is leaching contaminants from the biofilms; or Dept of Community Health would want to get involved and look at this from an epidemiological perspective. (She and her family are also exhibiting the rashes when exposed to the water, and her daughter's hair is falling out in clumps.)

Maybe MSU could authorize the payment of the analyses for these samples? Or Dept of Community Health?

Citizen name / Ex. 6

Here are your Lead & Copper Results. This number is very high, 104 ppb of lead. In the last few months over 100 samples have been tested and only 2 were over the 15 ppb regulatory limit, and the highest level I have seen is 37 ppb. I will pass this info to Mr. Croft so he is aware. I will send the sample I collected from your kitchen faucet today for a complete metals test (12 different metals), to see what the level is without letting the water stagnate over night. I'm hoping that value will be much, but we will have to see. Sorry for this news, but I wanted to let you know right away.

Subject: RE: Final Report - Two questions

Mr. Cassell,

I am writing to ask about items that were in Mr. Del Toral's draft memo that aren't addressed in the final report that you sent me.

Specifically, Del Toral raised a red flag about two seemingly critical issues that are absent from the final report:

1. The lack of mandatory corrosion control and its contribution to the crisis; and

2. The MDEQ's protocol of instructing people to pre-flush their systems prior to letting it sit for six hours

Why were these issues not addressed in the final report?

I would appreciate an answer by Monday morning.

Sincerely,

Curt Guyette

November 6, 2015

Administrator Gina McCarthy

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue N.W.
Washington, DC 20004

Dear Administrator McCarthy:

As you know, the City of Flint had, and potentially still could have, dangerous levels of lead in its drinking water. We appreciate the Environmental Protection Agency's (EPA) creation of the Flint Safe Drinking Water Task Force and other efforts to provide access to safe, reliable, clean water to the residents of Flint. We seek further information regarding the sustained commitment by the Task Force to work with the State of Michigan to address the long-term effects of lead exposure on Flint's children.

It is our understanding that the City of Flint, the State of Michigan, and the EPA have monitored the situation in Flint since the first report of poor water quality in 2014. However, it is clear that various opportunities to predict and prevent contamination were not taken, exposing Flint residents, and especially infants and pregnant women, to dangerously high levels of contaminants including, but not limited to, lead. This failure of government to ensure the public's safety and health must not be repeated in Flint or anywhere else. While progress is being made to improve the water quality after reconnecting to the Detroit Water System, Flint's residents and its water system are still vulnerable to short and long-term impacts.

It is critical that the local, state, and federal partners remain vigilant, and that EPA take a strong leadership role through the Flint Safe Drinking Water Task Force to prevent further contamination during the current transition to Detroit and the future transition to the permanent connection to Lake Huron source water through the Karegnondi Water Authority (KWA) pipeline. In an effort to understand the actions being taken by Task Force and address current and future challenges with Flint's water, we seek answers to the following questions:

- How often does the Flint Safe Drinking Water Task Force communicate amongst itself, and what are the communication protocols?

- How long will it take for corrosion control agents to fully create a barrier between water and the inside of the pipes?

- How are testing methods being improved to accurately measure water quality and correct testing mistakes of the past?

- How is the EPA and the Flint Safe Drinking Water Task Force interfacing with other federal agencies, such as the Department of Health and Human Services, the U.S. Department of Agriculture, the Department of Education, and other agencies with respect to the future needs of the residents of Flint stemming from the long-term effects of toxic lead exposure on Flint's children from its drinking water?

- In the future, will the EPA notify residents directly if they believe the local or state government actions are inadequate to properly communicate significant risks to the public?

- The State of Michigan is responsible for ensuring compliance with federal drinking water standards. In addition, the state has elected to assume the legal responsibility for disbursing the resources it receives from EPA's Drinking Water and Clean Water State Revolving Funds. How will the Task Force provide the ongoing, long-term support and oversight needed to ensure the state complies with federal standards and allocates the revolving funds in a manner that most effectively protects public health?

We encourage you to continue monitoring and supporting any and all ongoing measures by the EPA and the Task Force to test for and reduce contaminants in drinking water, prepare for the future transition to the KWA pipeline to Lake Huron, and identify and replace aging water infrastructure. Your presence in Flint will help restore the confidence in the ability of water quality regulators and begin to rebuild the trust in the effectiveness of the critical safeguards found in laws such as the Safe Drinking Water Act.

We appreciate your prompt response to these questions and invitation as well as your continued attention to this matter.

Sincerely,

Gary C. Peters	Debbie Stabenow

Hey Everyone,

I wanted to let you know that we will be sending the attached letter today and I wanted to give you a heads up. Please give me a call and we can talk about it further.

Thanks,

Jordan

November 6, 2015

Administrator Gina McCarthy

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue N.W.
Washington, DC 20004

Dear Administrator McCarthy:

As you know, the City of Flint had, and potentially still could have, dangerous levels of lead in its drinking water. We appreciate the Environmental Protection Agency's (EPA) creation of the Flint Safe Drinking Water Task Force and other efforts to provide access to safe, reliable, clean water to the residents of Flint. We seek further information regarding the sustained commitment by the Task Force to work with the State of Michigan to address the long-term effects of lead exposure on Flint's children.

It is our understanding that the City of Flint, the State of Michigan, and the EPA have monitored the situation in Flint since the first report of poor water quality in 2014. However, it is clear that various opportunities to predict and prevent contamination were not taken, exposing Flint residents, and especially infants and pregnant women, to dangerously high levels of contaminants including, but not limited to, lead. This failure of government to ensure the public's safety and health must not be repeated in Flint or anywhere else. While progress is being made to improve the water quality after reconnecting to the Detroit Water System, Flint's residents and its water system are still vulnerable to short and long-term impacts.

It is critical that the local, state, and federal partners remain vigilant, and that EPA take a strong leadership role through the Flint Safe Drinking Water Task Force to prevent further contamination during the current transition to Detroit and the future transition to the permanent connection to Lake Huron source water through the Karegnondi Water Authority (KWA) pipeline. In an effort to understand the actions being taken by Task Force and address current and future challenges with Flint's water, we seek answers to the following questions:

- How often does the Flint Safe Drinking Water Task Force communicate amongst itself, and what are the communication protocols?

- How long will it take for corrosion control agents to fully create a barrier between water and the inside of the pipes?

- How are testing methods being improved to accurately measure water quality and correct testing mistakes of the past?

- How is the EPA and the Flint Safe Drinking Water Task Force interfacing with other federal agencies, such as the Department of Health and Human Services, the U.S. Department of Agriculture, the Department of Education, and other agencies with respect to the future needs of the residents of Flint stemming from the long-term effects of toxic lead exposure on Flint's children from its drinking water?

- In the future, will the EPA notify residents directly if they believe the local or state government actions are inadequate to properly communicate significant risks to the public?

- The State of Michigan is responsible for ensuring compliance with federal drinking water standards. In addition, the state has elected to assume the legal responsibility for disbursing the resources it receives from EPA's Drinking Water and Clean Water State Revolving Funds. How will the Task Force provide the ongoing, long-term support and oversight needed to ensure the state complies with federal standards and allocates the revolving funds in a manner that most effectively protects public health?

We encourage you to continue monitoring and supporting any and all ongoing measures by the EPA and the Task Force to test for and reduce contaminants in drinking water, prepare for the future transition to the KWA pipeline to Lake Huron, and identify and replace aging water infrastructure. Your presence in Flint will help restore the confidence in the ability of water quality regulators and begin to rebuild the trust in the effectiveness of the critical safeguards found in laws such as the Safe Drinking Water Act.

We appreciate your prompt response to these questions and invitation as well as your continued attention to this matter.

Sincerely,

Gary C. Peters	Debbie Stabenow
U.S. Senator	U.S. Senator

Dan Kildee

Member of Congress

Thanks,

Jordan Dickinson

LANSING, MI — Senate Minority Leader Jim Ananich on Thursday formally requested legislative hearings on the Flint water crisis and response by the Michigan Department of Environmental Quality.

"In the handling of the Flint water case, failures at multiple levels of government led to my community — and particularly its children — being poisoned," Ananich said in a letter to Senate Majority Leader Arlan Meekhof, referencing high lead levels found after a switch to Flint River drinking water.

"We need to make sure that the executive branch is faithfully executing the laws passed by this body and protecting all Michigan taxpayers by making sure the $9.35 million in state funds appropriated for the Flint water crisis are used correctly."

Gov. Rick Snyder has already appointed a task force to review the Flint water crisis. The federal Environmental Protection Agency is also investigating, and the state Auditor General recently agreed to expand an ongoing audit of MDEQ's drinking water division.

But Ananich, in his letter, noted that the task force lacks subpoena power that a Senate committee could use to compel testimony. He pointed out that none of the state or federal probes will require sworn testimony and highlighted a common characteristic: "a branch of government or agency is investigating themselves."

The Flint Democrat proposed a series of six legislative hearings by the end of the year "in an appropriate" Senate committee, such as the newly formed Oversight panel.

Meekhof, R-West Olive, did not sound immediately enthused by Ananich's proposal and does not appear prepared to call for hearings any time soon.

"He and I have been talking about that, but I'd like the folks that are in charge of gathering data and information to do that," Meekhof said, noting that the Senate could have a busy couple months with energy and Detroit education legislation in the pipeline.

Meekhof also offered support for MDEQ Director Dan Wyant, who has faced criticism over his department's handling of the water crisis.

"I believe they will find solutions and they will find the thing that need to be corrected," Meekhof said. "I have very high confidence in the director."

Flint began drawing drinking water from the Flint River in April of 2014, while the city was under control of a state-appointed emergency manager. City Council had previously approved a long-term plan to move off Detroit water and join the new Karegnondi Water Authority but did not vote on using river water in the interim.

Wyant recently replaced the head of the Office of Drinking Water and Municipal Assistance, acknowledging that the state had enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make it less corrosive.

Ananich said public hearings in a legislative committee would further help the public understand the crisis and help the state or other cities avoid similar problems in the future.

"The solution is going to be ongoing when it comes to helping these kids that have brain damage because of the lead," he told reporters after session. "But I think this helps get some accountability. I think citizens deserve that. I think taxpayers deserve that. This could be one way to do it."

http://michiganradio.org/post/flint-restart-water-shutoffs

By Citizen name / Ex. 6 • 19 hours ago

Beginning next month, the city of Flint plans to again disconnect water customers who aren't paying their bills.

The first shutoff notices are going out this week.

This summer, Judge Archie Hayman judge ordered Flint to stop shutting off water service to delinquent customers. The judge found Flint illegally raised rates by 35% in 2011. As part of his ruling, the judge ordered the city to roll back the water rates and stop disconnecting people who had run up unpaid bills under the old rate structure.

But the judge's order only covered unpaid bills before September. Now those new bills, with the lower rates, are becoming past due.

"At the point where the bills were actually due, our customers will have had over two and half months past their due date to pay," says Jody Lundquist, the city of Flint's Chief Financial Officer.

Lundquist says 60% of Flint water customers are behind on their water bills. She says Flint's water revenues are down $4 million since September compared to the same time last year.

Many people in Flint stopped paying their bills to protest the city's problem-plagued water system. Others are still having trouble paying the high cost of water in Flint, which for many is still over $100 a month.

Some Flint resident also question why they should pay for water when the state and a local foundation are paying $10 million to reconnect Flint to Detroit water.

City officials point out that water bills include the cost of maintaining the system, which is a bigger part of their bill than the water.

"There is a cost to provide that and it's important that the city's able to do that," says Flint Public Works Director Howard Croft.

City officials are organizing staff to make sure there are city workers to handle both the shutoffs, and the reconnections when customers pay their overdue bills.

On a positive note, city officials say that the water flowing through Flint's system is now entirely from Detroit. Last month, Flint switched back to Detroit water after an 18-month experiment getting its drinking water from its namesake river. The Flint River proved to be difficult for city staffers to properly treat, leading to problems with taste, smell and appearance. The corrosiveness of the river also damaged pipes, creating an issue with rising lead levels in the water.

Thousands of water filters have been distributed to city residents to filter out the lead. But there are concerns the lead problem will persist for a long time. More filter giveaways are planned.

http://www.wwmt.com/news/features/state/stories/Legislators-calling-for-investigation-over-Flint-report-228582.shtml#.VjzENiuvyHI

Updated: Fri, Nov 06 2015, 08:56 AM – **Video at link**

LANSING, Mich. (NEWSCHANNEL 3) - Legislators are pushing for a federal investigation into a botched Flint report.

Two Michigan state reps, including one from Flint, are demanding an investigation after another controversial lead report.

A Michigan radio station reported the Department of Environmental Quality knowingly dropped two lead test samples to avoid exceeding a federal drinking water standard.

They're also calling on the governor to remove the director of the Department of Environmental Quality.

Meanwhile, Flint is sending out its first water shutoff notices since a judge's ruling temporarily halted the practice in August.

About 1,800 notices for past-due accounts are expected to be mailed out this week.

The notices only cover debts from water bills issued since the city decreased water and sewer rates to comply with a circuit court judge's orders.

FLINT, MI -- Two state representatives are pushing for a federal investigation into the Michigan Department of Environmental Quality (DEQ).

State Reps. Phil Phelps (D-Flushing) and Sheldon Neeley (D-Flint) are calling for the federal investigation into the DEQ, according to a news release from Phelps' office. The call for the investigation came after a Michigan Radio story was publish Thursday, Nov. 5 claiming the DEQ knowingly dropped two lead test samples to avoid exceeding a federal drinking water standards.

Neeley is also calling for DEQ Director Dan Wyant to be removed from his position by Gov. Rick Snyder. Neeley has also sent several letters to the governor and Attorney General Bill Schuette requesting they take action, but according to the release neither office has responded to the legislator.

"It is shameful and appalling to me that the men and women we entrust to keep us safe at the highest levels of state government would purposely put the health of Flint's residents at risk," Neeley said in a statement. "For the past year, the Flint community has been subjected to high levels of lead in their water. Action clearly could have been taken earlier to protect the children who have been the most at risk. This behavior borderlines on criminal activity. The governor should immediately terminate the director of the DEQ and all culpable members of the staff."

Mike Glasgow, an employee with the city of Flint who collected the water samples, was told to take a sample from Lee Anne Walter's Flint home off the report, according to the Michigan Radio story. That sample came back with a lead result of 104 parts per billion -- seven times the federally mandated limit, according to the release.

"You can read the story, and know immediately that what the DEQ is saying and what actually happened doesn't add up," Phelps said in a statement. "This is just one more instance of the DEQ covering something up, and even more of a reason they fought me when I sent a FOIA requesting information relating to the water crisis in Flint. There must be a full federal investigation into the state on how they handled these samples."

According to the release, Wyant attributed the drop of Walters' sample was because a water filter was used in the home.

FLINT, MI (WNEM) -

Berston Fieldhouse is alive with activity as pick-up games are in full swing.

It didn't take long for those running the courts to work up a sweat.

But just like many places across the city, the water fountain came with a very real warning.

"Makes you feel some type of way, it's not safe, it's not good," said basketball player Briana Mayes.

Forcing many to stick with bottled water.

"It's no telling how much we've been exposed to and how much is actually being kept from us," said resident Nafisah McClendon.

And the concerns about lead exposure in Flint's water has two local lawmakers saying they've seen enough.

"This is definitely the most negligent that I've seen at the state level," said state Rep. Phil Phelps.

Phelps is joining state Rep. Sheldon Neeley in calling for a federal investigation into the state's Department of Environmental Quality.

This all comes in the wake of Michigan Radio’s discovery that the DEQ knowingly dropped two lead samples to avoid exceeding federal drinking water guidelines.

"If they were playing by the rules from the get-go, this whole situation might not have happened at all," Phelps said.

Phelps and Neeley also want Gov. Rick Snyder to remove DEQ Director Dan Wyant from that position.

They believe he was in the lead and oversaw what they call a massive cover-up.

"If it comes out that these were deliberate cover up attempts, I don't think people only need to lose their jobs, there needs to be people sitting in jail," Phelps said.

Phelps said they’re waiting for a response from the federal government and Synder.

And as water quality continues to be a question mark in the city, there are many others also waiting.

"You wonder, from the people who have been effected, what long term effects it will have on them, and you won't know until, unfortunately, it's already happening," McClendon said.

---

http://michiganradio.org/post/feds-warn-new-threat-flint-water-may-pose-immediate-and-acute-health-hazards

By Citizen name / Ex. 6 • Nov 5, 2015

The U.S. Environmental Protection Agency says people living in Flint should be warned of the potential for “high lead release” into their tap water if road work or other physical disturbances to lead and even non-lead service lines occur.

The agency says these physical disturbances “could pose an immediate and acute health hazard” to residents.

EPA released the information late Wednesday in a report sent to Michigan’s Department of Environmental Quality and the city of Flint. It’s the finalized version of an interim report that was leaked to the ACLU over the summer.

This version of the report lays out how a combination of factors may have led to extremely high lead levels at one Flint home. It also says that similar situations could happen in the future.

Regulators say scale would have built up over time inside the distribution pipes in Flint. These scales are described as "protective" because they help prevent water from coming into contact with lead distribution pipes, and leaching lead into tap water in people's homes.

"Lead service lines are the largest source of lead, when present, and can contribute up to 75 percent of the total mass of lead released into the water," the report says.

But the scales can pose a big risk too. Over time, lead can accumulate in the scales. Even non lead service lines could be at risk.

"Studies have shown that the scales within galvanized iron pipe downstream of lead pipe segments can be 'seeded' with lead from the lead portion of the service," the report says.

The report says the corrosiveness of the Flint River water without proper treatment "are well known factors that can contribute to high lead release."

The head of Michigan's Department of Environmental Quality previously admitted it mistakenly allowed Flint to stop corrosion control treatment when it switched water sources. This week the EPA issued a memorandum to all the agency's regional directors, clarifying that water systems must study a water source to determine the best corrosion control treatment before making a switch.

Without proper corrosion control treatment, and when road work or other physical disturbances to underground pipes happens, these scales can be "dislodged" into people's tap water. The EPA says it's "reasonable to assume" that these disturbances could release lead laden scale into tap water, even if the service line is not made of lead.

At Lee Anne Walters' home, the iron service line was unusually long; at least 150 feet. The EPA believes the scale on her home's iron service line was 'seeded' with lead. The agency believes the water chemistry and a physical disturbance led to extremely high lead levels in Walters' home. The report notes two relatively new asphalt patches on the road near her home.

The lack of corrosion control treatment in Flint is now well known. But this is the first time physical disturbance has been mentioned as a big risk.

"The jarring and vibration associated with excavation can dislodge the high lead-bearing scales from with the service line pipes," the report says.

The report makes several recommendations to prevent the release of “large amounts of scale and sediment that could pose an immediate and acute health hazard to the residents.”

More data from intact pipes, lead and non-lead, need to be collected. Assessing the scales within these lines in Flint is “essential” to determine the risk to residents, the report says.

Develop training and public education on potential for “high lead release” from the scales. The report says people should know when utility work is going on and the “potential risk of increased lead levels due to these disturbances.”

VIDEO AND RA INTERVIEW

FLINT, MI (WNEM) - Arthur Woodson is one of many protesters that called for the Environmental Protection Agency to look into his city’s water crisis.

“I wasn't surprised – I am just glad that they brought it out to the open,” Woodson said.

In a detailed report released on Wednesday, the EPA laid out its findings on Flint's water problems.

It found increased lead levels in off Hemphill and Pengelly Roads near Bryant Street.

Susan Hedman is the EPA's administrator for this region.

"The U.S. Environmental Protection Agency is very concerned about lead levels in Flint," Hedman said.

Pete Hall only uses his water to wash his car as his grandson looks on. However, that's as close as he will let him get to the water.

“I'm more scared for the kids drinking it because kids when they get thirsty they going to drink the first thing available," Hall said.

Neighbors said they see no good news insight regarding the water woes of Flint, and they want to be tested.

---

http://www.detroitnews.com/story/news/politics/2015/11/05/experts-water-health-dangers-subside-flint/75255704/

Citizen name / Ex. 6, The Detroit News 11:32 p.m. EST November 5, 2015

Local health officials and the federal government are warning Flint residents that the danger from their tap water has not subsided even though the city has reconnected to Detroit's water system.

Dr. Mona Hanna-Attisha, the Hurley Medical Center pediatrician who uncovered lead exposure in city children two months ago, wants residents to continue their use of bottled water. This comes three weeks after Flint began receiving its drinking water from the Detroit Water and Sewerage Department.

For the previous 18 months, the city drew its water from the Flint River in an effort to save money. The high corrosive levels of the river water and a failure to use adequate corrosion controls led to unhealthy amounts of lead reaching residents.

In October, Flint and Detroit water officials announced Flint was back online with Detroit's water system, but cautioned it was not a quick fix.

"While the actual switch ... will happen immediately, it is expected that the thorough transition from Flint River water to Detroit water will be complete in approximately three weeks," DWSD said in a statement at the time. Along with the phosphates used by the Detroit system to control corrosion of lead in water delivery pipes, the city of Flint was expected to add measures for protection.

But Hanna-Attisha doesn't want residents taking any chances.

"Even though we've switched to DWSD, we have lost the sealed layer (protecting against) corrosion," she said. "And we've aged our infrastructure 30 years. Nobody knows when that seal will come back ...

"For our most vulnerable populations, pregnant women and infants, they should never be using tap water."

Officials with Michigan's Department of Environmental Quality agreed with Hanna-Attisha's assessment on corrosion measures, saying it has taken "up to several months" in other cities across the country. As a result, residents should try to find out exactly what is or isn't in their water.

"The only way for a homeowner to know for certain is to have their home tested," said DEQ spokesman Brad Wurfel. “DEQ and the city of Flint offer free testing for Flint residents, and we recommend concerned residents take advantage of it.”

Greg Eno, a Detroit water system spokesman, said the utility simply provides the water complete with corrosion controls. Measuring how quickly the controls reach maximum effectiveness is done by the city of Flint, which owns the pipelines, he said.

On Wednesday, U.S. Environmental Protection Agency officials issued their own warnings in a report that highlighted the lead dangers inherent in the city’s aging underground infrastructure.

“... (E)ven with corrosion control treatment in place in the future, physical disturbances will be capable of dislodging the high lead-bearing scale and sediment from non-lead pipes and well as lead pipes...,” according to the report. Such disturbances include construction work and line replacement.

Flint residents have endured problems with their water since the spring of 2014, when the city’s state-appointed emergency manager severed the relationship with the Detroit water system system. The hope was that the switch to the Flint River would help the financially troubled city save money until its new water system that draws water from Lake Huron — the Karegondi Water Authority — becomes operational in the second half of 2016.

Almost immediately after the switch, however, residents began reporting foul odors, strange tastes and cloudiness in the water coming from their taps. Local and state officials argued that testing showed the water was safe, but relented a month ago when Hanna-Attisha’s deeper dissection of the data found high levels of lead in Flint children.

“Infants and children who drink water containing lead in excess of the action level could experience delays in their physical or mental development,” according to the EPA. “Children could show slight deficits in attention span and learning abilities.”

Water safety fears led residents such as Kelly Wilson to make tough choices. The 55-year-old regularly makes the trek from her subsidized apartment building to the Family Dollar store just a block to buy water.

Wilson said she spends between $40 and $50 each month, which is difficult since the widow’s fixed income during the same period is $740.

She said she can’t afford all of the water she needs, so she puts her fears aside long enough to take showers and brush her teeth with the city water.

“I wonder when I’m showering and it gets in my pores — what is this doing to me?” Wilson said.

The lack of faith in Flint’s water isn’t surprising, Hanna-Attisha said.

“This community has been lied to, and they have no trust, no trust in government,” she added.

Critics hold the state responsible for the situation, since Gov. Rick Snyder's appointed emergency manager was in charge when the decision was made to begin drawing water from the river instead of the Detroit system's Lake Huron. Emails between state and federal officials have shown the DEQ was aware of potential problems stemming from a lack of corrosion control as early as February.

On Thursday, a pair of Democratic Flint-area state representatives called for an investigation into how DEQ handled water samples from one home in the city that showed exorbitant levels of lead early in the year. Reps. Phil Phelps of Flushing and Sheldon Neeley of Flint, responding to a Michigan Radio report, said they want to know if state officials threw out the results to keep the city from exceeding federal standards.

In October, DEQ Director Dan Wyant said staffers failed to apply the proper water quality protections as prescribed by the federal Lead and Copper Rule.

Also on Thursday, Senate Minority Leader Jim Ananich, D-Flint, renewed calls for legislative hearings on the state's failure to handle the situation properly. It would include a Senate subcommittee with subpoena powers.

"The Legislature has a unique role and responsibility in thoroughly examining what went wrong, what still needs to be fixed and how to ensure this sort of crisis never happens again," Ananich said.

Snyder appointed a five-person, bipartisan task force to review the actions of DEQ and other governmental agencies in Flint's switch to Flint River water.

State Auditor General Doug Ringle said last week his office will look into questions raised about the department's Office of Drinking Water and Municipal Assistance. Ringler's office already had an operational audit of the office underway before Ananich requested the state auditor find out what "accountability measures" are in place for DEQ staff who do not follow water testing data protocols.

In the meantime, Hanna-Attisha is recommending that those using Flint's tap water use tap filters that are being supplied for free by the city and state. The water also should be used cold, she said, since warmer temperatures cause a greater amount of leaching in lead pipes and plumbing.

Detroit News Staff Writer Chad Livengood contributed.

By Mark Brush • 23 hours ago

Tap water in a Flint hospital on Oct. 16, 2015.

The Environmental Protection Agency says it's conducting a full review of what happened in Flint.

For more than a year, state officials assured city residents their water was safe. Those assurances turned out to be wrong.

And it wasn't until some residents got outside experts involved -- who not only found elevated lead levels in the drinking water, but that blood lead levels were also rising in Flint kids – that the state admitted there was a problem.

One of the more troubling charges made against the state is that the Michigan Department of Environmental Quality knowingly dropped lead test samples to avoid exceeding a federal drinking water standard.

Curt Guyette with the ACLU of Michigan wrote about this in September:

An investigation by the ACLU of Michigan -- conducted in conjunction with the study of Flint's water by researchers at Virginia Tech and the citizen group Coalition for Clean Water -- has found that the city, operating under the oversight of the Michigan Department of Environmental Quality, took multiple actions that skewed the outcome of its tests to produce favorable results.

State officials maintain they followed the testing rules for lead under the Safe Drinking Water Act.

But others say that's just not true.

Marc Edwards is an expert on water treatment at Virginia Tech University. He said the first and most important step did not occur in Flint.

The city is supposed to test homes known to either be serviced by lead service lines, or that have lead pipes or pipes with lead solder in them.

Large water systems are supposed to test the "worst-case-scenario" homes to see if they have a problem.

That's the point of the federally-mandated Lead and Copper Rule. Large water systems are supposed to test the "worst-case-scenario" homes to see if they have a problem.

"They did not do that, and that is the primary reason that they missed the worst of the lead problem," says Edwards.

Edwards lays the blame squarely on the Michigan Department of Environmental Quality – not the city of Flint.

It was a state-appointed emergency manager who made the decision to switch the city's source of drinking water to save money.

And it was the state's responsibility to make sure that Flint was managing that switch correctly.

An altered report

"Even though they didn't sample the highest risk homes in the samples collected by the city, they were still over the action level. So MDEQ, and I've never seen this in 25 years, took the initial report that the city gave and altered it," says Edwards.

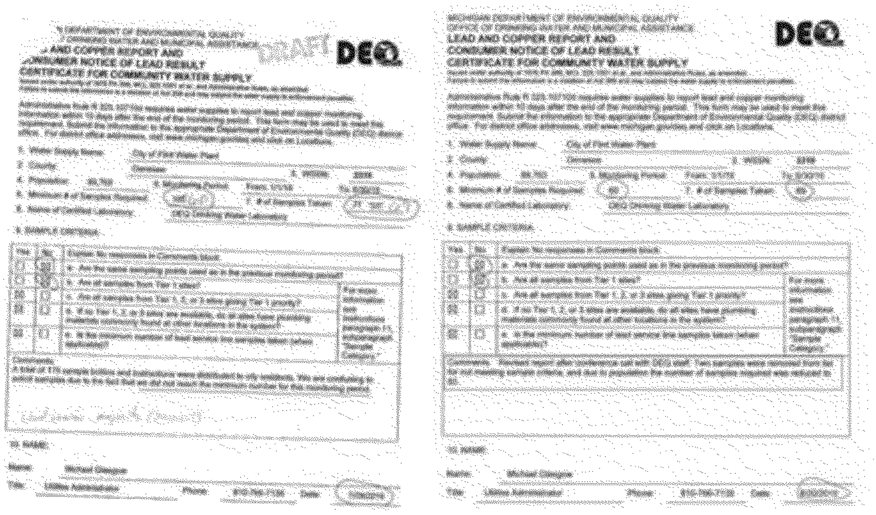
Edwards and the ACLU of Michigan obtained internal documents that showed the city originally submitted 71 drinking water samples to the state in July.

We did the math on those samples using the federal lead and copper rule. This original sample pool of 71 put the city over the federally mandated action level of 15 parts per billion of lead.

The city would have had to alert people that there was a lead problem, and they would have had to implement a corrosion control plan to keep the water from corroding the insides of pipes – a plan that was surprisingly absent in Flint. And they may have been required to start replacing lead service lines in the city.

This is all an expensive proposition in a city that made the switch to save money.

But that never happened.



The two reports side by side. The "draft" report shows the original number of samples taken in Flint. The final report shows two samples were dropped.

Credit Flintwaterstudy.org

State officials came back and told the city to drop two samples.

Dropping those two samples put the city below the action level for lead. If the state had just dropped one high sample, Flint still would have been over the federal action level.

But dropping two samples put them below the action level.

To see exactly how this math works, check out this post.

The samples in question

Mike Glasgow is with the city of Flint. He's the guy in charge of collecting the water samples.

Glasgow remembers including samples taken at one home that showed extremely high lead levels. A sample of Lee Anne Walters' home turned up a result of 104 parts per billion – almost seven times the federally mandated limit.

"I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report."

“They instructed me to take it off the report,” says Glasgow. “I know she had taken some other samples and they had all the results too. I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report.”

The state denies any wrongdoing.

Dan Wyant is the director of the Michigan Department of Environmental Quality.

“What you’re suggesting is somehow that we dropped two tests purposely, and I can say we’ve gone back and looked at this,” says Wyant. “And so we’ve asked somebody in our laboratory. When the test comes in that doesn’t meet the protocol definition, they drop that test by definition alone, and so the reality is that’s how that sample got dropped.”

State officials say a sample from one home was dropped because there was a water filter. Homes with water filters are excluded because they might give a low result.

But the test result that was dropped –- the result from Lee Anne Walters home -- was the highest test result in the 2015 sampling pool: 104 parts per billion.

The second sample that was dropped showed 20 parts per billion of lead. The state says that sample was dropped because federal rules state that a sample can’t come from a business. It has to come from a home.

Spirit of the rule not followed?

So state officials say they made Flint drop test results because those samples didn’t follow guidelines.

But the guidelines for all the samples weren’t followed in the first place.

Federal rules say you must test the “worst-case-scenario” homes – the homes connected to pipes with lead in them. But the city didn’t do that.

Elin Betanzo is a water quality expert with the Northeast-Midwest Institute. She worked in the EPA’s drinking water office for eight years.

She says the rules say if a site is sampled – even if it’s not technically supposed to be in the sampling pool – the results should still be used to determine if the water supply is safe.

“If they did find high lead levels, that’s high lead levels in the water system. And the whole point of the rule is to be protective of public health for everyone consuming that water," Betanzo says. "So if one unplanned home is having high lead levels, that should factor into the compliance calculation.”

Marc Edwards says there are a lot of ways water utilities can "game" the lead and copper rule to try to turn up favorable results. In 2009, his team put out a white paper showing what he calls a list of "cheating strategies" used to get around the spirit of the lead and copper rule.

There are a lot of people looking into what was done in Flint. Governor Snyder appointed a panel to conduct a review. And EPA officials say they hope to share the results of their review sometime next week.

LANSING, MI — Senate Minority Leader Jim Ananich on Thursday formally requested legislative hearings on the Flint water crisis and response by the Michigan Department of Environmental Quality.

"In the handling of the Flint water case, failures at multiple levels of government led to my community — and particularly its children — being poisoned," Ananich said in a letter to Senate Majority Leader Arlan Meekhof, referencing high lead levels found after a switch to Flint River drinking water.

"We need to make sure that the executive branch is faithfully executing the laws passed by this body and protecting all Michigan taxpayers by making sure the $9.35 million in state funds appropriated for the Flint water crisis are used correctly."

Gov. Rick Snyder has already appointed a task force to review the Flint water crisis. The federal Environmental Protection Agency is also investigating, and the state Auditor General recently agreed to expand an ongoing audit of MDEQ's drinking water division.

But Ananich, in his letter, noted that the task force lacks subpoena power that a Senate committee could use to compel testimony. He pointed out that none of the state or federal probes will require sworn testimony and highlighted a common characteristic: "a branch of government or agency is investigating themselves."

The Flint Democrat proposed a series of six legislative hearings by the end of the year "in an appropriate" Senate committee, such as the newly formed Oversight panel.

Meekhof, R-West Olive, did not sound immediately enthused by Ananich's proposal and does not appear prepared to call for hearings any time soon.

"He and I have been talking about that, but I'd like the folks that are in charge of gathering data and information to do that," Meekhof said, noting that the Senate could have a busy couple months with energy and Detroit education legislation in the pipeline.

Meekhof also offered support for MDEQ Director Dan Wyant, who has faced criticism over his department's handling of the water crisis.

"I believe they will find solutions and they will find the thing that need to be corrected," Meekhof said. "I have very high confidence in the director."

Flint began drawing drinking water from the Flint River in April of 2014, while the city was under control of a state-appointed emergency manager. City Council had previously approved a long-term plan to move off Detroit water and join the new Karegnondi Water Authority but did not vote on using river water in the interim.

Wyant recently replaced the head of the Office of Drinking Water and Municipal Assistance, acknowledging that the state had enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make it less corrosive.

Ananich said public hearings in a legislative committee would further help the public understand the crisis and help the state or other cities avoid similar problems in the future.

"The solution is going to be ongoing when it comes to helping these kids that have brain damage because of the lead," he told reporters after session. "But I think this helps get some accountability. I think citizens deserve that. I think taxpayers deserve that. This could be one way to do it."

http://michiganradio.org/post/flint-restart-water-shutoffs

By Steve Carmody • 19 hours ago

Beginning next month, the city of Flint plans to again disconnect water customers who aren’t paying their bills.

The first shutoff notices are going out this week.

This summer, Judge Archie Hayman judge ordered Flint to stop shutting off water service to delinquent customers. The judge found Flint illegally raised rates by 35% in 2011. As part of his ruling, the judge ordered the city to roll back the water rates and stop disconnecting people who had run up unpaid bills under the old rate structure.

But the judge's order only covered unpaid bills before September. Now those new bills, with the lower rates, are becoming past due.

"At the point where the bills were actually due, our customers will have had over two and half months past their due date to pay," says Jody Lundquist, the city of Flint's Chief Financial Officer.

Lundquist says 60% of Flint water customers are behind on their water bills. She says Flint's water revenues are down $4 million since September compared to the same time last year.

Many people in Flint stopped paying their bills to protest the city's problem-plagued water system. Others are still having trouble paying the high cost of water in Flint, which for many is still over $100 a month.

Some Flint resident also question why they should pay for water when the state and a local foundation are paying $10 million to reconnect Flint to Detroit water.

City officials point out that water bills include the cost of maintaining the system, which is a bigger part of their bill than the water.

"There is a cost to provide that and it's important that the city's able to do that," says Flint Public Works Director Howard Croft.

City officials are organizing staff to make sure there are city workers to handle both the shutoffs, and the reconnections when customers pay their overdue bills.

On a positive note, city officials say that the water flowing through Flint's system is now entirely from Detroit. Last month, Flint switched back to Detroit water after an 18-month experiment getting its drinking water from its namesake river. The Flint River proved to be difficult for city staffers to properly treat, leading to problems with taste, smell and appearance. The corrosiveness of the river also damaged pipes, creating an issue with rising lead levels in the water.

Thousands of water filters have been distributed to city residents to filter out the lead. But there are concerns the lead problem will persist for a long time. More filter giveaways are planned.

http://www.wwmt.com/news/features/state/stories/Legislators-calling-for-investigation-over-Flint-report-228582.shtml#.VjzENiuvyHI

Updated: Fri, Nov 06 2015, 08:56 AM – **Video at link**

LANSING, Mich. (NEWSCHANNEL 3) - Legislators are pushing for a federal investigation into a botched Flint report.

Two Michigan state reps, including one from Flint, are demanding an investigation after another controversial lead report.

A Michigan radio station reported the Department of Environmental Quality knowingly dropped two lead test samples to avoid exceeding a federal drinking water standard.

They're also calling on the governor to remove the director of the Department of Environmental Quality.

Meanwhile, Flint is sending out its first water shutoff notices since a judge's ruling temporarily halted the practice in August.

About 1,800 notices for past-due accounts are expected to be mailed out this week.

The notices only cover debts from water bills issued since the city decreased water and sewer rates to comply with a circuit court judge's orders.

By Amanda Emery | aemery@mlive.com
on November 05, 2015 at 7:02 PM, updated November 05, 2015 at 7:17 PM

FLINT, MI -- Two state representatives are pushing for a federal investigation into the Michigan Department of Environmental Quality (DEQ).

State Reps. Phil Phelps (D-Flushing) and Sheldon Neeley (D-Flint) are calling for the federal investigation into the DEQ, according to a news release from Phelps' office. The call for the investigation came after a Michigan Radio story was publish Thursday, Nov. 5 claiming the DEQ knowingly dropped two lead test samples to avoid exceeding a federal drinking water standards.

Neeley is also calling for DEQ Director Dan Wyant to be removed from his position by Gov. Rick Snyder. Neeley has also sent several letters to the governor and Attorney General Bill Schuette requesting they take action, but according to the release neither office has responded to the legislator.

"It is shameful and appalling to me that the men and women we entrust to keep us safe at the highest levels of state government would purposely put the health of Flint's residents at risk," Neeley said in a statement. "For the past year, the Flint community has been subjected to high levels of lead in their water. Action clearly could have been taken earlier to protect the children who have been the most at risk. This behavior borderlines on criminal activity. The governor should immediately terminate the director of the DEQ and all culpable members of the staff."

Mike Glasgow, an employee with the city of Flint who collected the water samples, was told to take a sample from Lee Anne Walter's Flint home off the report, according to the Michigan Radio story. That sample came back with a lead result of 104 parts per billion -- seven times the federally mandated limit, according to the release.

"You can read the story, and know immediately that what the DEQ is saying and what actually happened doesn't add up," Phelps said in a statement. "This is just one more instance of the DEQ covering something up, and even more of a reason they fought me when I sent a FOIA requesting information relating to the water crisis in Flint. There must be a full federal investigation into the state on how they handled these samples."

According to the release, Wyant attributed the drop of Walters' sample was because a water filter was used in the home.

FLINT, MI (WNEM) -

Berston Fieldhouse is alive with activity as pick-up games are in full swing.

It didn't take long for those running the courts to work up a sweat.

But just like many places across the city, the water fountain came with a very real warning.

"Makes you feel some type of way, it's not safe, it's not good," said basketball player Briana Mayes.

Forcing many to stick with bottled water.

"It's no telling how much we've been exposed to and how much is actually being kept from us," said resident Nafisah McClendon.

And the concerns about lead exposure in Flint's water has two local lawmakers saying they've seen enough.

"This is definitely the most negligent that I've seen at the state level," said state Rep. Phil Phelps.

Phelps is joining state Rep. Sheldon Neeley in calling for a federal investigation into the state's Department of Environmental Quality.

This all comes in the wake of Michigan Radio’s discovery that the DEQ knowingly dropped two lead samples to avoid exceeding federal drinking water guidelines.

"If they were playing by the rules from the get-go, this whole situation might not have happened at all," Phelps said.

Phelps and Neeley also want Gov. Rick Snyder to remove DEQ Director Dan Wyant from that position.

They believe he was in the lead and oversaw what they call a massive cover-up.

"If it comes out that these were deliberate cover up attempts, I don't think people only need to lose their jobs, there needs to be people sitting in jail," Phelps said.

Phelps said they’re waiting for a response from the federal government and Synder.

And as water quality continues to be a question mark in the city, there are many others also waiting.

"You wonder, from the people who have been effected, what long term effects it will have on them, and you won't know until, unfortunately, it's already happening," McClendon said.

http://michiganradio.org/post/feds-warn-new-threat-flint-water-may-pose-immediate-and-acute-health-hazards

By Lindsey Smith • Nov 5, 2015

The U.S. Environmental Protection Agency says people living in Flint should be warned of the potential for "high lead release" into their tap water if road work or other physical disturbances to lead and even non-lead service lines occur.

The agency says these physical disturbances "could pose an immediate and acute health hazard" to residents.

EPA released the information late Wednesday in a report sent to Michigan's Department of Environmental Quality and the city of Flint. It's the finalized version of an interim report that was leaked to the ACLU over the summer.

This version of the report lays out how a combination of factors may have led to extremely high lead levels at one Flint home. It also says that similar situations could happen in the future.

Regulators say scale would have built up over time inside the distribution pipes in Flint. These scales are described as "protective" because they help prevent water from coming into contact with lead distribution pipes, and leaching lead into tap water in people's homes.

"Lead service lines are the largest source of lead, when present, and can contribute up to 75 percent of the total mass of lead released into the water," the report says.

But the scales can pose a big risk too. Over time, lead can accumulate in the scales. Even non lead service lines could be at risk.

"Studies have shown that the scales within galvanized iron pipe downstream of lead pipe segments can be 'seeded' with lead from the lead portion of the service," the report says.

The report says the corrosiveness of the Flint River water without proper treatment "are well known factors that can contribute to high lead release."

The head of Michigan's Department of Environmental Quality previously admitted it mistakenly allowed Flint to stop corrosion control treatment when it switched water sources. This week the EPA issued a memorandum to all the agency's regional directors, clarifying that water systems must study a water source to determine the best corrosion control treatment before making a switch.

Without proper corrosion control treatment, and when road work or other physical disturbances to underground pipes happens, these scales can be “dislodged” into people’s tap water. The EPA says it’s “reasonable to assume” that these disturbances could release lead laden scale into tap water, even if the service line is not made of lead.

At Lee Anne Walters’ home, the iron service line was unusually long; at least 150 feet. The EPA believes the scale on her home’s iron service line was ‘seeded’ with lead. The agency believes the water chemistry and a physical disturbance led to extremely high lead levels in Walters’ home. The report notes two relatively new asphalt patches on the road near her home.

The lack of corrosion control treatment in Flint is now well known. But this is the first time physical disturbance has been mentioned as a big risk.

“The jarring and vibration associated with excavation can dislodge the high lead-bearing scales from with the service line pipes,” the report says.

The report makes several recommendations to prevent the release of “large amounts of scale and sediment that could pose an immediate and acute health hazard to the residents.”

More data from intact pipes, lead and non-lead, need to be collected. Assessing the scales within these lines in Flint is “essential” to determine the risk to residents, the report says.

Develop training and public education on potential for “high lead release” from the scales. The report says people should know when utility work is going on and the “potential risk of increased lead levels due to these disturbances.”

VIDEO AND RA INTERVIEW

FLINT, MI (WNEM) - Arthur Woodson is one of many protesters that called for the Environmental Protection Agency to look into his city’s water crisis.

“I wasn't surprised – I am just glad that they brought it out to the open,” Woodson said.

In a detailed report released on Wednesday, the EPA laid out its findings on Flint's water problems.

It found increased lead levels in off Hemphill and Pengelly Roads near Bryant Street.

Susan Hedman is the EPA's administrator for this region.

"The U.S. Environmental Protection Agency is very concerned about lead levels in Flint," Hedman said.

Pete Hall only uses his water to wash his car as his grandson looks on. However, that's as close as he will let him get to the water.

“I'm more scared for the kids drinking it because kids when they get thirsty they going to drink the first thing available," Hall said.

Neighbors said they see no good news insight regarding the water woes of Flint, and they want to be tested.

---

http://www.detroitnews.com/story/news/politics/2015/11/05/experts-water-health-dangers-subside-flint/75255704/

Jim Lynch, The Detroit News 11:32 p.m. EST November 5, 2015

Local health officials and the federal government are warning Flint residents that the danger from their tap water has not subsided even though the city has reconnected to Detroit’s water system.

Dr. Mona Hanna-Attisha, the Hurley Medical Center pediatrician who uncovered lead exposure in city children two months ago, wants residents to continue their use of bottled water. This comes three weeks after Flint began receiving its drinking water from the Detroit Water and Sewerage Department.

For the previous 18 months, the city drew its water from the Flint River in an effort to save money. The high corrosive levels of the river water and a failure to use adequate corrosion controls led to unhealthy amounts of lead reaching residents.

In October, Flint and Detroit water officials announced Flint was back online with Detroit’s water system, but cautioned it was not a quick fix.

“While the actual switch ... will happen immediately, it is expected that the thorough transition from Flint River water to Detroit water will be complete in approximately three weeks,” DWSD said in a statement at the time. Along with the phosphates used by the Detroit system to control corrosion of lead in water delivery pipes, the city of Flint was expected to add measures for protection.

But Hanna-Attisha doesn’t want residents taking any chances.

“Even though we’ve switched to DWSD, we have lost the sealed layer (protecting against) corrosion,” she said. “And we’ve aged our infrastructure 30 years. Nobody knows when that seal will come back ...

“For our most vulnerable populations, pregnant women and infants, they should never be using tap water.”

Officials with Michigan’s Department of Environmental Quality agreed with Hanna-Attisha’s assessment on corrosion measures, saying it has taken “up to several months” in other cities across the country. As a result, residents should try to find out exactly what is or isn’t in their water.

“The only way for a homeowner to know for certain is to have their home tested,” said DEQ spokesman Brad Wurfel. “DEQ and the city of Flint offer free testing for Flint residents, and we recommend concerned residents take advantage of it.”

Greg Eno, a Detroit water system spokesman, said the utility simply provides the water complete with corrosion controls. Measuring how quickly the controls reach maximum effectiveness is done by the city of Flint, which owns the pipelines, he said.

On Wednesday, U.S. Environmental Protection Agency officials issued their own warnings in a report that highlighted the lead dangers inherent in the city’s aging underground infrastructure.

“... (E)ven with corrosion control treatment in place in the future, physical disturbances will be capable of dislodging the high lead-bearing scale and sediment from non-lead pipes and well as lead pipes...,” according to the report. Such disturbances include construction work and line replacement.

Flint residents have endured problems with their water since the spring of 2014, when the city’s state-appointed emergency manager severed the relationship with the Detroit water system system. The hope was that the switch to the Flint River would help the financially troubled city save money until its new water system that draws water from Lake Huron — the Karegondi Water Authority — becomes operational in the second half of 2016.

Almost immediately after the switch, however, residents began reporting foul odors, strange tastes and cloudiness in the water coming from their taps. Local and state officials argued that testing showed the water was safe, but relented a month ago when Hanna-Attisha’s deeper dissection of the data found high levels of lead in Flint children.

“Infants and children who drink water containing lead in excess of the action level could experience delays in their physical or mental development,” according to the EPA. “Children could show slight deficits in attention span and learning abilities.”

Water safety fears led residents such as Kelly Wilson to make tough choices. The 55-year-old regularly makes the trek from her subsidized apartment building to the Family Dollar store just a block to buy water.

Wilson said she spends between $40 and $50 each month, which is difficult since the widow’s fixed income during the same period is $740.

She said she can’t afford all of the water she needs, so she puts her fears aside long enough to take showers and brush her teeth with the city water.

“I wonder when I’m showering and it gets in my pores — what is this doing to me?” Wilson said.

The lack of faith in Flint’s water isn’t surprising, Hanna-Attisha said.

“This community has been lied to, and they have no trust, no trust in government,” she added.

Critics hold the state responsible for the situation, since Gov. Rick Snyder’s appointed emergency manager was in charge when the decision was made to begin drawing water from the river instead of the Detroit system’s Lake Huron. Emails between state and federal officials have shown the DEQ was aware of potential problems stemming from a lack of corrosion control as early as February.

On Thursday, a pair of Democratic Flint-area state representatives called for an investigation into how DEQ handled water samples from one home in the city that showed exorbitant levels of lead early in the year. Reps. Phil Phelps of Flushing and Sheldon Neeley of Flint, responding to a Michigan Radio report, said they want to know if state officials threw out the results to keep the city from exceeding federal standards.

In October, DEQ Director Dan Wyant said staffers failed to apply the proper water quality protections as prescribed by the federal Lead and Copper Rule.

Also on Thursday, Senate Minority Leader Jim Ananich, D-Flint, renewed calls for legislative hearings on the state’s failure to handle the situation properly. It would include a Senate subcommittee with subpoena powers.

“The Legislature has a unique role and responsibility in thoroughly examining what went wrong, what still needs to be fixed and how to ensure this sort of crisis never happens again,” Ananich said.

Snyder appointed a five-person, bipartisan task force to review the actions of DEQ and other governmental agencies in Flint's switch to Flint River water.

State Auditor General Doug Ringle said last week his office will look into questions raised about the department's Office of Drinking Water and Municipal Assistance. Ringler's office already had an operational audit of the office underway before Ananich requested the state auditor find out what "accountability measures" are in place for DEQ staff who do not follow water testing data protocols.

In the meantime, Hanna-Attisha is recommending that those using Flint's tap water use tap filters that are being supplied for free by the city and state. The water also should be used cold, she said, since warmer temperatures cause a greater amount of leaching in lead pipes and plumbing.

<image002.jpg>Tap water in a Flint hospital on Oct. 16, 2015.

The Environmental Protection Agency says it's conducting a full review of what happened in Flint.

For more than a year, state officials assured city residents their water was safe. Those assurances turned out to be wrong.

And it wasn't until some residents got outside experts involved -- who not only found elevated lead levels in the drinking water, but that blood lead levels were also rising in Flint kids – that the state admitted there was a problem.

One of the more troubling charges made against the state is that the Michigan Department of Environmental Quality knowingly dropped lead test samples to avoid exceeding a federal drinking water standard.

Curt Guyette with the ACLU of Michigan wrote about this in September:

An investigation by the ACLU of Michigan -- conducted in conjunction with the study of Flint's water by researchers at Virginia Tech and the citizen group Coalition for Clean Water -- has found that the city, operating under the oversight of the Michigan Department of Environmental Quality, took multiple actions that skewed the outcome of its tests to produce favorable results.

State officials maintain they followed the testing rules for lead under the Safe Drinking Water Act.

But others say that’s just not true.

Marc Edwards is an expert on water treatment at Virginia Tech University. He said the first and most important step did not occur in Flint.

The city is supposed to test homes known to either be serviced by lead service lines, or that have lead pipes or pipes with lead solder in them.

Large water systems are supposed to test the "worst-case-scenario" homes to see if they have a problem.

That’s the point of the federally-mandated Lead and Copper Rule. Large water systems are supposed to test the “worst-case-scenario” homes to see if they have a problem.

“They did not do that, and that is the primary reason that they missed the worst of the lead problem,” says Edwards.

Edwards lays the blame squarely on the Michigan Department of Environmental Quality – not the city of Flint.

It was a state-appointed emergency manager who made the decision to switch the city’s source of drinking water to save money.

And it was the state’s responsibility to make sure that Flint was managing that switch correctly.

An altered report

“Even though they didn’t sample the highest risk homes in the samples collected by the city, they were still over the action level. So MDEQ, and I’ve never seen this in 25 years, took the initial report that the city gave and altered it,” says Edwards.

Edwards and the ACLU of Michigan obtained internal documents that showed the city originally submitted 71 drinking water samples to the state in July.

We did the math on those samples using the federal lead and copper rule. This original sample pool of 71 put the city over the federally mandated action level of 15 parts per billion of lead.

The city would have had to alert people that there was a lead problem, and they would have had to implement a corrosion control plan to keep the water from corroding the insides of pipes – a plan that was surprisingly absent in Flint. And they may have been required to start replacing lead service lines in the city.

This is all an expensive proposition in a city that made the switch to save money.

But that never happened.

<image006.jpg>

The two reports side by side. The "draft" report shows the original number of samples taken in Flint. The final report shows two samples were dropped.

Credit Flintwaterstudy.org

State officials came back and told the city to drop two samples.

Dropping those two samples put the city below the action level for lead. If the state had just dropped one high sample, Flint still would have been over the federal action level.

But dropping two samples put them below the action level.

To see exactly how this math works, check out this post.

The samples in question

Mike Glasgow is with the city of Flint. He's the guy in charge of collecting the water samples.

Glasgow remembers including samples taken at one home that showed extremely high lead levels. A sample of Lee Anne Walters' home turned up a result of 104 parts per billion – almost seven times the federally mandated limit.

"I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report."

“They instructed me to take it off the report,” says Glasgow. “I know she had taken some other samples and they had all the results too. I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report.”

The state denies any wrongdoing.

Dan Wyant is the director of the Michigan Department of Environmental Quality.

“What you’re suggesting is somehow that we dropped two tests purposely, and I can say we’ve gone back and looked at this,” says Wyant. “And so we’ve asked somebody in our laboratory. When the test comes in that doesn’t meet the protocol definition, they drop that test by definition alone, and so the reality is that’s how that sample got dropped.”

State officials say a sample from one home was dropped because there was a water filter. Homes with water filters are excluded because they might give a low result.

But the test result that was dropped –- the result from Lee Anne Walters home -- was the highest test result in the 2015 sampling pool: 104 parts per billion.

The second sample that was dropped showed 20 parts per billion of lead. The state says that sample was dropped because federal rules state that a sample can’t come from a business. It has to come from a home.

Spirit of the rule not followed?

So state officials say they made Flint drop test results because those samples didn’t follow guidelines.

But the guidelines for all the samples weren’t followed in the first place.

Federal rules say you must test the “worst-case-scenario” homes – the homes connected to pipes with lead in them. But the city didn’t do that.

Elin Betanzo is a water quality expert with the Northeast-Midwest Institute. She worked in the EPA’s drinking water office for eight years.

She says the rules say if a site is sampled – even if it’s not technically supposed to be in the sampling pool – the results should still be used to determine if the water supply is safe.

“If they did find high lead levels, that’s high lead levels in the water system. And the whole point of the rule is to be protective of public health for everyone consuming that water," Betanzo says. "So if one unplanned home is having high lead levels, that should factor into the compliance calculation.”

Marc Edwards says there are a lot of ways water utilities can "game" the lead and copper rule to try to turn up favorable results. In 2009, his team put out a white paper showing what he calls a list of "cheating strategies" used to get around the spirit of the lead and copper rule.

There are a lot of people looking into what was done in Flint. Governor Snyder appointed a panel to conduct a review. And EPA officials say they hope to share the results of their review sometime next week.

LANSING, MI — Senate Minority Leader Jim Ananich on Thursday formally requested legislative hearings on the Flint water crisis and response by the Michigan Department of Environmental Quality.

"In the handling of the Flint water case, failures at multiple levels of government led to my community — and particularly its children — being poisoned," Ananich said in a letter to Senate Majority Leader Arlan Meekhof, referencing high lead levels found after a switch to Flint River drinking water.

"We need to make sure that the executive branch is faithfully executing the laws passed by this body and protecting all Michigan taxpayers by making sure the $9.35 million in state funds appropriated for the Flint water crisis are used correctly."

Gov. Rick Snyder has already appointed a task force to review the Flint water crisis. The federal Environmental Protection Agency is also investigating, and the state Auditor General recently agreed to expand an ongoing audit of MDEQ's drinking water division.

But Ananich, in his letter, noted that the task force lacks subpoena power that a Senate committee could use to compel testimony. He pointed out that none of the state or federal probes will require sworn testimony and highlighted a common characteristic: "a branch of government or agency is investigating themselves."

The Flint Democrat proposed a series of six legislative hearings by the end of the year "in an appropriate" Senate committee, such as the newly formed Oversight panel.

Meekhof, R-West Olive, did not sound immediately enthused by Ananich's proposal and does not appear prepared to call for hearings any time soon.

"He and I have been talking about that, but I'd like the folks that are in charge of gathering data and information to do that," Meekhof said, noting that the Senate could have a busy couple months with energy and Detroit education legislation in the pipeline.

Meekhof also offered support for MDEQ Director Dan Wyant, who has faced criticism over his department's handling of the water crisis.

"I believe they will find solutions and they will find the thing that need to be corrected," Meekhof said. "I have very high confidence in the director."

Flint began drawing drinking water from the Flint River in April of 2014, while the city was under control of a state-appointed emergency manager. City Council had previously approved a long-term plan to move off Detroit water and join the new Karegnondi Water Authority but did not vote on using river water in the interim.

Wyant recently replaced the head of the Office of Drinking Water and Municipal Assistance, acknowledging that the state had enforced the wrong federal standards for treating Flint River water for more than 17 months, failing to require that the city make it less corrosive.

Ananich said public hearings in a legislative committee would further help the public understand the crisis and help the state or other cities avoid similar problems in the future.

"The solution is going to be ongoing when it comes to helping these kids that have brain damage because of the lead," he told reporters after session. "But I think this helps get some accountability. I think citizens deserve that. I think taxpayers deserve that. This could be one way to do it."

http://michiganradio.org/post/flint-restart-water-shutoffs

By Steve Carmody • 19 hours ago

Beginning next month, the city of Flint plans to again disconnect water customers who aren't paying their bills.

The first shutoff notices are going out this week.

This summer, Judge Archie Hayman judge ordered Flint to stop shutting off water service to delinquent customers. The judge found Flint illegally raised rates by 35% in 2011. As part of his ruling, the judge ordered the city to roll back the water rates and stop disconnecting people who had run up unpaid bills under the old rate structure.

But the judge's order only covered unpaid bills before September. Now those new bills, with the lower rates, are becoming past due.

"At the point where the bills were actually due, our customers will have had over two and half months past their due date to pay," says Jody Lundquist, the city of Flint's Chief Financial Officer.

Lundquist says 60% of Flint water customers are behind on their water bills. She says Flint's water revenues are down $4 million since September compared to the same time last year.

Many people in Flint stopped paying their bills to protest the city's problem-plagued water system. Others are still having trouble paying the high cost of water in Flint, which for many is still over $100 a month.

Some Flint resident also question why they should pay for water when the state and a local foundation are paying $10 million to reconnect Flint to Detroit water.

City officials point out that water bills include the cost of maintaining the system, which is a bigger part of their bill than the water.

"There is a cost to provide that and it's important that the city's able to do that," says Flint Public Works Director Howard Croft.

City officials are organizing staff to make sure there are city workers to handle both the shutoffs, and the reconnections when customers pay their overdue bills.

On a positive note, city officials say that the water flowing through Flint's system is now entirely from Detroit. Last month, Flint switched back to Detroit water after an 18-month experiment getting its drinking water from its namesake river. The Flint River proved to be difficult for city staffers to properly treat, leading to problems with taste, smell and appearance. The corrosiveness of the river also damaged pipes, creating an issue with rising lead levels in the water.

Thousands of water filters have been distributed to city residents to filter out the lead. But there are concerns the lead problem will persist for a long time. More filter giveaways are planned.

http://www.wwmt.com/news/features/state/stories/Legislators-calling-for-investigation-over-Flint-report-228582.shtml#.VjzENiuvyHI

Updated: Fri, Nov 06 2015, 08:56 AM – **Video at link**

LANSING, Mich. (NEWSCHANNEL 3) - Legislators are pushing for a federal investigation into a botched Flint report.

Two Michigan state reps, including one from Flint, are demanding an investigation after another controversial lead report.

A Michigan radio station reported the Department of Environmental Quality knowingly dropped two lead test samples to avoid exceeding a federal drinking water standard.

They're also calling on the governor to remove the director of the Department of Environmental Quality.

Meanwhile, Flint is sending out its first water shutoff notices since a judge's ruling temporarily halted the practice in August.

About 1,800 notices for past-due accounts are expected to be mailed out this week.

The notices only cover debts from water bills issued since the city decreased water and sewer rates to comply with a circuit court judge's orders.

FLINT, MI -- Two state representatives are pushing for a federal investigation into the Michigan Department of Environmental Quality (DEQ).

State Reps. Phil Phelps (D-Flushing) and Sheldon Neeley (D-Flint) are calling for the federal investigation into the DEQ, according to a news release from Phelps' office. The call for the investigation came after a Michigan Radio story was publish Thursday, Nov. 5 claiming the DEQ knowingly dropped two lead test samples to avoid exceeding a federal drinking water standards.

Neeley is also calling for DEQ Director Dan Wyant to be removed from his position by Gov. Rick Snyder. Neeley has also sent several letters to the governor and Attorney General Bill Schuette requesting they take action, but according to the release neither office has responded to the legislator.

"It is shameful and appalling to me that the men and women we entrust to keep us safe at the highest levels of state government would purposely put the health of Flint's residents at risk," Neeley said in a statement. "For the past year, the Flint community has been subjected to high levels of lead in their water. Action clearly could have been taken earlier to protect the children who have been the most at risk. This behavior borderlines on criminal activity. The governor should immediately terminate the director of the DEQ and all culpable members of the staff."

Mike Glasgow, an employee with the city of Flint who collected the water samples, was told to take a sample from Lee Anne Walter's Flint home off the report, according to the Michigan Radio story. That sample came back with a lead result of 104 parts per billion -- seven times the federally mandated limit, according to the release.

"You can read the story, and know immediately that what the DEQ is saying and what actually happened doesn't add up," Phelps said in a statement. "This is just one more instance of the DEQ covering something up, and even more of a reason they fought me when I sent a FOIA requesting information relating to the water crisis in Flint. There must be a full federal investigation into the state on how they handled these samples."

According to the release, Wyant attributed the drop of Walters' sample was because a water filter was used in the home.

FLINT, MI (WNEM) -

Berston Fieldhouse is alive with activity as pick-up games are in full swing.

It didn't take long for those running the courts to work up a sweat.

But just like many places across the city, the water fountain came with a very real warning.

"Makes you feel some type of way, it's not safe, it's not good," said basketball player Briana Mayes.

Forcing many to stick with bottled water.

"It's no telling how much we've been exposed to and how much is actually being kept from us," said resident Nafisah McClendon.

And the concerns about lead exposure in Flint's water has two local lawmakers saying they've seen enough.

"This is definitely the most negligent that I've seen at the state level," said state Rep. Phil Phelps.

Phelps is joining state Rep. Sheldon Neeley in calling for a federal investigation into the state's Department of Environmental Quality.

This all comes in the wake of Michigan Radio’s discovery that the DEQ knowingly dropped two lead samples to avoid exceeding federal drinking water guidelines.

"If they were playing by the rules from the get-go, this whole situation might not have happened at all," Phelps said.

Phelps and Neeley also want Gov. Rick Snyder to remove DEQ Director Dan Wyant from that position.

They believe he was in the lead and oversaw what they call a massive cover-up.

"If it comes out that these were deliberate cover up attempts, I don't think people only need to lose their jobs, there needs to be people sitting in jail," Phelps said.

Phelps said they're waiting for a response from the federal government and Synder.

And as water quality continues to be a question mark in the city, there are many others also waiting.

"You wonder, from the people who have been effected, what long term effects it will have on them, and you won't know until, unfortunately, it's already happening," McClendon said.

http://michiganradio.org/post/feds-warn-new-threat-flint-water-may-pose-immediate-and-acute-health-hazards

By Lindsey Smith • Nov 5, 2015

The U.S. Environmental Protection Agency says people living in Flint should be warned of the potential for "high lead release" into their tap water if road work or other physical disturbances to lead and even non-lead service lines occur.

The agency says these physical disturbances "could pose an immediate and acute health hazard" to residents.

EPA released the information late Wednesday in a report sent to Michigan's Department of Environmental Quality and the city of Flint. It's the finalized version of an interim report that was leaked to the ACLU over the summer.

This version of the report lays out how a combination of factors may have led to extremely high lead levels at one Flint home. It also says that similar situations could happen in the future.

Regulators say scale would have built up over time inside the distribution pipes in Flint. These scales are described as "protective" because they help prevent water from coming into contact with lead distribution pipes, and leaching lead into tap water in people's homes.

“Lead service lines are the largest source of lead, when present, and can contribute up to 75 percent of the total mass of lead released into the water,” the report says.

But the scales can pose a big risk too. Over time, lead can accumulate in the scales. Even non lead service lines could be at risk.

“Studies have shown that the scales within galvanized iron pipe downstream of lead pipe segments can be ‘seeded’ with lead from the lead portion of the service,” the report says.

The report says the corrosiveness of the Flint River water without proper treatment “are well known factors that can contribute to high lead release.”

The head of Michigan’s Department of Environmental Quality previously admitted it mistakenly allowed Flint to stop corrosion control treatment when it switched water sources. This week the EPA issued a memorandum to all the agency’s regional directors, clarifying that water systems must study a water source to determine the best corrosion control treatment before making a switch.

Without proper corrosion control treatment, and when road work or other physical disturbances to underground pipes happens, these scales can be “dislodged” into people’s tap water. The EPA says it’s “reasonable to assume” that these disturbances could release lead laden scale into tap water, even if the service line is not made of lead.

At Lee Anne Walters’ home, the iron service line was unusually long; at least 150 feet. The EPA believes the scale on her home’s iron service line was ‘seeded’ with lead. The agency believes the water chemistry and a physical disturbance led to extremely high lead levels in Walters’ home. The report notes two relatively new asphalt patches on the road near her home.

The lack of corrosion control treatment in Flint is now well known. But this is the first time physical disturbance has been mentioned as a big risk.

“The jarring and vibration associated with excavation can dislodge the high lead-bearing scales from with the service line pipes,” the report says.

The report makes several recommendations to prevent the release of “large amounts of scale and sediment that could pose an immediate and acute health hazard to the residents.”

More data from intact pipes, lead and non-lead, need to be collected. Assessing the scales within these lines in Flint is “essential” to determine the risk to residents, the report says.

Develop training and public education on potential for “high lead release” from the scales. The report says people should know when utility work is going on and the “potential risk of increased lead levels due to these disturbances.”

VIDEO AND RA INTERVIEW

FLINT, MI (WNEM) - Arthur Woodson is one of many protesters that called for the Environmental Protection Agency to look into his city’s water crisis.

“I wasn't surprised – I am just glad that they brought it out to the open,” Woodson said.

In a detailed report released on Wednesday, the EPA laid out its findings on Flint's water problems.

It found increased lead levels in off Hemphill and Pengelly Roads near Bryant Street.

Susan Hedman is the EPA's administrator for this region.

"The U.S. Environmental Protection Agency is very concerned about lead levels in Flint," Hedman said.

Pete Hall only uses his water to wash his car as his grandson looks on. However, that's as close as he will let him get to the water.

“I'm more scared for the kids drinking it because kids when they get thirsty they going to drink the first thing available," Hall said.

Neighbors said they see no good news insight regarding the water woes of Flint, and they want to be tested.

---

http://www.detroitnews.com/story/news/politics/2015/11/05/experts-water-health-dangers-subside-flint/75255704/

Jim Lynch, The Detroit News 11:32 p.m. EST November 5, 2015

Local health officials and the federal government are warning Flint residents that the danger from their tap water has not subsided even though the city has reconnected to Detroit's water system.

Dr. Mona Hanna-Attisha, the Hurley Medical Center pediatrician who uncovered lead exposure in city children two months ago, wants residents to continue their use of bottled water. This comes three weeks after Flint began receiving its drinking water from the Detroit Water and Sewerage Department.

For the previous 18 months, the city drew its water from the Flint River in an effort to save money. The high corrosive levels of the river water and a failure to use adequate corrosion controls led to unhealthy amounts of lead reaching residents.

In October, Flint and Detroit water officials announced Flint was back online with Detroit's water system, but cautioned it was not a quick fix.

"While the actual switch ... will happen immediately, it is expected that the thorough transition from Flint River water to Detroit water will be complete in approximately three weeks," DWSD said in a statement at the time. Along with the phosphates used by the Detroit system to control corrosion of lead in water delivery pipes, the city of Flint was expected to add measures for protection.

But Hanna-Attisha doesn't want residents taking any chances.

"Even though we've switched to DWSD, we have lost the sealed layer (protecting against) corrosion," she said. "And we've aged our infrastructure 30 years. Nobody knows when that seal will come back ...

"For our most vulnerable populations, pregnant women and infants, they should never be using tap water."

Officials with Michigan's Department of Environmental Quality agreed with Hanna-Attisha's assessment on corrosion measures, saying it has taken "up to several months" in other cities across the country. As a result, residents should try to find out exactly what is or isn't in their water.

"The only way for a homeowner to know for certain is to have their home tested," said DEQ spokesman Brad Wurfel. "DEQ and the city of Flint offer free testing for Flint residents, and we recommend concerned residents take advantage of it."

Greg Eno, a Detroit water system spokesman, said the utility simply provides the water complete with corrosion controls. Measuring how quickly the controls reach maximum effectiveness is done by the city of Flint, which owns the pipelines, he said.

On Wednesday, U.S. Environmental Protection Agency officials issued their own warnings in a report that highlighted the lead dangers inherent in the city's aging underground infrastructure.

"... (E)ven with corrosion control treatment in place in the future, physical disturbances will be capable of dislodging the high lead-bearing scale and sediment from non-lead pipes and well as lead pipes...," according to the report. Such disturbances include construction work and line replacement.

Flint residents have endured problems with their water since the spring of 2014, when the city's state-appointed emergency manager severed the relationship with the Detroit water system system. The hope was that the switch to the Flint River would help the financially troubled city save money until its new water system that draws water from Lake Huron — the Karegondi Water Authority — becomes operational in the second half of 2016.

Almost immediately after the switch, however, residents began reporting foul odors, strange tastes and cloudiness in the water coming from their taps. Local and state officials argued that testing showed the water was safe, but relented a month ago when Hanna-Attisha's deeper dissection of the data found high levels of lead in Flint children.

"Infants and children who drink water containing lead in excess of the action level could experience delays in their physical or mental development," according to the EPA. "Children could show slight deficits in attention span and learning abilities."

Water safety fears led residents such as Kelly Wilson to make tough choices. The 55-year-old regularly makes the trek from her subsidized apartment building to the Family Dollar store just a block to buy water.

Wilson said she spends between $40 and $50 each month, which is difficult since the widow's fixed income during the same period is $740.

She said she can't afford all of the water she needs, so she puts her fears aside long enough to take showers and brush her teeth with the city water.

"I wonder when I'm showering and it gets in my pores — what is this doing to me?" Wilson said.

The lack of faith in Flint's water isn't surprising, Hanna-Attisha said.

"This community has been lied to, and they have no trust, no trust in government," she added.

Critics hold the state responsible for the situation, since Gov. Rick Snyder's appointed emergency manager was in charge when the decision was made to begin drawing water from the river instead of the Detroit system's Lake Huron. Emails between state and federal officials have shown the DEQ was aware of potential problems stemming from a lack of corrosion control as early as February.

On Thursday, a pair of Democratic Flint-area state representatives called for an investigation into how DEQ handled water samples from one home in the city that showed exorbitant levels of lead early in the year. Reps. Phil Phelps of Flushing and Sheldon Neeley of Flint, responding to a Michigan Radio report, said they want to know if state officials threw out the results to keep the city from exceeding federal standards.

In October, DEQ Director Dan Wyant said staffers failed to apply the proper water quality protections as prescribed by the federal Lead and Copper Rule.

Also on Thursday, Senate Minority Leader Jim Ananich, D-Flint, renewed calls for legislative hearings on the state's failure to handle the situation properly. It would include a Senate subcommittee with subpoena powers.

"The Legislature has a unique role and responsibility in thoroughly examining what went wrong, what still needs to be fixed and how to ensure this sort of crisis never happens again," Ananich said.

Snyder appointed a five-person, bipartisan task force to review the actions of DEQ and other governmental agencies in Flint's switch to Flint River water.

State Auditor General Doug Ringle said last week his office will look into questions raised about the department's Office of Drinking Water and Municipal Assistance. Ringler's office already had an operational audit of the office underway before Ananich requested the state auditor find out what "accountability measures" are in place for DEQ staff who do not follow water testing data protocols.

In the meantime, Hanna-Attisha is recommending that those using Flint's tap water use tap filters that are being supplied for free by the city and state. The water also should be used cold, she said, since warmer temperatures cause a greater amount of leaching in lead pipes and plumbing.

<image002.jpg>Tap water in a Flint hospital on Oct. 16, 2015.

The Environmental Protection Agency says it's conducting a full review of what happened in Flint.

For more than a year, state officials assured city residents their water was safe. Those assurances turned out to be wrong.

And it wasn't until some residents got outside experts involved -- who not only found elevated lead levels in the drinking water, but that blood lead levels were also rising in Flint kids – that the state admitted there was a problem.

One of the more troubling charges made against the state is that the Michigan Department of Environmental Quality knowingly dropped lead test samples to avoid exceeding a federal drinking water standard.

Curt Guyette with the ACLU of Michigan wrote about this in September:

An investigation by the ACLU of Michigan -- conducted in conjunction with the study of Flint's water by researchers at Virginia Tech and the citizen group Coalition for Clean Water -- has found that the city, operating under the oversight of the Michigan Department of Environmental Quality, took multiple actions that skewed the outcome of its tests to produce favorable results.

State officials maintain they followed the testing rules for lead under the Safe Drinking Water Act.

But others say that's just not true.

Marc Edwards is an expert on water treatment at Virginia Tech University. He said the first and most important step did not occur in Flint.

The city is supposed to test homes known to either be serviced by lead service lines, or that have lead pipes or pipes with lead solder in them.

Large water systems are supposed to test the "worst-case-scenario" homes to see if they have a problem.

That's the point of the federally-mandated Lead and Copper Rule. Large water systems are supposed to test the “worst-case-scenario” homes to see if they have a problem.

“They did not do that, and that is the primary reason that they missed the worst of the lead problem,” says Edwards.

Edwards lays the blame squarely on the Michigan Department of Environmental Quality – not the city of Flint.

It was a state-appointed emergency manager who made the decision to switch the city’s source of drinking water to save money.

And it was the state’s responsibility to make sure that Flint was managing that switch correctly.

An altered report

“Even though they didn’t sample the highest risk homes in the samples collected by the city, they were still over the action level. So MDEQ, and I’ve never seen this in 25 years, took the initial report that the city gave and altered it,” says Edwards.

Edwards and the ACLU of Michigan obtained internal documents that showed the city originally submitted 71 drinking water samples to the state in July.

We did the math on those samples using the federal lead and copper rule. This original sample pool of 71 put the city over the federally mandated action level of 15 parts per billion of lead.

The city would have had to alert people that there was a lead problem, and they would have had to implement a corrosion control plan to keep the water from corroding the insides of pipes – a plan that was surprisingly absent in Flint. And they may have been required to start replacing lead service lines in the city.

This is all an expensive proposition in a city that made the switch to save money.

But that never happened.

<image006.jpg>

The two reports side by side. The "draft" report shows the original number of samples taken in Flint. The final report shows two samples were dropped.

Credit Flintwaterstudy.org

State officials came back and told the city to drop two samples.

Dropping those two samples put the city below the action level for lead. If the state had just dropped one high sample, Flint still would have been over the federal action level.

But dropping two samples put them below the action level.

To see exactly how this math works, check out this post.

The samples in question

Mike Glasgow is with the city of Flint. He's the guy in charge of collecting the water samples.

Glasgow remembers including samples taken at one home that showed extremely high lead levels. A sample of Lee Anne Walters' home turned up a result of 104 parts per billion – almost seven times the federally mandated limit.

"I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report."

"They instructed me to take it off the report," says Glasgow. "I know she had taken some other samples and they had all the results too. I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report."

The state denies any wrongdoing.

Dan Wyant is the director of the Michigan Department of Environmental Quality.

"What you're suggesting is somehow that we dropped two tests purposely, and I can say we've gone back and looked at this," says Wyant. "And so we've asked somebody in our laboratory. When the test comes in that doesn't meet the protocol definition, they drop that test by definition alone, and so the reality is that's how that sample got dropped."

State officials say a sample from one home was dropped because there was a water filter. Homes with water filters are excluded because they might give a low result.

But the test result that was dropped –– the result from Lee Anne Walters home -- was the highest test result in the 2015 sampling pool: 104 parts per billion.

The second sample that was dropped showed 20 parts per billion of lead. The state says that sample was dropped because federal rules state that a sample can't come from a business. It has to come from a home.

Spirit of the rule not followed?

So state officials say they made Flint drop test results because those samples didn't follow guidelines.

But the guidelines for all the samples weren't followed in the first place.

Federal rules say you must test the "worst-case-scenario" homes – the homes connected to pipes with lead in them. But the city didn't do that.

Elin Betanzo is a water quality expert with the Northeast-Midwest Institute. She worked in the EPA's drinking water office for eight years.

She says the rules say if a site is sampled – even if it's not technically supposed to be in the sampling pool – the results should still be used to determine if the water supply is safe.

"If they did find high lead levels, that's high lead levels in the water system. And the whole point of the rule is to be protective of public health for everyone consuming that water," Betanzo says. "So if one unplanned home is having high lead levels, that should factor into the compliance calculation."

Marc Edwards says there are a lot of ways water utilities can "game" the lead and copper rule to try to turn up favorable results. In 2009, his team put out a white paper showing what he calls a list of "cheating strategies" used to get around the spirit of the lead and copper rule.

There are a lot of people looking into what was done in Flint. Governor Snyder appointed a panel to conduct a review. And EPA officials say they hope to share the results of their review sometime next week.

News Headline: State knew risks before health crisis over lead in Flint's water |

Outlet Full Name: Detroit Free Press
News Text: State and local officials knew in 2013 that without proper treatment of water drawn from the Flint River, they risked subjecting the people of Flint to lead-contaminated drinking water.

But the next year, the Michigan Department of Environmental Quality OK'd Flint's plan to pump water from the river, and into residents' homes, without adding an important chemical that would prevent contamination from lead in old pipes.

A report commissioned by Flint in 2011 evaluating the Flint River as a long-term source of drinking water, and delivered by the city to the MDEQ two years later, included that chemical - phosphate, often referred to as corrosion control - on a list of chemicals required to make river water safe to drink. Two years later, a Flint employee e-mailed the report to an MDEQ drinking water official, who passed it along to another state staffer, documents obtained by the Free Press via a Freedom of Information Act request show.

For water treatment professionals, the importance of phosphates is obvious: More corrosive water is more likely to degrade the interior of service lines, allowing dangerous substances from those pipes to enter the water. By forming a barrier inside service lines and plumbing pipes, phosphates limit the corrosive effect of water and stop lead from contaminating the water.

It's also common knowledge that river water, subject to constant changes of temperature and makeup, tends to be more corrosive than lake water - and is likely to require treatment with phosphates. Nor is it a mystery that an aging, broke city like Flint would have older homes with lead plumbing, or that its water distribution system would include lead service lines or welds.

And this is why the MDEQ's public response to the drinking water crisis in Flint - a spike in lead levels that has resulted in an increased number of lead-poisoned kids - doesn't add up.

New authority

Flint opted in 2013 to join a new regional water authority. While that system was under construction, Flint chose to pump water from the Flint River instead of continuing to purchase it from the Detroit Water and Sewerage Department.

Sixteen months after the switch, lead in the city's drinking water had spiked; the number of Flint kids with elevated blood-lead levels had increased. Lead poisoning is irreversible and causes developmental and behavioral problems.

MDEQ chief Dan Wyant has said that in evaluating Flint's water treatment plan, the agency mistakenly applied the wrong federal guideline; an MDEQ spokesman said that the Environmental

Protection Agency's standard is ambiguously worded.

But then there's that report. Why didn't Flint - or the state - pay attention?

Ask, and there are no good answers.

"Flint commissioned the report you mentioned," MDEQ spokesman Brad Wurfel said. "If they ignored the recommendations in an appendix of the report they commissioned, they can probably best explain why."

A spokesman for Flint Mayor Dayne Walling, who lost his seat in last week's election, directed inquiries to the city's director of public works, Howard Croft.

"As public works director" - whose responsibilities include oversight of water treatment and a host of other services - "I cannot specifically tell you why phosphate was not approached," Croft said. "It was brought up by our engineering firm, they did ask those questions. Our state licensing director brought up those questions. ... That's pretty much the discussion that's out there."

MDEQ signed off on the plan, Croft said, and after Flint began pumping river water in April 2014, embarked on a cycle of water testing: two six-month rounds that the state says it believed complied with EPA's requirements. As for Flint, Croft said, the city believed it was in compliance with state and federal drinking water rules.

Why did neither insist on corrosion control?

"I think it's a fair question," Croft said.

When those test results started rolling in, there were more red flags. During the first six-month test span, July to December 2014, results showed 6 parts of lead per billion in Flint's water. By the end of June 2015, the amount of lead in Flint water had almost doubled, to 11 parts per billion. A draft of a memo written by an EPA drinking water specialist, leaked to an investigative reporter for the American Civil Liberties Union in July, identified multiple problems with the city and state's water testing.

Despite all of that, MDEQ's Wurfel insisted that Flint residents should relax, that the city's drinking water was safe.

By the time MDEQ acknowledged that Flint's water supply was compromised, it was September. The city never started corrosion control. It rejoined DWSD last month.

Warnings unheeded

The report didn't alter the outcome in Flint. But it doesn't even seem to have caused drinking water managers at the city or the state to question the city's water treatment plan, to wonder whether perhaps river water should be treated for corrosion control.

And that, perhaps, is the most shocking part of Flint's water debacle. None of these warnings - not a report listing corrosion control as a requirement for using Flint River water, not test results showing rising lead levels, not an EPA memo calling the city's findings into question - moved the state to action.

Not even a local pediatrician's analysis of blood-lead level screenings for hundreds of Flint kids - finding that an increasing number had elevated blood-lead levels, a reversal of a decades-long trend - caused a sense of urgency among state regulators. For more than a week, spokespeople for Gov. Rick Snyder and MDEQ downplayed and discredited the results.

It's incomprehensible.

MDEQ is charged with overseeing compliance with environmental regulations across the state, with ensuring that companies and cities follow local, state and federal guidelines.

In Flint, there was another layer of state oversight - that city spent the last two years under the oversight of a state-appointed emergency manager, brought in to resolve the city's budget deficit. An emergency manager, with the approval of then-state Treasurer Andy Dillon, OK'd Flint's decision to join the Karegnondi Water Authority, the new regional system. And an emergency manager approved Flint's decision to use river water.

Finding out what happened in Flint will be complicated. Snyder has appointed a task force to investigate. U.S. Rep. Dan Kildee and state Senate Minority Leader Jim Ananich, both Flint Democrats, have asked the EPA to investigate. Ananich is calling for a Senate committee to hold public hearings.

There's one more thing the city, or MDEQ, might have learned from that 2011 report about Flint River water: Phosphates are cheap. To prevent lead from contaminating Flint's water, to protect children from the lifelong damage caused by lead poisoning, wouldn't have cost much.

Just $60 a day.

http://michiganradio.org/post/recall-petition-filed-oust-gov-snyder#stream/0

By Steve Carmody – Nov. 9, 2015

A one-man effort to recall Governor Rick Snyder from office faces a big hurdle this week.

Angelo Brown says Governor Snyder deserves to be recalled because of the role his administration played in the Flint drinking water crisis.

Brown's recall petition accuses the governor of being "culpable" in the decisions that lead to the use of corrosive Flint River water as the city's drinking water source.

The Detroit pastor says the governor doesn't "accept high levels of incompetence himself".

"And I think we got to hold him to the same standard," Brown said last week.

Brown is running what amounts to a one-man campaign.

If the Board of Canvassers approves his recall petition language, he'll have to collect nearly 800,000 valid signatures to earn a place on the ballot next year.

The governor's spokesman would only say "recall attempts are a part of the democratic process."

<hr size=3 width="100%" align=center>

http://www.mlive.com/opinion/flint/index.ssf/2015/11/full_investigation_needed_at_e.html

Mlive/Flint Journal Opinion by U.S. Rep. Dan Kildee, Nov. 6, 2015

It's clear that the Flint water crisis was a failure of government. Residents are rightfully angry, and I'm angry over the lack of immediate action to address unsafe lead levels in the city's water.

Despite independent research showing elevated lead levels by experts Dr. Marc Edwards and Dr. Mona Hanna-Attisha, the Michigan Department of Environmental Quality (MDEQ) and Environmental Protection Agency (EPA) stalled for weeks, saying there was no cause for concern and denying there was even a problem.

Now, state officials have admitted that drinking water laws were not followed. Yet inaction by officials has already caused considerable harm. The people of Flint are victims of this failure of government, and there needs to be accountability.

That's why I've called for a thorough investigation into the water problems in Flint. And that's why I continue to stress that both the MDEQ and EPA act in an urgent manner to address this public health crisis. A complete review of actions at every level will result in answers and transparency, and hopefully it will begin to restore public confidence for

Flint residents. It will also ensure that we take steps to make sure this never happens again, in Flint or in other cities across the country.

Residents deserve to know why for months the state of Michigan failed to follow federal safe drinking water laws. They also deserve to know why corrosion control treatments were not in place when the city's water supply switched to the Flint River. I continue to push for full transparency and answers to these questions and more.

Additionally, I continue to advocate for long-term solutions to improve Flint's water infrastructure. Lead-clearing filters, bottled water and even reconnecting to the Detroit water system are critical steps, but they won't solve the problem. Flint River water has caused extensive damage to Flint's aged water infrastructure, and major investments are needed to make repairs and ensure water quality going forward.

For almost a year, I have been advocating for the state of Michigan and EPA to forgive Flint's federal loans through the Safe Drinking Water State Revolving Fund in order to free up money to make it possible for Flint to make system improvements – including replacement of lead service lines. Both the state and federal government have to take responsibility and act.

Flint is a financially distressed city that simply doesn't have the money to pay for water improvements made necessary by the state's very costly and ill-thought out decision. It was under a state-appointed emergency manager that the decision was made to switch the drinking water source for the city, from the Detroit Water Authority to the Flint River.

Simply put, Flint should not have to foot the bill for the state and EPA's mistakes.

To exacerbate the crisis, the state of Michigan sadly has cut tens of millions of dollars in revenue sharing in recent years. This money could have helped to make critical infrastructure improvements in the community.

Now as a result, Flint – and a whole subset of older, industrial American cities – stand to be left behind in the new economy if we don't make critical investments.

Access to safe drinking water is a fundamental right. Having a water system that delivers clean drinking water to our schools and children is not up for debate.

Under the law, it is the responsibility of the state and federal government to ensure safe drinking water. And the very agencies of government charged with protecting public health failed to do that.

The state and federal government both need to act to fix the problems created by the failed policies that led to this crisis. Neither has an excuse not to.

U.S. Rep. Dan Kildee, D-Flint Twp., is a Flint native and represents Michigan's 5th District, which includes Flint and Genesee County, in Congress. You can find him on Facebook and Twitter.

---

http://www.wxyz.com/news/task-force-appointed-to-investigate-flint-water-emergency-expected-finish-investigation-next-year

By Jim Kiertzner, Nov. 6, 2015

(Flint – WXYZ) -- The evidence is overwhelming - state and federal officials failed to protect something we all take for granted: tap water.

People in Flint have been drinking water that tests have shown is laced with lead snd detrimental health effects are already happening.

It could have been prevented.

It was caused by money, or a lack of it - Detroit had raised its rates.

On April 30, 2014 Flint disconnected from the Detroit water system as a temporary move until a new water system being built from Lake Huron is done in 2016.

The final decision to disconnect was made by then Emergency Manager Darnell Earley who was appointed by Governor Rick Snyder. Earley is currently running Detroit Public Schools as EM.

The back up plan was to use Flint River water and a water treatment plant that had not been used on a regular basis for some 50 years.

It turns out lead was getting into the water because of improper treatment of the river water, which is more corrosive and causes lead to leach from pipes and solder in pipes.

The lead was not discovered by government tests. It was discovered by families, voluntary researchers from Virginia Tech and Hurley Medical Center in Flint.

Governor Rick Snyder finally came to Flint last month with a financial plan to reconnect Flint to Detroit water. But the damage has been done.

People want investigations, accountability and action.

Dr. Lawrence Reynolds is a Pediatrician in Flint and is one of five members of the task force appointed by Snyder.

Dr. Reynolds tells 7 Investigator Jim Kiertzner that he drinks Flint water and he treats flint children. He will see to it that the task force gets the job done with answers, action and even remediation.

The task force meets weekly sometimes in public, sometimes in private. Its work is expected to be done early next year. We will continue to follow it.

There are also more calls for other investigations from Flint area state lawmakers. Republicans control both chambers in the Michigan Legislature and it is not clear of those investigations will happen.

http://www.lansingstatejournal.com/story/news/local/2015/11/08/year-water-change-state-knew-risks-flint/75378034/

By Nancy Kaffer, Detroit Free Press Columnist, Nov. 8, 2015

State and local officials knew in 2013 that without proper treatment of water drawn from the Flint River, they risked subjecting the people of Flint to lead-contaminated drinking water.

But the next year, the Michigan Department of Environmental Quality OK'd Flint's plan to pump water from the river, and into residents' homes, without adding an important chemical that would prevent contamination from lead in old pipes.

A report commissioned by Flint in 2011 evaluating the Flint River as a long-term source of drinking water, and delivered by the city to the MDEQ two years later, included that chemical - phosphate, often referred to as corrosion control - on a list of chemicals required to make river water safe to drink. Two years later, a Flint employee e-mailed the report to an MDEQ drinking water official, who passed it along to another state staffer, documents obtained by the Free Press via a Freedom of Information Act request show.

For water treatment professionals, the importance of phosphates is obvious: More corrosive water is more likely to degrade the interior of service lines, allowing dangerous substances from those pipes to enter the water. By forming a barrier inside service lines and plumbing pipes, phosphates limit the corrosive effect of water and stop lead from contaminating the water.

It's also common knowledge that river water, subject to constant changes of temperature and makeup, tends to be more corrosive than lake water - and is likely to require treatment with phosphates. Nor is it a mystery that an aging, broke city like Flint would have older homes with lead plumbing, or that its water distribution system would include lead service lines or welds.

And this is why the MDEQ's public response to the drinking water crisis in Flint - a spike in lead levels that has resulted in an increased number of lead-poisoned kids - doesn't add up.

New authority

Flint opted in 2013 to join a new regional water authority. While that system was under construction, Flint chose to pump water from the Flint River instead of continuing to purchase it from the Detroit Water and Sewerage Department.

Sixteen months after the switch, lead in the city's drinking water had spiked; the number of Flint kids with elevated blood-lead levels had increased. Lead poisoning is irreversible and causes developmental and behavioral problems.

MDEQ chief Dan Wyant has said that in evaluating Flint's water treatment plan, the agency mistakenly applied the wrong federal guideline; an MDEQ spokesman said that the Environmental Protection Agency's standard is ambiguously worded.

But then there's that report. Why didn't Flint - or the state - pay attention?

Ask, and there are no good answers.

"Flint commissioned the report you mentioned," MDEQ spokesman Brad Wurfel said. "If they ignored the recommendations in an appendix of the report they commissioned, they can probably best explain why."

A spokesman for Flint Mayor Dayne Walling, who lost his seat in last week's election, directed inquiries to the city's director of public works, Howard Croft.

"As public works director" - whose responsibilities include oversight of water treatment and a host of other services - "I cannot specifically tell you why phosphate was not approached," Croft said. "It was brought up by our engineering firm, they did ask those questions. Our state licensing director brought up those questions. ... That's pretty much the discussion that's out there."

MDEQ signed off on the plan, Croft said, and after Flint began pumping river water in April 2014, embarked on a cycle of water testing: two six-month rounds that the state says it believed complied with EPA's requirements. As for Flint, Croft said, the city believed it was in compliance with state and federal drinking water rules.

Why did neither insist on corrosion control?

"I think it's a fair question," Croft said.

When those test results started rolling in, there were more red flags. During the first six-month test span, July to December 2014, results showed 6 parts of lead per billion in Flint's water. By the end of June 2015, the amount of lead in Flint water had almost doubled, to 11 parts per billion. A draft of a memo written by an EPA drinking water specialist, leaked to an investigative reporter for the American Civil Liberties Union in July, identified multiple problems with the city and state's water testing.

Despite all of that, MDEQ's Wurfel insisted that Flint residents should relax, that the city's drinking water was safe.

By the time MDEQ acknowledged that Flint's water supply was compromised, it was September. The city never started corrosion control. It rejoined DWSD last month.

Warnings unheeded

The report didn't alter the outcome in Flint. But it doesn't even seem to have caused drinking water managers at the city or the state to question the city's water treatment plan, to wonder whether perhaps river water should be treated for corrosion control.

And that, perhaps, is the most shocking part of Flint's water debacle. None of these warnings - not a report listing corrosion control as a requirement for using Flint River water, not test results showing rising lead levels, not an EPA memo calling the city's findings into question - moved the state to action.

Not even a local pediatrician's analysis of blood-lead level screenings for hundreds of Flint kids - finding that an increasing number had elevated blood-lead levels, a reversal of a decades-long trend - caused a sense of urgency among state regulators. For more than a week, spokespeople for Gov. Rick Snyder and MDEQ downplayed and discredited the results.

It's incomprehensible.

MDEQ is charged with overseeing compliance with environmental regulations across the state, with ensuring that companies and cities follow local, state and federal guidelines.

In Flint, there was another layer of state oversight - that city spent the last two years under the oversight of a state-appointed emergency manager, brought in to resolve the city's budget deficit. An emergency manager, with the approval of then-state Treasurer Andy Dillon, OK'd Flint's decision to join the Karegnondi Water Authority, the new regional system. And an emergency manager approved Flint's decision to use river water.

Finding out what happened in Flint will be complicated. Snyder has appointed a task force to investigate. U.S. Rep. Dan Kildee and state Senate Minority Leader Jim Ananich, both Flint Democrats, have asked the EPA to investigate. Ananich is calling for a Senate committee to hold public hearings.

There's one more thing the city, or MDEQ, might have learned from that 2011 report about Flint River water: Phosphates are cheap. To prevent lead from contaminating Flint's water, to protect children from the lifelong damage caused by lead poisoning, wouldn't have cost much.

Just $60 a day.

http://michiganradio.org/post/recall-petition-filed-oust-gov-snyder#stream/0

By Steve Carmody – Nov. 9, 2015

A one-man effort to recall Governor Rick Snyder from office faces a big hurdle this week.

Angelo Brown says Governor Snyder deserves to be recalled because of the role his administration played in the Flint drinking water crisis.

Brown’s recall petition accuses the governor of being “culpable” in the decisions that lead to the use of corrosive Flint River water as the city’s drinking water source.

The Detroit pastor says the governor doesn’t “accept high levels of incompetence himself”.

“And I think we got to hold him to the same standard,” Brown said last week.

Brown is running what amounts to a one-man campaign.

If the Board of Canvassers approves his recall petition language, he'll have to collect nearly 800,000 valid signatures to earn a place on the ballot next year.

The governor's spokesman would only say "recall attempts are a part of the democratic process."

<hr size=3 width="100%" align=center>

http://www.mlive.com/opinion/flint/index.ssf/2015/11/full_investigation_needed_at_e.html

Mlive/Flint Journal Opinion by U.S. Rep. Dan Kildee, Nov. 6, 2015

It's clear that the Flint water crisis was a failure of government. Residents are rightfully angry, and I'm angry over the lack of immediate action to address unsafe lead levels in the city's water.

Despite independent research showing elevated lead levels by experts Dr. Marc Edwards and Dr. Mona Hanna-Attisha, the Michigan Department of Environmental Quality (MDEQ) and Environmental Protection Agency (EPA) stalled for weeks, saying there was no cause for concern and denying there was even a problem.

Now, state officials have admitted that drinking water laws were not followed. Yet inaction by officials has already caused considerable harm. The people of Flint are victims of this failure of government, and there needs to be accountability.

That's why I've called for a thorough investigation into the water problems in Flint. And that's why I continue to stress that both the MDEQ and EPA act in an urgent manner to address this public health crisis. A complete review of actions at every level will result in answers and transparency, and hopefully it will begin to restore public confidence for Flint residents. It will also ensure that we take steps to make sure this never happens again, in Flint or in other cities across the country.

Residents deserve to know why for months the state of Michigan failed to follow federal safe drinking water laws. They also deserve to know why corrosion control treatments were not in place when the city's water supply switched to the Flint River. I continue to push for full transparency and answers to these questions and more.

Additionally, I continue to advocate for long-term solutions to improve Flint's water infrastructure. Lead-clearing filters, bottled water and even reconnecting to the Detroit water system are critical steps, but they won't solve the problem. Flint River water has caused extensive damage to Flint's aged water infrastructure, and major investments are needed to make repairs and ensure water quality going forward.

For almost a year, I have been advocating for the state of Michigan and EPA to forgive Flint's federal loans through the Safe Drinking Water State Revolving Fund in order to free up money to make it possible for Flint to make system improvements – including replacement of lead service lines. Both the state and federal government have to take responsibility and act.

Flint is a financially distressed city that simply doesn't have the money to pay for water improvements made necessary by the state's very costly and ill-thought out decision. It was under a state-appointed emergency manager that the decision was made to switch the drinking water source for the city, from the Detroit Water Authority to the Flint River.

Simply put, Flint should not have to foot the bill for the state and EPA's mistakes.

To exacerbate the crisis, the state of Michigan sadly has cut tens of millions of dollars in revenue sharing in recent years. This money could have helped to make critical infrastructure improvements in the community.

Now as a result, Flint – and a whole subset of older, industrial American cities – stand to be left behind in the new economy if we don't make critical investments.

Access to safe drinking water is a fundamental right. Having a water system that delivers clean drinking water to our schools and children is not up for debate.

Under the law, it is the responsibility of the state and federal government to ensure safe drinking water. And the very agencies of government charged with protecting public health failed to do that.

The state and federal government both need to act to fix the problems created by the failed policies that led to this crisis. Neither has an excuse not to.

U.S. Rep. Dan Kildee, D-Flint Twp., is a Flint native and represents Michigan's 5th District, which includes Flint and Genesee County, in Congress. You can find him on Facebook and Twitter.

http://www.wxyz.com/news/task-force-appointed-to-investigate-flint-water-emergency-expected-finish-investigation-next-year

By Jim Kiertzner, Nov. 6, 2015

(Flint – WXYZ) -- The evidence is overwhelming - state and federal officials failed to protect something we all take for granted: tap water.

People in Flint have been drinking water that tests have shown is laced with lead snd detrimental health effects are already happening.

It could have been prevented.

It was caused by money, or a lack of it - Detroit had raised its rates.

On April 30, 2014 Flint disconnected from the Detroit water system as a temporary move until a new water system being built from Lake Huron is done in 2016.

The final decision to disconnect was made by then Emergency Manager Darnell Earley who was appointed by Governor Rick Snyder. Earley is currently running Detroit Public Schools as EM.

The back up plan was to use Flint River water and a water treatment plant that had not been used on a regular basis for some 50 years.

It turns out lead was getting into the water because of improper treatment of the river water, which is more corrosive and causes lead to leach from pipes and solder in pipes.

The lead was not discovered by government tests. It was discovered by families, voluntary researchers from Virginia Tech and Hurley Medical Center in Flint.

Governor Rick Snyder finally came to Flint last month with a financial plan to reconnect Flint to Detroit water. But the damage has been done.

People want investigations, accountability and action.

Dr. Lawrence Reynolds is a Pediatrician in Flint and is one of five members of the task force appointed by Snyder.

Dr. Reynolds tells 7 Investigator Jim Kiertzner that he drinks Flint water and he treats flint children. He will see to it that the task force gets the job done with answers, action and even remediation.

The task force meets weekly sometimes in public, sometimes in private. Its work is expected to be done early next year. We will continue to follow it.

There are also more calls for other investigations from Flint area state lawmakers. Republicans control both chambers in the Michigan Legislature and it is not clear of those investigations will happen.

By Steve Carmody • 16 hours ago

A meeting this week may help produce an update into a possible federal probe of Flint's water problems.

Rep. Dan Kildee (D-FLint)

Credit Steve Carmody / Michigan Radio

Congressman Dan Kildee says he plans to meet this week with Regional EPA director Susan Hedman to discuss the status of an investigation into Flint's drinking water problems.

Kildee says the investigation has to look beyond just assessing blame.

"So that whoever's responsible for the decisions or neglect that led to Flint water being laced with lead will have to step up and be responsible for correcting whatever short or long term implications came with those decisions," says Kildee.

Documents obtained by Michigan Radio have raised questions about testing that failed to show rising lead levels in Flint's drinking water, after the city started using the Flint River as its tap water source.

Tests by Virginia Tech researchers suggest the corrosive nature of the Flint River has done significant damage to pipes in the city, both in people's homes and the city's transmission lines. It's estimated the cost of repairing and replacing damaged pipes can range from the tens to the hundreds of millions of dollars.

After 18 months drawing water from the Flint River, the city returned to the Detroit Water and Sewerage Department, after receiving $6 million dollars from the state government and $4 million dollars from a local foundation.

Next year, Flint will switch water sources again. The new Karegnondi water pipeline is expected to start flowing water from Lake Huron to Flint next summer.

Meanwhile, Rep. Dan Kildee's not entirely confident the EPA investigation will be thorough enough.

---

http://wdet.org/posts/2015/11/09/81895-report-state-officials-aware-of-problem-with-flint-river-water/

Nov. 9, 2015

Documents reportedly reveal state environmental officials knew untreated Flint River water could harm residents.

State officials reportedly knew of problems with Flint's water supply long before the city switched to a new system that may have contaminated those who used it with lead poisoning.

A study commissioned by Flint and delivered to state environmental officials in 2013 reportedly revealed that water drawn from the city's river could put residents at risk unless it was first treated with a certain chemical.

The Detroit Free Press reports that documents show the Michigan Department of Environmental Quality approved the city's plan to begin using water from the Flint River anyway without it being treated with the necessary chemical.

Flint recently rejoined Detroit's water system after researchers found some children drinking Flint's water had double, and sometimes triple, the typical amount of lead in their bloodstream.

Governor Rick Snyder has created a task force to examine how the situation developed while members of both Congress and the state legislature are requesting that the Environmental Protection Agency investigate the matter.

http://www.washingtontimes.com/news/2015/nov/10/state-urges-water-tests-at-flint-homes-businesses-/

Flint Mayor Karen Weaver smiles as she hugs a supporter after being sworn into office Monday, Nov. 9, 2015, at City Hall in Flint, Mich. Voters have ousted mayor Dayne Walling amid a fallout over the city's drinking water problems. ... more >

By - Associated Press - Tuesday, November 10, 2015

FLINT, Mich. (AP) - The results of water tests at several hundred buildings in Flint indicate that drinking water at all homes, businesses and schools needs to be tested for possible lead contamination, state officials said.

The Michigan Department of Environmental Quality said tests from nearly 400 homes and businesses as well as comprehensive results from Freeman Elementary School indicate problems with lead are localized to individual buildings or even individual faucets.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," George Krisztian, the DEQ's Flint

Action Plan Coordinator, said in a statement Monday. “We want to see all families in Flint take advantage of free water testing from the state.”

Flint switched from Detroit’s water system last year to Flint River water in a cost-cutting move while under state emergency financial management. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

But residents complained about the taste, smell and appearance of the water. Officials maintained the water met safety standards, but children were found to have elevated levels of lead in their blood and it was determined that corrosive river water was drawing lead from aging pipes.

Flint has since switched back to water from Detroit’s system. Last week, voters ousted Flint’s mayor amid fallout over the city’s drinking water problems. Newcomer Karen Weaver beat incumbent Dayne Walling, who led the city during the public health emergency and blamed state and federal agencies for the city’s water problems.

Weaver was sworn in Monday, saying her election showed residents are “sick and tired of poison water” and she renewed her call on the federal government to declare the city a federal disaster area.

At Freeman Elementary, 31 faucets were tested. There was no lead exposure from 22 outlets, but nine came back with initially high results. When the faucets and fountains were operated for several minutes, lead levels fell significantly, in some cases to non-detectable levels, the state said.

The DEQ is suggesting that the faucets be flushed before use but on the long-term need to be replaced.

Meanwhile, parents in Flint can get their children tested for lead during an education program hosted by the school district Thursday at Brownell STEM Academy, The Flint Journal reported.

http://michiganradio.org/post/source-high-lead-levels-drinking-water-one-flint-school-identified

By Steve Carmody • 16 hours ago

New tests suggest high lead levels in the drinking water at one Flint school may have a simple and inexpensive solution. FREEMAN elementary in Flint, Michigan

Initial test results on drinking water samples taken at Freeman Elementary showed high levels of lead in the water: 101 parts per billion or roughly six times the federal action level for lead in tap water.

Follow up tests were conducted last month on water at four Flint schools that tested at or above the federal action level.

The tests are now in for Freeman elementary.

The MDEQ took samples from 31 water sources at the school. They detected higher than 15 ppb from 9 of the fixtures. Follow up tests of the fixtures and the school's plumbing found the problem was not in the pipes, but the faucets.

"The issues that we found were definitely fixture related," says George Krisztian, the Flint Action Plan Coordinator for the Michigan Department of Environmental Quality.

The Flint Community School district now plans on removing the suspect fixtures.

"We will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected," Says Superintendent Bilal Tawwab.

When tests showed elevated levels of lead in Flint drinking water and elevated blood lead levels in school age children in Flint, the school district shut off many drinking fountains and other sources of drinking water. Researchers blame the rising lead levels on the corrosive water from the Flint River, which the city started using as its drinking water source in 2014. The city switched back to the Detroit Water and Sewerage Department after numerous problems with the Flint River water.

The school district has more than 300,000 thousand bottles of drinking water for students and teachers.

The state is offering additional testing at all Flint schools, including charter, private and parochial schools.

By Carrie Widenmier

FLINT, MI (AP) - The federal government says it will conduct an audit of how the state of Michigan oversees public water supplies.

The audit announced Tuesday is in response to the water crisis in Flint. The city switched water sources in 2014, and the corrosive water released lead from old pipes.

Gov. Rick Snyder's Department of Environmental Quality acknowledges that drinking water rules were not followed when Flint made the switch to the Flint River. Flint now gets water from the Detroit system.

The EPA says it will investigate how Michigan enforces rules on lead, copper and nitrates and will identify ways to possibly strengthen state oversight.

The audit will take several months and will be released to the public.

http://www.mlive.com/news/flint/index.ssf/2015/11/epa_says_it_will_audit_michiga.html

By Ron Fonger | rfonger1@mlive.com
on November 10, 2015 at 1:43 PM

FLINT, MI -- In the wake of a public health crisis over high lead levels in water in some Flint homes, the U.S. Environmental Protection Agency has announced it will audit the state's drinking water program.

A Nov. 10 news release from the EPA says it will examine the Michigan Department of Environmental Quality's "implementation of the Safe Drinking Water Act and related rules on lead and copper, total coliform, nitrates and ground water."

The audit comes after requests for a federal investigation of Flint's water crisis by U.S. Rep. Dan Kildee, D-Flint, and state Senate Minority Leader Jim Ananich, D-Flint.

Brad Wurfel, a spokesman for the DEQ, issued a statement today, pledging the agency's cooperation.

"EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act," EPA Region 5 Administrator Susan Hedman said in a written statement.

"This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program."

The EPA news release says employees of the agency will go to MDEQ offices to review state files on public water system compliance with the SDWA and will review the state's oversight of public water systems.

"The audit will consist of a full programmatic review that supplements the reviews of the Michigan drinking water program that EPA conducts each year," the news release says.

The audit is expected to take several months to complete and a report will be issued when it is complete.

In separate letters to Gina McCarthy, administrator of the EPA, last month, Kildee and Ananich asked for the federal review of the MDEQ's oversight of water treatment in Flint.

A public health emergency was issued here after researchers from Virginia Tech university and a Hurley Medical Center doctor discovered high lead levels in Flint's water supply and rising blood lead levels in children since the city switched its water source from Lake Huron to the Flint River in April 2014.

DEQ Director Dan Wyant has said state regulators mistakenly allowed the city to distribute river water without requiring that it be treated to make it less corrosive.

Wurfel said in an email to The Flint Journal-MLive that the DEQ "welcomes this announcement from EPA, and we've already signaled to them that they can count on our full cooperation and transparency."

"We've appreciated the federal government's support on the situation in Flint --including its announcement last week that the Lead and Copper rule speaks ambiguously on the corrosion control issue," Wurfel's statement says.

"Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated – in Michigan, or anywhere else."

Ananich said the federal investigation would not have been necessary if an independent commission with subpoena power had been appointed by Gov. Rick Snyder.

Still, the senator said he's interested in the federal review.

"I want to see (EPA's findings)," he said. "I'm hoping it's thorough and of value."

---

http://michiganradio.org/post/us-epa-will-audit-michigan-safe-drinking-water-program-wake-flints-problems

By Steve Carmody • 2 hours ago

A federal agency will review how the state of Michigan monitors local drinking water.

“What happened in Flint shouldn’t have happened," says EPA Region 5 administrator Susan Hedman, who says as a result, "There is a lack of public confidence in the drinking water program here in Michigan.”

Regional EPA administrator Susan Hedman says her agency will conduct an audit of the Michigan Department of Environmental Quality’s drinking water program.

“EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act,” Hedman said. “This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program.”

MDEQ has been criticized for failing to detect problems with Flint’s drinking water after the city switched to its namesake river last year.

During the 18 months that the city took its tap water from the Flint River, residents complained about the smell, taste and appearance of their drinking water. There were also E coli outbreaks and higher than acceptable levels of chemicals used to treat the water, as well as their by-products.

Researchers also claim the corrosiveness of the river water damaged pipes containing lead, in people’s homes and in city transmission lines. The result was increasing levels of lead in the city’s drinking water.

The MDEQ apparently failed to insure the city used proper corrosion controls to lessen the effect of the river water.

“What happened in Flint shouldn’t have happened," says Hedman, who says as a result, "There is a lack of public confidence in the drinking water program here in Michigan.”

A spokesman says the agency welcomes the EPA review of its drinking water program, adding EPA “can count on our full cooperation and transparency.”

The written statement continues:

“We’ve appreciated the federal government’s support on the situation in Flint – including its announcement last week that the Lead and Copper rule speaks ambiguously on the corrosion control issue. Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated – in Michigan, or anywhere else."

MDEQ officials say tests from nearly 400 homes and businesses in Flint indicate problems with lead are localized to individual buildings or even individual faucets.

For Immediate Release
november 11, 2015

WASHINGTON, D.C. – U.S. Senator Debbie Stabenow today issued the following statement regarding the Environmental Protection Agency’s decision to audit the Michigan Department of Environmental Quality’s drinking water program:

“It is clear that the State of Michigan made multiple mistakes and misjudgments, which have seriously harmed the health of the people of Flint. The EPA is taking critical steps today to get to the bottom of this outrageous situation. Everything must be done to make sure families and communities in Flint have safe drinking water.”

Flint's Democratic Congressman Dan Kildee joined us today to discuss the EPA's audit.

Listen

Listening...

10:24

Congressman Dan Kildee (D-MI) shares his thoughts on the Flint water crisis.

Kildee says it appears the EPA's audit of the MDEQ is the federal review that has the teeth that he's been looking for.

"It seems that there is incompetence, or mismanagement, or a lack of attention within the Department of Environmental Quality. They sort of have acknowledged that themselves in this case. That kind of failure has consequences. And they could be significant health consequences," says Kildee.

Kildee says he's not concerned about the EPA being complicit in the failings that occurred in Flint, saying the federal agency pushed the state for answers on whether or not a corrosion control program had been implemented.

The state initially replied that they did have a corrosion control program in place. That later turned out to not be true.

Kildee says the larger lesson in this is that people can't take a "bean counter" approach to managing cities. He says politicians who equate running a business with running a government are missing the point.

"You can bankrupt a business. You can disassemble a business. You can sell off the parts and put it away. Cities are human organisms. You can't just simply treat it as if,'well, you know what, we'll save money over here, and the balance sheet looks better.'"

The result of this decision, Kildee says, was "lead-laced water going into the bodies of children."

He says the Snyder administration looks at a lot of problems as "balance sheet problems," and says that's why it failed in this case.

Thank you, Susan. This sounds encouraging, and I want to thank you and your team, as well as everyone in Public Affairs and Congressional, for all the work that has gone into the events today. Hopefully this will enable us to continue a strong message moving forward and keep us focused on supporting everyone who is working to provide better drinking water for the people of Flint.

My instinct is that it probably would be worth a download call just to have everybody hear the story once vs. your having to tell it multiple times, but I am open to others' suggestions on this point. Sounds like it could be a little easier than the other calls we've been having on people's personal time!! I will be available tomorrow in the morning before 10:30 Eastern time or in the afternoon after 2:00 p.m. But if other folks want to do something later today, you should go ahead without me.

Subject: Briefing for Rep Kildee and Rep Lawrence

The briefing went very well this morning. Rep Kildee and Rep Lawrence now have a much more complete understanding of EPA's role in SDWA implementation and our activities in Flint over the past year or so. I would be happy to set up a call later today or tomorrow to provide you with more details.

Following the briefing, I did an in-depth interview with the MPR reporter who interviewed Peter last week. She also plans to do a story on the audit we announced today -- and I am about to do an interview about the audit with CBS in Detroit.

As we drive back to Chicago, I am also going to repeat some of the briefing I did this morning -- this time via phone for Senator Stabenow's environmental aide and LD and the LD from Senator Peters' Office.

After the briefing this morning, Rep Kildee said that his only remaining concern is whether we will be able to continue our current level of communication. To that end, I have asked the R5 legislative liaison for Michigan to set up a weekly call to brief congressional staff on EPA Task Force activities and other Flint-related matters so that they are kept in the loop.

Michigan's shoulder to make sure our drinking water is safe.

The EPA will audit the state's drinking water safety program after the state Department of Environmental Quality admitted it failed to use the correct protocols when it approved the switch to the Flint River as the primary source of drinking water for Flint.

That mistake led to dangerously high lead levels in that city's drinking water.

Flint's Democratic Congressman Dan Kildee joined us today to discuss the EPA's audit.

Listen

Listening...

10:24

Congressman Dan Kildee (D-MI) shares his thoughts on the Flint water crisis.

Kildee says it appears the EPA's audit of the MDEQ is the federal review that has the teeth that he's been looking for.

"It seems that there is incompetence, or mismanagement, or a lack of attention within the Department of Environmental Quality. They sort of have acknowledged that themselves in this case. That kind of failure has consequences. And they could be significant health consequences," says Kildee.

Kildee says he's not concerned about the EPA being complicit in the failings that occurred in Flint, saying the federal agency pushed the state for answers on whether or not a corrosion control program had been implemented.

The state initially replied that they did have a corrosion control program in place. That later turned out to not be true.

Kildee says the larger lesson in this is that people can't take a "bean counter" approach to managing cities. He says politicians who equate running a business with running a government are missing the point.

"You can bankrupt a business. You can disassemble a business. You can sell off the parts and put it away. Cities are human organisms. You can't just simply treat it as if,'well, you know what, we'll save money over here, and the balance sheet looks better.'"

The result of this decision, Kildee says, was "lead-laced water going into the bodies of children."

He says the Snyder administration looks at a lot of problems as “balance sheet problems,” and says that's why it failed in this case.

Hi Tinka,

It's not surprising to see high lead in 2015 from disturbances in 2014. We found high lead years after disturbances in the study we did here in Chicago as well. The disturbance knocks off the protective scale so even if the high lead-bearing scale/sediment is flushed out completely, you now have bare lead pipe exposed to the drinking water. The extent of the physical disturbance would dictate how much scale is knocked off so that can be highly variable. Another factor is how much orthophosphate is being used. Initially, public water systems feed a higher level of orthophosphate called the 'passivation dose' to initially coat the inside of the pipes, but after some time they typically reduce the amount of orthophosphate to what is called a 'maintenance dose' to maintain the coating that formed at the higher dosage. Depending on how much orthophosphate is being fed for the 'maintenance dose' at the treatment plant, it can take a long time to re-establish a sufficiently protective coating.

Hi Jeff, Thanks again for taking the time yesterday.

Just wanted to let you know I followed up with Consumers' Energy about the nat gas replacement work they did on Browning. Turns out it was done in August 2014. Does it seem weird that the lead levels were still that high at Lee Anne's home 6+ months later? Does that change any of the recommendation we talked about and that were in the report to the public about when they should flush their water lines for a long time? I don't know if you guys know or not. I just thought I'd bring to your attention considering I didn't have the info when we spoke yesterday.

Jeff – According to Miguel, it's not surprising to see high lead in 2015 from disturbances in 2014. We found high lead years after disturbances in the study we did here in Chicago as well. The disturbance knocks off the protective scale so even if the high lead-bearing scale/sediment is flushed out completely, you now have bare lead pipe exposed to the drinking water. The extent of the physical disturbance would dictate how much scale is knocked off so that can be highly variable. Another factor is how much orthophosphate is being used. In the case of Flint, we know that there was no orthophosphate being delivered to the Flint distribution system after the switch to Flint River water in April 2014. So, if there was a physical disturbance that knocked off the scale in the fall of 2014, the lack of CCT means that the scale would not have been restored.

Please let me know if you have other questions. Thanks

Earlier this week, I travelled to Flint to announce that EPA will be auditing the MDEQ drinking water program and to meet with Rep. Kildee and Rep. Lawrence. The audit announcement was well-received by the public, elected officials and MDEQ. Our two-hour meeting with Rep. Kildee and Rep. Lawrence included an in-depth briefing on EPA's work on Flint drinking water issues and a discussion with members of the EPA Flint Safe Drinking Water Task Force. At the end of the meeting, Rep. Kildee said his only remaining concern was making sure that there are opportunities for regular communication with EPA.

After the meeting, the Task Force toured the Flint drinking water plant and met with the Flint City Administrator. I went to the MPR studio in Lansing to do an interview with the reporter who interviewed Peter Grevatt last week. On the ride home, I did an hour-long conference call with Stabenow/Peters staffers to cover the same material that I discussed earlier in the day with Rep. Kildee and Rep. Lawrence.

We will be following up by holding weekly calls with interested congressional staff to brief them on the activities of the EPA Flint Safe Drinking Water Task Force. We will also be standing up a web page that includes information about the Task Force and information about steps to take to limit exposure to lead in drinking water. I am also preparing a written summary of the briefings I provided on Tuesday – in a format that can be distributed to congressional offices and potentially also included on the web page. We will be circulating drafts of all of these materials before they are posted or released.

Here are some recent clips about Flint:

---

http://www.mlive.com/news/flint/index.ssf/2015/11/epa_says_it_will_audit_michiga.html

By Ron Fonger | rfonger1@mlive.com
on November 10, 2015 at 1:43 PM

FLINT, MI -- In the wake of a public health crisis over high lead levels in water in some Flint homes, the U.S. Environmental Protection Agency has announced it will audit the state's drinking water program.

A Nov. 10 news release from the EPA says it will examine the Michigan Department of Environmental Quality's "implementation of the Safe Drinking Water Act and related rules on lead and copper, total coliform, nitrates and ground water."

The audit comes after requests for a federal investigation of Flint's water crisis by U.S. Rep. Dan Kildee, D-Flint, and state Senate Minority Leader Jim Ananich, D-Flint.

Brad Wurfel, a spokesman for the DEQ, issued a statement today, pledging the agency's cooperation.

"EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act," EPA Region 5 Administrator Susan Hedman said in a written statement.

"This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program."

The EPA news release says employees of the agency will go to MDEQ offices to review state files on public water system compliance with the SDWA and will review the state's oversight of public water systems.

"The audit will consist of a full programmatic review that supplements the reviews of the Michigan drinking water program that EPA conducts each year," the news release says.

The audit is expected to take several months to complete and a report will be issued when it is complete.

In separate letters to Gina McCarthy, administrator of the EPA, last month, Kildee and Ananich asked for the federal review of the MDEQ's oversight of water treatment in Flint.

A public health emergency was issued here after researchers from Virginia Tech university and a Hurley Medical Center doctor discovered high lead levels in Flint's water supply and rising blood lead levels in children since the city switched its water source from Lake Huron to the Flint River in April 2014.

DEQ Director Dan Wyant has said state regulators mistakenly allowed the city to distribute river water without requiring that it be treated to make it less corrosive.

Wurfel said in an email to The Flint Journal-MLive that the DEQ "welcomes this announcement from EPA, and we've already signaled to them that they can count on our full cooperation and transparency."

"We've appreciated the federal government's support on the situation in Flint --including its announcement last week that the Lead and Copper rule speaks ambiguously on the corrosion control issue," Wurfel's statement says.

"Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated – in Michigan, or anywhere else."

Ananich said the federal investigation would not have been necessary if an independent commission with subpoena power had been appointed by Gov. Rick Snyder.

Still, the senator said he's interested in the federal review.

"I want to see (EPA's findings)," he said. "I'm hoping it's thorough and of value."

For Immediate Release
november 11, 2015

WASHINGTON, D.C. – U.S. Senator Debbie Stabenow today issued the following statement regarding the Environmental Protection Agency's decision to audit the Michigan Department of Environmental Quality's drinking water program:

"It is clear that the State of Michigan made multiple mistakes and misjudgments, which have seriously harmed the health of the people of Flint. The EPA is taking critical steps today to get to the bottom of this outrageous situation. Everything must be done to make sure families and communities in Flint have safe drinking water."

###

http://michiganradio.org/post/congressman-kildee-says-hes-pleased-epa-will-review-michigans-drinking-water-program#stream/0

By stateside staff, nov. 12

The U.S. Environmental Protection Agency will be watching over the state of Michigan's shoulder to make sure our drinking water is safe.

The EPA will audit the state's drinking water safety program after the state Department of Environmental Quality admitted it failed to use the correct protocols when it approved the switch to the Flint River as the primary source of drinking water for Flint.

That mistake led to dangerously high lead levels in that city's drinking water.

Flint's Democratic Congressman Dan Kildee joined us today to discuss the EPA's audit.

Kildee says it appears the EPA's audit of the MDEQ is the federal review that has the teeth that he's been looking for.

"It seems that there is incompetence, or mismanagement, or a lack of attention within the Department of Environmental Quality. They sort of have acknowledged that themselves in this case. That kind of failure has consequences. And they could be significant health consequences," says Kildee.

Kildee says he's not concerned about the EPA being complicit in the failings that occurred in Flint, saying the federal agency pushed the state for answers on whether or not a corrosion control program had been implemented.

The state initially replied that they did have a corrosion control program in place. That later turned out to not be true.

Kildee says the larger lesson in this is that people can't take a "bean counter" approach to managing cities. He says politicians who equate running a business with running a government are missing the point.

"You can bankrupt a business. You can disassemble a business. You can sell off the parts and put it away. Cities are human organisms. You can't just simply treat it as if,'well, you know what, we'll save money over here, and the balance sheet looks better.'"

The result of this decision, Kildee says, was "lead-laced water going into the bodies of children."

He says the Snyder administration looks at a lot of problems as "balance sheet problems," and says that's why it failed in this case.

http://michiganradio.org/post/us-epa-will-audit-michigan-safe-drinking-water-program-wake-flints-problems

By Steve Carmody • 2 hours ago

A federal agency will review how the state of Michigan monitors local drinking water.

"What happened in Flint shouldn't have happened," says EPA Region 5 administrator Susan Hedman, who says as a result, "There is a lack of public confidence in the drinking water program here in Michigan."

Regional EPA administrator Susan Hedman says her agency will conduct an audit of the Michigan Department of Environmental Quality's drinking water program.

"EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act," Hedman said. "This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program."

MDEQ has been criticized for failing to detect problems with Flint's drinking water after the city switched to its namesake river last year.

During the 18 months that the city took its tap water from the Flint River, residents complained about the smell, taste and appearance of their drinking water. There were also E coli outbreaks and higher than acceptable levels of chemicals used to treat the water, as well as their by-products.

Researchers also claim the corrosiveness of the river water damaged pipes containing lead, in people's homes and in city transmission lines. The result was increasing levels of lead in the city's drinking water.

The MDEQ apparently failed to insure the city used proper corrosion controls to lessen the effect of the river water.

"What happened in Flint shouldn't have happened," says Hedman, who says as a result, "There is a lack of public confidence in the drinking water program here in Michigan."

A spokesman says the agency welcomes the EPA review of its drinking water program, adding EPA "can count on our full cooperation and transparency."

The written statement continues:

"We've appreciated the federal government's support on the situation in Flint – including its announcement last week that the Lead and Copper rule speaks ambiguously on the corrosion control issue. Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated – in Michigan, or anywhere else."

MDEQ officials say tests from nearly 400 homes and businesses in Flint indicate problems with lead are localized to individual buildings or even individual faucets.

http://www.wnem.com/story/30482668/us-regulators-will-audit-michigans-drinking-water-program#ixzz3r83XokM4

Posted: Nov 10, 2015 11:40 AM CST Updated: Nov 10, 2015 11:40 AM CST

By Carrie Widenmier

FLINT, MI (AP) - The federal government says it will conduct an audit of how the state of Michigan oversees public water supplies.

The audit announced Tuesday is in response to the water crisis in Flint. The city switched water sources in 2014, and the corrosive water released lead from old pipes.

Gov. Rick Snyder's Department of Environmental Quality acknowledges that drinking water rules were not followed when Flint made the switch to the Flint River. Flint now gets water from the Detroit system.

The EPA says it will investigate how Michigan enforces rules on lead, copper and nitrates and will identify ways to possibly strengthen state oversight.

The audit will take several months and will be released to the public.

Statement by Congressman Dan Kildee on the Announcement of the EPA's Audit of MDEQ

http://www.realestaterama.com/2015/11/11/statement-by-congressman-dan-kildee-on-the-announcement-of-the-epa%E2%80%99s-audit-of-mdeq-ID029750.html

November 11, 2015 by RealEstateRama

WASHINGTON, D.C. – November 11, 2015 – (RealEstateRama) — Congressman Dan Kildee (MI-05) issued the following statement after a meeting today with the Regional Administrator of the Environmental Protection Agency (EPA) who announced that the EPA will audit the Michigan Department of Environmental Quality's (MDEQ) drinking water program. Congressman Kildee previously called for a full review of the water problems in Flint.

"Today, I met with the EPA Region 5 Administrator, Susan Hedman, and the Flint Drinking Water Task Force to discuss her internal review of the EPA's oversight of MDEQ's handling of Flint's water. The people of Flint deserve answers, and I welcome the EPA's audit of the state's actions that led to the Flint water crisis. The EPA's audit and task force will hopefully begin to restore confidence among Flint residents regarding the safety of the water. "While this meeting was an important step forward and provided answers to a number of my concerns, it raised additional questions about the actions of MDEQ and other state officials, including the emergency financial manager, and the decisions they made that led to this crisis.

An audit is a critical next step that will help uncover the facts and ensure that the appropriate people are held accountable. "Later this month, I will testify at a meeting of the National Drinking Water Advisory Council on what we've learned firsthand in Flint and necessary improvements to the Lead and Copper Rule.

This will be an important moment to highlight the changes that are needed to ensure that a crisis like the one Flint faces does not occur anywhere else in the country."

---

http://www.freep.com/story/news/local/michigan/2015/11/10/drinking-water-audit-michigan/75522044/

John Wisely, Detroit Free Press 5:19 p.m. EST November 10, 2015

The U.S. Environmental Protection Agency will audit the state of Michigan's drinking water safety program in the wake of Flint's water crisis, which found lead in the city's water system.

The audit comes after the Michigan Department of Environment Quality admitted last month that it used the wrong protocols after it approved Flint's switch to the Flint River as its primary source of drinking water last year.

When high lead levels were detected in some Flint homes after the switch, experts concluded it was the result of corrosion in pipes caused by the new water. Flint was not adding corrosion-inhibiting chemicals to the water as the Detroit Water and Sewerage Department had done when it was supplying Flint.

"EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act," EPA Region 5 Administrator Susan Hedman said in a statement. "This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program."

Last month, the MDEQ removed the chief of the department's Office of Drinking Water and Municipal Assistance, Liane Shekter Smith. Gov. Rick Snyder appointed a task force to review the way the department handled the switch.

"MDEQ welcomes this announcement from EPA, and we've already signaled to them that they can count on our full cooperation and transparency," spokesman Brad Wurfel said.

He said the EPA's announcement last week that some rules are ambiguous on how communities must deal with lead and copper in their drinking water systems shows that reform is needed.

"Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated — in Michigan, or anywhere else," Wurfel said.

Flint resident Joe Castiglione, 75, said the audit is a good idea because the state's decisions should be reviewed by the federal government. Castiglione said he developed a rash all over his body after the city switched water sources.

"They didn't really check it before the switch," Castiglione said. "They said it was safe."

Last month, U.S. Rep. Dan Kildee, who represents Flint in Congress, and state Senate Minority Leader Jim Ananich, who represents the city in Lansing, asked the EPA to conduct an investigation. Ananich also has called for hearings in the state Legislature to examine MDEQ's conduct.

"This EPA review is an important part of the comprehensive examination that is necessary to get to the bottom of how this crisis occurred," Ananich said today in a statement. "I believe the EPA's feedback should be in addition to the legislative hearings I have repeatedly called for, since they admit that their audit could take several months ... and (they) will not have the subpoena power or public transparency that hearings would provide."

Hedman said the EPA every year monitors compliance with the Safe Drinking Water Act but the audit would bring added scrutiny, including visits to the MDEQ offices to review its files and an examination of the state's oversight of local drinking water systems.

In 2013, Flint voted to join Genesee County in building a new pipeline from Lake Huron as part of the Karegnondi Water Authority. The switch was approved by an emergency manager appointed by Snyder to fix Flint's finances.

The pipeline, however, does not come online until next year. Meantime, Flint left Detroit's water system, saying it was costing the city too much money, and began using the Flint River, which had been its backup supply. But the city never added phosphates to that water as Detroit had done. Phosphates form a film on the inside of pipes, helping keep lead and copper from leaching into the water.

Researchers from Virginia Tech tested the Flint River water and concluded it was 19 times more corrosive than the water Detroit was supplying.

After the lead was detected, the city and the state agreed to reconnect Flint to Detroit's water system until the new pipeline is completed. The switch back to Detroit water is expected to cost about $12 million over the next year, to be paid for by the city, the state and a grant from the C.S. Mott Foundation.

http://epnewswire.com/stories/510647596-michigan-finds-elevated-lead-levels-in-flint-elementary-school-some-homes

Wednesday, Nov 11, 2015 @ 11:44am By EP News Wire Reports

Testing by the Michigan Department of Environmental Quality (DEQ) found high levels of lead in nine faucets at the Freeman Elementary School in Flint, Michigan.

The test is part of an ongoing action plan to address the city's drinking water. The results were announced Monday.

"The safety and health of our students are our primary concern at Flint Community Schools, so we will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected," Flint Community Schools Superintendent Bilal Tawwab said. "Once those fixes have been made, the DEQ has offered to provide additional testing of the water at Freeman Elementary to ensure the water from every sample is safe for our students."

The DEQ tested 31 faucets at the school, and the nine with lead exposure showed decreased levels of lead after running for several minutes. The department also tested 381 homes, businesses and other facilities, 75 percent of which showed lead levels at five parts per billion or less. While many homes had negligible lead exposure, some did have elevated levels, so the DEQ is urging homeowners to take advantage of the free testing.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," DEQ Flint Action Plan Coordinator George Krisztian said. "Problems with lead exposure appear to be localized to individual service lines or plumbing fixtures, and we want to see all families in Flint take advantage of free water testing from the state."

Earlier this week, I travelled to Flint to announce that EPA will be auditing the MDEQ drinking water program and to meet with Rep. Kildee and Rep. Lawrence. The audit announcement was well-received by the public, elected officials and MDEQ. Our two-hour meeting with Rep. Kildee and Rep. Lawrence included an in-depth briefing on EPA's work on Flint drinking water issues and a discussion with members of the EPA Flint Safe Drinking Water Task Force. At the end of the meeting, Rep. Kildee said his only remaining concern was making sure that there are opportunities for regular communication with EPA.

After the meeting, the Task Force toured the Flint drinking water plant and met with the Flint City Administrator. I went to the MPR studio in Lansing to do an interview with the reporter who interviewed Peter Grevatt last week. On the ride home, I did an hour-long conference call with Stabenow/Peters staffers to cover the same material that I discussed earlier in the day with Rep. Kildee and Rep. Lawrence.

We will be following up by holding weekly calls with interested congressional staff to brief them on the activities of the EPA Flint Safe Drinking Water Task Force. We will also be standing up a web page that includes information about the Task Force and information about steps to take to limit exposure to lead in drinking water. I am also preparing a written summary of the briefings I provided on Tuesday – in a format that can be distributed to congressional offices and potentially also included on the web page. We will be circulating drafts of all of these materials before they are posted or released.

Here are some recent clips about Flint:

http://www.mlive.com/news/flint/index.ssf/2015/11/epa_says_it_will_audit_michiga.html

By Ron Fonger | rfonger1@mlive.com
on November 10, 2015 at 1:43 PM

FLINT, MI -- In the wake of a public health crisis over high lead levels in water in some Flint homes, the U.S. Environmental Protection Agency has announced it will audit the state's drinking water program.

A Nov. 10 news release from the EPA says it will examine the Michigan Department of Environmental Quality's "implementation of the Safe Drinking Water Act and related rules on lead and copper, total coliform, nitrates and ground water."

The audit comes after requests for a federal investigation of Flint's water crisis by U.S. Rep. Dan Kildee, D-Flint, and state Senate Minority Leader Jim Ananich, D-Flint.

Brad Wurfel, a spokesman for the DEQ, issued a statement today, pledging the agency's cooperation.

"EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act," EPA Region 5 Administrator Susan Hedman said in a written statement.

"This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program."

The EPA news release says employees of the agency will go to MDEQ offices to review state files on public water system compliance with the SDWA and will review the state's oversight of public water systems.

"The audit will consist of a full programmatic review that supplements the reviews of the Michigan drinking water program that EPA conducts each year," the news release says.

The audit is expected to take several months to complete and a report will be issued when it is complete.

In separate letters to Gina McCarthy, administrator of the EPA, last month, Kildee and Ananich asked for the federal review of the MDEQ's oversight of water treatment in Flint.

A public health emergency was issued here after researchers from Virginia Tech university and a Hurley Medical Center doctor discovered high lead levels in Flint's water supply and rising blood lead levels in children since the city switched its water source from Lake Huron to the Flint River in April 2014.

DEQ Director Dan Wyant has said state regulators mistakenly allowed the city to distribute river water without requiring that it be treated to make it less corrosive.

Wurfel said in an email to The Flint Journal-MLive that the DEQ "welcomes this announcement from EPA, and we've already signaled to them that they can count on our full cooperation and transparency."

"We've appreciated the federal government's support on the situation in Flint -- including its announcement last week that the Lead and Copper rule speaks ambiguously on the corrosion control issue," Wurfel's statement says.

"Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated – in Michigan, or anywhere else."

Ananich said the federal investigation would not have been necessary if an independent commission with subpoena power had been appointed by Gov. Rick Snyder.

Still, the senator said he's interested in the federal review.

"I want to see (EPA's findings)," he said. "I'm hoping it's thorough and of value."

For Immediate Release
november 11, 2015

WASHINGTON, D.C. – U.S. Senator Debbie Stabenow today issued the following statement regarding the Environmental Protection Agency's decision to audit the Michigan Department of Environmental Quality's drinking water program:

"It is clear that the State of Michigan made multiple mistakes and misjudgments, which have seriously harmed the health of the people of Flint. The EPA is taking critical steps today to get to the bottom of this outrageous situation. Everything must be done to make sure families and communities in Flint have safe drinking water."

http://michiganradio.org/post/congressman-kildee-says-hes-pleased-epa-will-review-michigans-drinking-water-program#stream/0

By stateside staff, nov. 12

The U.S. Environmental Protection Agency will be watching over the state of Michigan's shoulder to make sure our drinking water is safe.

The EPA will audit the state's drinking water safety program after the state Department of Environmental Quality admitted it failed to use the correct protocols when it approved the switch to the Flint River as the primary source of drinking water for Flint.

That mistake led to dangerously high lead levels in that city's drinking water.

Flint's Democratic Congressman Dan Kildee joined us today to discuss the EPA's audit.

Kildee says it appears the EPA's audit of the MDEQ is the federal review that has the teeth that he's been looking for.

“It seems that there is incompetence, or mismanagement, or a lack of attention within the Department of Environmental Quality. They sort of have acknowledged that themselves in this case. That kind of failure has consequences. And they could be significant health consequences,” says Kildee.

Kildee says he’s not concerned about the EPA being complicit in the failings that occurred in Flint, saying the federal agency pushed the state for answers on whether or not a corrosion control program had been implemented.

The state initially replied that they did have a corrosion control program in place. That later turned out to not be true.

Kildee says the larger lesson in this is that people can’t take a “bean counter” approach to managing cities. He says politicians who equate running a business with running a government are missing the point.

“You can bankrupt a business. You can disassemble a business. You can sell off the parts and put it away. Cities are human organisms. You can’t just simply treat it as if,’well, you know what, we’ll save money over here, and the balance sheet looks better.’”

The result of this decision, Kildee says, was “lead-laced water going into the bodies of children.”

He says the Snyder administration looks at a lot of problems as “balance sheet problems,” and says that's why it failed in this case.

http://michiganradio.org/post/us-epa-will-audit-michigan-safe-drinking-water-program-wake-flints-problems

By Steve Carmody • 2 hours ago

A federal agency will review how the state of Michigan monitors local drinking water.

“What happened in Flint shouldn’t have happened," says EPA Region 5 administrator Susan Hedman, who says as a result, "There is a lack of public confidence in the drinking water program here in Michigan.”

Regional EPA administrator Susan Hedman says her agency will conduct an audit of the Michigan Department of Environmental Quality’s drinking water program.

“EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act,” Hedman said. “This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program.”

MDEQ has been criticized for failing to detect problems with Flint’s drinking water after the city switched to its namesake river last year.

During the 18 months that the city took its tap water from the Flint River, residents complained about the smell, taste and appearance of their drinking water. There were also E coli outbreaks and higher than acceptable levels of chemicals used to treat the water, as well as their by-products.

Researchers also claim the corrosiveness of the river water damaged pipes containing lead, in people’s homes and in city transmission lines. The result was increasing levels of lead in the city’s drinking water.

The MDEQ apparently failed to insure the city used proper corrosion controls to lessen the effect of the river water.

“What happened in Flint shouldn’t have happened," says Hedman, who says as a result, "There is a lack of public confidence in the drinking water program here in Michigan.”

A spokesman says the agency welcomes the EPA review of its drinking water program, adding EPA “can count on our full cooperation and transparency.”

The written statement continues:

“We’ve appreciated the federal government’s support on the situation in Flint – including its announcement last week that the Lead and Copper rule speaks ambiguously on the corrosion control issue. Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated – in Michigan, or anywhere else."

MDEQ officials say tests from nearly 400 homes and businesses in Flint indicate problems with lead are localized to individual buildings or even individual faucets.

By Carrie Widenmier

FLINT, MI (AP) - The federal government says it will conduct an audit of how the state of Michigan oversees public water supplies.

The audit announced Tuesday is in response to the water crisis in Flint. The city switched water sources in 2014, and the corrosive water released lead from old pipes.

Gov. Rick Snyder's Department of Environmental Quality acknowledges that drinking water rules were not followed when Flint made the switch to the Flint River. Flint now gets water from the Detroit system.

The EPA says it will investigate how Michigan enforces rules on lead, copper and nitrates and will identify ways to possibly strengthen state oversight.

The audit will take several months and will be released to the public.

Statement by Congressman Dan Kildee on the Announcement of the EPA's Audit of MDEQ

http://www.realestaterama.com/2015/11/11/statement-by-congressman-dan-kildee-on-the-announcement-of-the-epa%E2%80%99s-audit-of-mdeq-ID029750.html

November 11, 2015 by RealEstateRama

WASHINGTON, D.C. – November 11, 2015 – (RealEstateRama) — Congressman Dan Kildee (MI-05) issued the following statement after a meeting today with the Regional Administrator of the Environmental Protection Agency (EPA) who announced that the EPA will audit the Michigan Department of Environmental Quality's (MDEQ) drinking water program. Congressman Kildee previously called for a full review of the water problems in Flint.

"Today, I met with the EPA Region 5 Administrator, Susan Hedman, and the Flint Drinking Water Task Force to discuss her internal review of the EPA's oversight of MDEQ's handling of Flint's water. The people of Flint deserve answers, and I welcome the EPA's audit of the state's actions that led to the Flint water crisis. The EPA's audit and task force will hopefully begin to restore confidence among Flint residents regarding the safety of the water. "While this meeting was an important step forward and provided answers to a number of my concerns, it raised additional questions about the actions of MDEQ and other state officials, including the emergency financial manager, and the decisions they made that led to this crisis.

An audit is a critical next step that will help uncover the facts and ensure that the appropriate people are held accountable. "Later this month, I will testify at a meeting of the National Drinking Water Advisory Council on what we've learned firsthand in Flint and necessary improvements to the Lead and Copper Rule.

This will be an important moment to highlight the changes that are needed to ensure that a crisis like the one Flint faces does not occur anywhere else in the country."

http://www.freep.com/story/news/local/michigan/2015/11/10/drinking-water-audit-michigan/75522044/

John Wisely, Detroit Free Press 5:19 p.m. EST November 10, 2015

The U.S. Environmental Protection Agency will audit the state of Michigan's drinking water safety program in the wake of Flint's water crisis, which found lead in the city's water system.

The audit comes after the Michigan Department of Environment Quality admitted last month that it used the wrong protocols after it approved Flint's switch to the Flint River as its primary source of drinking water last year.

When high lead levels were detected in some Flint homes after the switch, experts concluded it was the result of corrosion in pipes caused by the new water. Flint was not adding corrosion-inhibiting chemicals to the water as the Detroit Water and Sewerage Department had done when it was supplying Flint.

"EPA is conducting this audit to ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act," EPA Region 5 Administrator Susan Hedman said in a statement. "This comprehensive audit will provide Flint residents and the people of Michigan with more information about MDEQ oversight of public water supplies and will identify actions that may be needed to strengthen the Michigan drinking water program."

Last month, the MDEQ removed the chief of the department's Office of Drinking Water and Municipal Assistance, Liane Shekter Smith. Gov. Rick Snyder appointed a task force to review the way the department handled the switch.

"MDEQ welcomes this announcement from EPA, and we've already signaled to them that they can count on our full cooperation and transparency," spokesman Brad Wurfel said.

He said the EPA's announcement last week that some rules are ambiguous on how communities must deal with lead and copper in their drinking water systems shows that reform is needed.

"Nobody wants to see a situation like Flint, and we look forward in working with our federal partners going forward because we share the goal of making sure the Flint situation is not repeated — in Michigan, or anywhere else," Wurfel said.

Flint resident Joe Castiglione, 75, said the audit is a good idea because the state's decisions should be reviewed by the federal government. Castiglione said he developed a rash all over his body after the city switched water sources.

"They didn't really check it before the switch," Castiglione said. "They said it was safe."

Last month, U.S. Rep. Dan Kildee, who represents Flint in Congress, and state Senate Minority Leader Jim Ananich, who represents the city in Lansing, asked the EPA to conduct an investigation. Ananich also has called for hearings in the state Legislature to examine MDEQ's conduct.

"This EPA review is an important part of the comprehensive examination that is necessary to get to the bottom of how this crisis occurred," Ananich said today in a statement. "I believe the EPA's feedback should be in addition to the legislative hearings I have repeatedly called for, since they admit that their audit could take several months ... and (they) will not have the subpoena power or public transparency that hearings would provide."

Hedman said the EPA every year monitors compliance with the Safe Drinking Water Act but the audit would bring added scrutiny, including visits to the MDEQ offices to review its files and an examination of the state's oversight of local drinking water systems.

In 2013, Flint voted to join Genesee County in building a new pipeline from Lake Huron as part of the Karegnondi Water Authority. The switch was approved by an emergency manager appointed by Snyder to fix Flint's finances.

The pipeline, however, does not come online until next year. Meantime, Flint left Detroit's water system, saying it was costing the city too much money, and began using the Flint River, which had been its backup supply. But the city never added phosphates to that water as Detroit had done. Phosphates form a film on the inside of pipes, helping keep lead and copper from leaching into the water.

Researchers from Virginia Tech tested the Flint River water and concluded it was 19 times more corrosive than the water Detroit was supplying.

After the lead was detected, the city and the state agreed to reconnect Flint to Detroit's water system until the new pipeline is completed. The switch back to Detroit water is expected to cost about $12 million over the next year, to be paid for by the city, the state and a grant from the C.S. Mott Foundation.

http://epnewswire.com/stories/510647596-michigan-finds-elevated-lead-levels-in-flint-elementary-school-some-homes

Wednesday, Nov 11, 2015 @ 11:44am By EP News Wire Reports

Testing by the Michigan Department of Environmental Quality (DEQ) found high levels of lead in nine faucets at the Freeman Elementary School in Flint, Michigan.

The test is part of an ongoing action plan to address the city's drinking water. The results were announced Monday.

"The safety and health of our students are our primary concern at Flint Community Schools, so we will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected," Flint Community Schools Superintendent Bilal Tawwab said. "Once those fixes have been made, the DEQ has offered to provide additional testing of the water at Freeman Elementary to ensure the water from every sample is safe for our students."

The DEQ tested 31 faucets at the school, and the nine with lead exposure showed decreased levels of lead after running for several minutes. The department also tested 381 homes, businesses and other facilities, 75 percent of which showed lead levels at five parts per billion or less. While many homes had negligible lead exposure, some did have elevated levels, so the DEQ is urging homeowners to take advantage of the free testing.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," DEQ Flint Action Plan Coordinator George Krisztian said. "Problems with lead exposure appear to be localized to individual service lines or plumbing fixtures, and we want to see all families in Flint take advantage of free water testing from the state."

Full investigation needed at every level in Flint water crisis

Flint Journal, The (MI) - Sunday, November 15, 2015

Readability: *>12 grade level (Lexile: 1390L)*

URL:
http://www.mlive.com/opinion/flint/index.ssf/2015/11/full_investigation_needed_at_e.html

By U.S. Rep. Dan Kildee

It's clear that the Flint water crisis was a failure of government. Residents are rightfully angry, and I'm angry over the lack of immediate action to address unsafe lead levels in the city's water.

Despite independent research showing elevated lead levels, the Michigan Department of **Environmental** Quality and U.S. **Environmental Protection Agency** stalled for weeks, saying there was no cause for concern and denying there was even a problem.

Now, state officials have admitted that drinking-water laws were not followed. Yet inaction by officials has caused considerable harm. The people of Flint are victims of this failure of government, and there needs to be accountability.

That's why I've called for a thorough investigation into the water problems in Flint. And that's why I continue to stress that both the MDEQ and EPA act in an urgent manner to address this public health crisis.

A complete review of actions at every level will result in answers and transparency, and hopefully it will begin to restore public confidence for Flint residents.

It will also ensure that we take steps to make sure this never happens again, in Flint or in other cities.

Residents deserve to know why for months the state of Michigan failed to follow federal laws. They also deserve to know why corrosion control treatments were not in place when the city's water supply switched to the Flint River.

Additionally, I continue to advocate for long-term solutions to improve Flint's water infrastructure. Lead-clearing filters, bottled water and even reconnecting to the Detroit water system are critical steps, but they won't solve the problem. Flint River water has caused extensive damage to the city's aged infrastructure, and major investments are needed to make repairs.

I have been advocating for the state and EPA to forgive Flint's federal Safe Drinking Water loans to free up money to make it possible for Flint to make system improvements -- including replacement of lead service lines.

Both the state and federal government have to take responsibility and act.

Flint is a financially distressed city that simply doesn't have the money to pay for water improvements made necessary by the state's very costly and ill-thought-out decision.

Simply put, Flint should not have to foot the bill for the state and EPA's mistakes.

To exacerbate the crisis, the state has cut tens of millions of dollars in revenue sharing in recent years. This money could have helped to make critical infrastructure improvements.

Now as a result, Flint -- and a whole subset of older, industrial American cities -- stand to be left behind in the new economy if we don't make critical investments.

Access to safe drinking water is a fundamental right. Having a water system that delivers clean drinking water to our schools and children is not up for debate.

Under the law, it is the responsibility of the state and federal government to ensure safe drinking water.

And the very agencies of government charged with protecting public health failed to do that.

The state and federal government both need to act to fix the problems created by the failed policies that led to this crisis. Neither has an excuse not to.

-- Dan Kildee, D-Flint Township, represents Michigan's 5th Congressional District.

Tom- Below is a link to the web page that I would like you to review and work with Anne (and Allison) on tomorrow. I shared the language you provided earlier and as we looked at the web page we thought it may make more sense to eliminate the reference to flushing, except to say that normally we recommend flushing but given that ……..Corrosion control treatment has been reintroduced with Flint's recent return to water from the Great Lakes Water Authority. The protective scales within the service lines are being built up and the stability of this growing scale is hard to know throughout the water system. EPA recommends that all residents (do we want to say particularly pregnant women, infants and children) use only bottled water or water that is filtered through a water filter that is certified to remove 'total lead' for drinking, cooking and making baby formula until further notice.

The concern is that there is a lot of language on flushing that may cause confusion. Please let me know what you think. I believe the goal is to stand the web page on Wed. Thanks

By Ron Fonger | rfonger1@mlive.com
on November 17, 2015 at 5:50 AM, updated November 17, 2015 at 10:49 AM

FLINT, MI -- Michigan's senior U.S. senator says Flint needs its water problems fixed and questions answered, but also needs to get lead-exposed children better access to good nutrition.

"This whole thing is deeply, deeply concerning," U.S. Sen. Debbie Stabenow said about Flint's water emergency. "I am glad the EPA is coming in with an extensive audit."

The senator said in addition to addressing issues about how the city's lead in water problems arose and the state's responsibility for fixing them, she's working on improving nutrition for children to combat exposure to lead.

Stabenow said the Women Infants and Children program in Genesee County is making pre-mixed infant formula available to city residents enrolled in the program.

Mark Valacak of the Genesee County Health Department said the department has been authorized to provide the formula, which is available to women enrolled in the program at the clinic if they request it.

This whole thing is deeply, deeply concerning.

Stabenow said Dr. Mona Hanna-Attisha told her the most important way parents can combat the ill-effects of lead exposure is through better nutrition.

Hanna-Attisha's study on rising blood lead levels in children after the city changed its water source to the Flint River in April 2014 helped bring an end to the use of the river and a reconnection to the Detroit water system.

The U.S. Department of Agriculture has agreed to make ready-to-use formula available through WIC so that mothers don't have to mix powdered formula with water.

Although the city water system is using Detroit water, the U.S. Environmental Protection Agency warned just last week that residents should be warned of the potential risk of increased lead in drinking water when crews do underground work that could dislodge scale and sediment in water pipes here.

Stabenow encouraged parents use the Double Up food program, which is expanding to supermarkets, and said she's prepared to work with others to help interested investors open a full-service grocery store on Flint's north side.

The most recent Farm Bill provides for assistance for investors interested in opening grocery stores in under-served areas, she said.

http://www.businessinsider.com/flints-drinking-water-is-contaminated-with-lead-2015-11

The drinking water in Flint, Michigan is contaminated with lead.

And the city may be at fault. The Natural Resources Defense Council (NRDC) alleges that officials there knew about the risks of shifting the city's water supply from Detroit's Lake Huron to the Flint River, but did so anyway — ostensibly to cut costs.

This morning, Flint residents, along with NRDC and the American Civil Liberties Union (ACLU), announced their intent to sue Michigan state and local municipal officials for allegedly violating the federal Safe Drinking Water Act.

The problem likely began with Michigan's inland rivers and lakes, which contain far higher amounts of chloride ions than the Great Lakes, thanks to copious amounts of road salt applied to nearby roads.

When that salty water is pumped into the city's aging infrastructure, it corrodes the pipes, leaching lead into the drinking water.

Residents began to complain about the smell and discoloration of the water soon after the city started drawing water from the Flint River over a year and a half ago, but these complaints were written off by state officials for months, the NRDC alleges.

Drinking water laced with lead ends up in your blood, and that's where it starts to cause problems. Even at extremely low concentrations (the CDC says 5 micgrograms per deciliter is enough to cause concern), lead in blood has been linked with a range of deleterious behavioral and mental health impacts. In young children, exposure to lead in drinking water at these levels can delay mental and physical development and affect attention span and learning, according to the EPA. In adults, it can raise blood pressure and, in the long term, can lead to kidney problems.

The EPA limits the amount of lead allowed in drinking water at 15 parts-per-billion, but states that there is really no safe level. In other words, the EPA's goal is to have no lead at all in drinking water supply, but it will tolerate up to 15 parts-per-billion.

A Virginia Tech study from last summer found that 40.1% of water samples from Flint homes contained over 5 parts-per-billion of lead. The researchers also reported that the 90th percentile lead level in Flint homes was 25.2 parts-per-billion — well over the EPA's reccomendation.

A study by a local pediatrician also found that the proportion of Flint children under the age of five with elevated lead blood levels had doubled since the city switched its water sources.

The NRDC asserts that, since April 2014, officials in the city of Flint and the state of Michigan failed to adequately monitor and control for lead in Flint’s drinking water, and maintain a program to assist Michigan schools with lead testing and remediation — amounting to clear violations of the federal Safe Drinking Water Act.

APMichigan Governor Rick Snyder

If government officials, including Governor Rick Snyder and Department of Environmental Quality Dan Snyder don't address the violations within the next sixty days, they'll be sued in a federal court.

Business Insider has reached out to the representative from the city of Flint and the state of Michigan and will update the story when we recieve a comment.

"We’re focused on moving forward and ensuring public health and clean, safe drinking water. The governor has outlined a detailed multiple step action plan for both immediate, mid and long term. He has also appointed a task force doing a very important job of reviewing all past actions. They are a bipartisan group of people of the highest integrity, experts in their fields and widely respected who are going to do a very thorough, objective review."

Flint Department of Public Works Director Howard Croft is shown in this Flint Journal file photo.Flint Journal file photo

FLINT, MI — Howard Croft, the department head responsible for oversight of Flint water operations, has resigned his position effective immediately.

Croft, in a letter to City Administrator Natasha Henderson on Monday, Nov. 16, said he is leaving his position at the city Department of Public Works to regain public trust following a lead-in-water crisis.

"It is with deep sadness that I tender my immediate resignation" as public works director, the letter says. "With the city engaged in transition and working to regain public trust, I believe that now is the right time for me to step down from this position."

Croft, a lifelong resident of Flint, has been in charge of the city's DPW operations since he was appointed to the position by former emergency manager Mike Brown in December 2011.

After his hiring, Croft said he would emphasize responsibility among those who worked for him.

"The one word we are going to try and push for is accountability," Croft said nearly four years ago. "That goes for every employee, accountability for every employee."

The DPW is responsible for Flint's utilities and transportation divisions, but Croft's oversight of city-owned facilities, specifically the drinking water division, put him in the center of what has become a public health emergency because of rising levels of lead in city drinking water.

The city began using the Flint River as its source of drinking water in April 2014, and Croft defended the quality and safety of the water even as the city struggled with bacteria, total trihalomethanes (TTHM) and lead levels.

Faced with mounting evidence of rising lead levels in Flint's drinking water, the city abandoned its use of the river last month, reconnecting to the Detroit water system until the completion of the Karegnondi Water Authority pipeline, which is expected in 2016.

Croft inherited an aging water distribution system that was built to serve twice as many residents as it does now and which was prone to transmission line breaks, leaks and broken valves.

In an email to Mayor Karen Weaver and the City Council, Henderson said Croft will consult the city on an interim basis "as we recruit for a new public works director to make this as seamless as possible."

"Mr. Croft will be missed as he transitions from the director position. ... He has made valuable contributions during his time with the city, and I truly thank him for his service," Henderson's email says.

Weaver said the city will "do what we need to do to have a qualified person in place" to replace Croft.

"I definitely will be having input," she said.

Sworn into office just last week after her election Nov. 3, Weaver has said she expects Henderson to respect her wishes on executive appointments.

Although the city charter gives the mayor the authority to appoint an executive staff, an emergency manager order signed in April transferred that authority to the city administrator.

Croft's letter of resignation says he made every effort to serve with honesty, dignity and integrity.

"I am proud of the many accomplishments that I have been a part of over the years," including assisting in the development of a 50-year master plan, a multi-year capital improvement plan and a prioritized plan to deal with aging infrastructure.

Croft praised DPW employees, "who by no fault of their own have encountered drastic changes in staffing, equipment, and work environment, yet they continue to provide daily services to the absolute best of their ability."

Researchers at Virginia Tech received samples of Flint water (both clear and discolored) from residents.

Credit Flint Water Study / Facebook

The Flint water crisis will be part of a public meeting this week in Virginia about federal rules on lead.

The National Drinking Water Advisory Council is holding meetings tomorrow through Thursday to develop recommendations for the Environmental Protection Agency.

The EPA is working on changing its rules on lead and copper in water. Those rules have been scrutinized lately because of Flint's problems with lead in drinking water.

Congressman Dan Kildee (D-Flint) will testify.

Lee Anne Walters also plans to speak at the meeting. Her four-year-old son had elevated lead levels in his blood after Flint started using the Flint River as a water source.

"I want the loopholes for the lead and copper rule out. I'm not going to stop until that happens."

Walters and other critics say there are problems with the rules that can skew the outcome of water tests.

A spokesman with the Michigan Department of Environmental Quality says the agency is reviewing its water testing protocols.

http://www.mlive.com/news/flint/index.ssf/2015/11/class_action_lawsuit_claims_sn.html

By Ron Fonger | rfonger1@mlive.com
on November 16, 2015 at 4:24 PM, updated November 16, 2015 at 7:22 PM

FLINT -- City and state officials supplied highly toxic water to Flint residents solely because it was the cheaper option, attorneys seeking a class action lawsuit claimed in a news conference today, Nov. 16.

The lawsuit, filed in U.S. District Court in Detroit on Friday, Nov. 13, claims 14 officials, including Gov. Rick Snyder and former mayor Dayne Walling, are responsible for replacing safe water in Flint with water that was "dangerous, unsafe and ... inadequately treated."

The lawsuit seeks an order certifying it as a class action, an order declaring the conduct of the 14 officials unconstitutional, an order that includes the establishment of a medical monitoring fund, appointment of a monitor to oversee Flint water operations, compensatory and punitive damages, and attorney fees.

"Defendants' conduct in exposing Flint residents to toxic water was so egregious and so outrageous that it shocks the conscience ...," the lawsuit says. "For more than 18 months, state and local government officials ignored irrefutable evidence that the water pumped from the Flint River exposed (users) to extreme toxicity ..."

Sara Wurfel, a spokeswoman for Snyder, said state officials have not been served with the lawsuit and would not comment on details of it.

"What (we) would say is that we're focused on moving forward and ensuring public health and clean, safe drinking water," Wurfel said in an email to The Flint Journal-MLive. "The governor has outlined a detailed multiple step action plan for both immediate, mid and long term.

"He has also appointed a task force doing a very important job of reviewing all past actions. They are a bipartisan group of people of the highest integrity, experts in their fields and widely respected who are going to do a very thorough, objective review."

Residents and their attorneys said, however, that they've suffered health and property damages since the city changed its water source to the Flint River in April 2014 without proper treatment to make it less corrosive.

Water samples collected by the city and tested by the state showed a spike in lead level immediately after the change, and independent testing by researchers from Virginia Tech university showed even higher lead levels -- beyond limits that trigger action by the U.S. Environmental Protection Agency.

William Goodman, a partner in Goodman & Hurwitz, one of three law firms representing Flint families in the U.S. District Court lawsuit, said state and local officials are responsible for lower property values, damage to plumbing, and injuries ranging from hair loss to neurological disorders because of the water they drank, cooked with and bathed in.

"Governmental immunity does not trump the Constitution of the United States," Goodman said "We believe we are in a very powerful position, (and) we should prevail."

Also in the 30-page lawsuit:

State officials have been sued because they made the final decision that "deliberately created, increased and prolonged the hazards, threats and dangers that arose by replacing of a safe drinking, washing and bathing water with a highly toxic alternative."

Two former Flint emergency managers -- Darnell Earley and Jerry Ambrose -- are named as defendants.

State and local officials were "fully aware that the required and necessary anti-corrosive was not being used" to treat Flint River water -- something experts have said caused lead to leach from underground pipes and home plumbing.

The number of injured individuals who have been harmed by exposure to Flint water numbers "tens of thousands."

Michael Pitt, a partner in Pitt McGehee Palmer & Rivers, another of the law firms involved in the case, said state and city officials have shown themselves unwilling to act until they have been forced.

"When the government creates the danger, they become responsible ... It's the government that created this ...," Pitts said. "The state has been in denial about this. It's going to take this lawsuit to shake them out of their stupor."

Flint residents who have filed the lawsuit are Melissa and Michael Mays, Jacqueline and John Pemberton, Elnora Carthan and Rhonda Kelso.

In addition to Snyder, Walling and the emergency managers, the lawsuit names defendants Dan Wyant, director of the state Department of Environmental Quality; Liane Shekter, Adam Rosenthal, Stephen Busch, Patrick Cook, Michael Prysby and Brad Wurfel, all of the DEQ; Flint Department of Public Works Director Howard Croft, Flint Utilities Administrator Michael Glasgow and Daughtery Johnson, former city utilities administrator.

The potential class action lawsuit was filed just three days before an unrelated notice of intent to sue, which was filed today by the American Civil Liberties Union of Michigan, the Natural Resources Defense Council, the Concerned Pastors for Social Action and Flint resident Melissa Mays.

A "short-sighted effort to save a buck" poisoned the city's water.

Arthur Delaney Senior Reporter, The Huffington Post

Posted: 11/16/2015 12:28 PM EST | Edited: 11/16/2015 05:18 PM EST

Residents of Flint, Michigan, are suing over dangerous lead levels in their tap water resulting from state and local efforts to save money by switching the city's water supply last year.

"In their short-sighted effort to save a buck, the leaders who were supposed to be protecting Flint's citizens instead left them exposed to dangerously high levels of lead contamination," Michael Steinberg, legal director for the ACLU of Michigan, said in a release. The ACLU, along with the National Resources Defense Council, a national nonprofit that advocates on environmental issues, on Monday filed a notice of intent to sue the city and state.

Several Flint families last week filed a separate lawsuit against local and state governments seeking class-action status in federal court. Lead poisoning, whether from water or paint chips, can cause physical and permanent neurological harm. Children are particularly vulnerable.

Last year, Flint officials and an emergency manager appointed by Michigan Gov. Rick Snyder (R) switched the city's water supply from Detroit's system to the Flint River. The Michigan Department of Environmental Quality admitted last month that it had failed to implement proper corrosion controls, and the new water wound up leaching dangerous amounts of lead from city pipes.

"Not only were the city and state's actions dangerous and misguided, they were illegal, too," Steinberg said.

Despite complaints from residents and reports that the water had high lead levels, local and state officials denied there was a problem -- until a local pediatrician documented a spike in blood lead levels among Flint children, prompting the city to switch back to Detroit's water.

"This action is about holding the government accountable for failing to protect the public health of an entire community," Anjali Waikar, an attorney with the NRDC, said in a statement. "This case also highlights a troubling trend in which the government is willing to turn a blind eye when it comes to protecting the lives of poor, black people."

The NRDC and ACLU said the state is still failing to follow water-testing protocols set forth by the federal Safe Drinking Water Act, and that they'll file their suit in 60 days if Snyder and other officials don't remedy these violations.

Sara Wurfel, a spokeswoman for Snyder, declined to comment on the lawsuits but defended the governor's response to the crisis, noting he has appointed a task force to figure what went wrong.

"The governor has outlined a detailed multiple-step action plan for both immediate, mid and long term," Wurfel said. "He has also appointed a task force doing a very important job of reviewing all past actions. They are a bipartisan group of people of the highest integrity, experts in their fields and widely respected who are going to do a very thorough, objective review."

Marc Edwards, a Virginia Tech University civil engineering professor, helped expose the high lead levels in Flint's water.

"My heart goes out them, and I wish them the best in trying to hold agencies accountable for the irreparable damage done to Flint's innocent children," Edwards said, noting that similar efforts to hold officials in Washington, D.C., accountable for toxic water have not yet succeeded.

HuffPost readers: Do you live in Flint? Do you have children younger than 6 and concerns about the water? Tell us about it -- email arthur@huffingtonpost.com. Please include your phone number if you're willing to be interviewed.

This article has been updated to include comment from Snyder's office.

http://www.detroitnews.com/story/news/local/michigan/2015/11/17/flint-utility-official-resigns-amid-water-controversy/75920332/

Jim Lynch, The Detroit News 9:50 a.m. EST November 17, 2015

Flint's top utility official has resigned his post as the city continues to deal with fall-out from its drinking water crisis.

A city spokesman confirmed Howard Croft has stepped down as director of public works this week. It's a post he has held since late-2011, involving oversight of Flint's water treatment and distribution.

The quality of the drinking water has been a controversial issue since the city began drawing it from the Flint River in the spring of 2014 as a cost-saving measure. A failure to treat that water with proper corrosion controls, coupled with aging lead-connection lines around the city, resulted in widespread lead contamination.

"(Croft) believed it was the right time for him to step down due to the issues with water," said Jason Lorenz, Flint's public information officer.

City and state officials linked to the switch from water provided by the Detroit Water and Sewerage Department to the Flint River have been under intense scrutiny since the decision was made. Two lawsuits targeting those officials over their handling of the situation were filed this week.

"This action is about holding the government accountable for failing to protect the public health of an entire community," said Anjali Waikar, an attorney at the Natural Resources Defense Council, a plaintiff in one of the suits. "This case also highlights a troubling trend in which the government is willing to cut costs at the expense of its most vulnerable citizens."

Lorenz declined to comment on the lawsuits Tuesday, saying the city had not yet been served in the matters.

http://michiganradio.org/post/attorneys-discuss-flint-water-class-action-lawsuit

By Steve Carmody • 20 hours ago

ShareTwitter Facebook Google+ Email

Attorneys are hoping to sign up tens of thousands of Flint water customers for a class action lawsuit against the city and state.

"They are well protected…but not absolutely," says attorney Michael Pitt.

The suit was filed Friday on behalf of four families.

Attorney Trachelle Young says they are seeking damages for people suffering health problems because of Flint's problem-plagued drinking water.

"I don't think the community has any idea how truly extensive the damages are," says Young.

For 18 months, starting in April of 2014, the city of Flint got its tap water from its namesake river. But shortly after the switch, Flint residents complained about the water's taste, smell, and appearance.

People say the water burned their skin and made their hair fall out. There were also E coli outbreaks and higher than acceptable levels of chemicals in the water.

"I don't think the community has any idea how truly extensive the damages are," says attorney Trachelle Young.

Tests have also shown high levels of lead in the water.

Researchers from Virginia Tech blame the lead problem on the corrosive Flint River.

Water from the river apparently damaged lead and iron pipes in Flint's water system.

The city switched back to Detroit water last month, but people continue to claim health problems.

The class action lawsuit does not seek specific monetary damages, but it could cost tens of millions of dollars.

Michael Pitt is part of the legal team handling the class action lawsuit. His legal firm has handled class action suits against the Michigan Department of Corrections in the past.

Pitt concedes it's difficult to sue the government because of immunity provisions in the law.

"They are well protected…but not absolutely," says Pitt.

A class action lawsuit may be a long process.

The suit filed last week will likely not be certified by the federal court as a "class action" until next year.

After that, there will likely be a protracted legal fight.

Still, the attorneys handling the case are optimistic their clients will win, either in the courts, or by the city and state governments accepting liability.

A Flint city spokesman had no comment on the lawsuit.

---

http://msutoday.msu.edu/news/2015/msu-to-host-panel-on-flint-water-crisis/

Contact(s): Galena Ostipow

From 6 to 8 p.m. Nov. 18 in 303 International Center, Michigan State University will host a panel to discuss the Flint water crisis, featuring experts in environmental history and water access and quality, along with two of the major Flint community organizers advocating safe water for Flint residents.

In March 2013, the Flint city council voted to switch from Detroit water to join the Karegnondi Water Authority, a pipeline project designed to deliver water from Lake Huron. When that project was delayed, the Flint River was designated as the new water source.

The switch was completed in April 2014, and serious questions about the water's safety began to surface. Following resistance from city and state representatives to address the issue, activists Melissa Mays and Claire McClinton helped lead the movement to advocate for EPA intervention and safe drinking water for Flint residents.

The panel will include:

Jennifer Carrera (Department of Sociology/Environmental Science and Policy Program) is part of the MSU campus-wide Global Water Initiative. Her research focuses on environmental justice issues of access to clean water and sanitation in low-income communities domestically and internationally.

Sara Fingal (Department of History/Lyman Briggs College) specializes in environmental history, 20th century U.S. history, the history of coastal zone management, water resources, environmental politics, policy and planning and U.S. social movements.

Susan Masten (Department of Civil and Environmental Engineering) researches chemical agents to treat soil and water contaminated with hazardous organic chemicals. She has been working extensively to develop water treatment technologies that are more effective and suitable for use in decentralized water treatment systems. She's currently conducting research on Flint water samples for disinfection byproducts.

Melissa Mays is a founder of the citizen advocacy group Water You Fighting For. In August of 2015, WYFF distributed 300 test kits to households and worked with a volunteer team of research scientists and graduate students to determine if there were toxic lead concentrations in the city water supply.

Claire McClinton is a community activist advocating for safe drinking water for Flint residents. She works with the Democracy Defense League, the Michigan Poverty Roundtable and Stand Up for Democracy. Along with Mays and other activists, she petitioned the EPA in October 2015 to ensure safe water for Flint residents.

The event is co-sponsored by the Center for Gender in Global Context, Gender Justice and Environmental Change, Department of Community Sustainability, Lyman Briggs College, Environmental Science and Policy Program and Project 60/50 at MSU.

For more information on the panel discussion, contact the GenCen office at (517) 353-5040 or email gencen@msu.edu.

http://michiganradio.org/post/flints-public-works-director-resigns

By Steve Carmody • 14 hours ago

ShareTwitter Facebook Google+ Email

Flint's public works director has resigned.

Howard Croft played a highly visible role in the city's drinking water crisis.

Appointed by Flint's emergency manager in 2011, Croft oversaw the city's switch from Detroit water to the Flint River, and back again after serious problems developed from the river water.

During the 18 months the city of Flint drew its drinking water from its namesake river, Howard Croft often received the brunt of the public's anger. Croft was the point man for explaining why the city's drinking water was safe or was improving.

As the city's drinking water crisis deepened, Croft stressed the importance of addressing the problem in people's homes.

"We need to get out there and test," Croft said. "We need to get out there and find out where there is a concern."

Croft becomes the latest city official whose tenure was marked by the city's drinking water crisis to depart city hall.

Earlier this month, voters turned out incumbent Mayor Dayne Walling. Many voters cited Walling's role in the switch to the Flint River as their reason to voting for his opponent. Karen Weaver was sworn in a week ago as Flint's new mayor.

http://michiganradio.org/post/states-instructions-sampling-drinking-water-lead-not-best-practice

By Rebecca Williams • 2 hours ago

ShareTwitter Facebook Google+ Email

Listen to today's Environment Report.

The Flint water crisis has uncovered all kinds of details about how cities test the safety of their drinking water.

In particular, critics say the state is giving bad advice on testing drinking water for lead.

The state of Michigan tells cities to do something called pre-flushing.

The instructions tell people to turn on their cold water tap and let it run for five minutes (that's the pre-flushing part). Then, people are supposed to wait six hours before taking their water sample.

Critics say pre-flushing is one of many practices used to skirt the intent of the EPA's lead and copper rule.

Lee Anne Walters wants to see the rules changed. Her four-year-old son had elevated lead levels in his blood after Flint started using the Flint River as a water source.

"I want the loopholes for the lead and copper rule out. I'm not going to stop until that happens," she says.

She's speaking at a national meeting this week in Virginia about proposed revisions to the lead and copper rule.

The trouble with pre-flushing

Marc Edwards is a professor at Virginia Tech University and an expert on water treatment. He says a lot of cities around the country do this pre-flushing when they test drinking water for lead. But he argues they should not.

"It cleans the pipe of both soluble lead and also to the extent there's little lead particles in the wall of the pipe they'll be swept out of the pipe so they're not present when you sample the next day," he says.

"Who sits around and flushes their kitchen tap every night for five minutes before they go to bed? Nobody."

He says that means you can end up skewing your lead sample results lower, and make it appear that you have less lead in your drinking water than you actually do.

"Why add this complexity on and tell people to do something they don't normally do? Who sits around and flushes their kitchen tap every night for five minutes before they go to bed? Nobody."

Here's the thing about pre-flushing...

It's not banned under the federal lead and copper rule, but the EPA says cities should not do it.

Peter Grevatt directs the EPA's Office of Groundwater and Drinking Water.

"The idea of pre-flushing, typically that's something that would not be done. It's not prohibited under the rule, but at the same time we don't view it as best practice."

Grevatt says they to want work with states and water systems so they understand this.

This June, an EPA employee expressed concern in a internal memo obtained by the ACLU that this practice was being used to collect water samples in Flint.

In the memo, EPA Regulations Manager Miguel Del Toral wrote that pre-flushing has been shown to "result in the minimization of lead capture and significant underestimation of lead levels in the drinking water."

He continues:

"Although this practice is not specifically prohibited by the LCR, it negates the intent of the rule to collect compliance samples under 'worst-case' conditions, which is necessary for statistical validity given the small number of samples collected for lead and copper under the LCR. This is a serious concern as the compliance sampling results which are reported by the City of Flint to residents could provide a false sense of security to the residents of Flint regarding lead levels in the water and may result in residents not taking necessary precautions to protect their families from lead in the drinking water."

Del Toral wrote that he raised this concern with the Michigan Department of Environmental Quality, and "the MDEQ has indicated that this practice is not prohibited by the LCR and continues to retain the 'pre-flushing' recommendation in their lead compliance sampling guidance to public water systems in Michigan."

Virginia Tech professor Marc Edwards says he joined Del Toral in expressing concern to the MDEQ about the agency's testing guidelines.

“They were told point blank by Miguel Del Toral and myself earlier this year that the effect of the pre-flush was to hide the lead and it was recommended that they stop it. And they put in writing that they were not going to do that and they had no interest in doing that.”

Edwards is referring to documents Virginia Tech obtained from the MDEQ under the Freedom of Information Act. Notes from a July 21, 2015 conference call between the EPA and MDEQ say:

“MDEQ is not interested in changing its position on pre-flushing until new regulations come out. They also pointed out that the pre-flushing instructions are not requirements, but suggestions. The Michigan pre-flushing instructions were designed as a way to ensure that sampled faucets were not stagnant for an excessive period of time beyond the targeted 6 hour (i.e. rarely used faucets or when a homeowner has been gone for an extended period of time).”

That last statement about how long water can be stagnant in the pipes before sampling is also a point of contention.

An official EPA memo from 2004 says there's not a limit:

The LCR also defines a proper sample as a first draw sample, 1 liter in volume, that is taken after water has been standing in plumbing for at least six hours, and from an interior tap typically used for consumption - cold water kitchen or bathroom sink tap in residences. [40 CFR 141.86(b)(2)] There is no outer limit on standing time.

The DEQ did not provide anyone for an interview for this story.

In an email, DEQ spokesman Brad Wurfel said, "We're reviewing the testing protocol as part of our internal review. When we've got something to announce, I'll let you know."

It’s important to note, this goes beyond Flint.

A number of cities around Michigan follow the state's pre-flushing guidelines.

A number of cities around Michigan follow the state’s pre-flushing guidelines. Ann Arbor, East Lansing and Detroit all said they tell people to flush their tap water for five minutes.

But the City of Flint has recently changed the way it tells residents to sample water for lead.

Mike Glasgow is Flint’s Utilities Administrator. He says a few weeks ago, they removed the pre-flush recommendation from the instruction sheet they hand out to residents who want to test their water for lead.

“We removed the pre-flush after recommendations from experts in the field and a few of EPA’s researchers, so we’re going to err on the side of caution while we remove the flushing,” he says.

Glasgow says they’ve asked the MDEQ to let them keep their new "no-flush" method for the next round of official water testing for compliance with the lead and copper rule.

He says he’s waiting to hear how state officials respond.

Mark Brush and Lindsey Smith contributed reporting to this story.

---

http://www.bna.com/michigan-leaders-fire-b57982063610/

Michigan Gov. Rick Snyder (R) and several state officials are facing two lawsuits--and a barrage of criticism--stemming from their failure to take timely action when Flint residents complained that murky, foul-smelling water was coming out of their faucets after a switch away from the Detroit water system in April 2014.

The city, operating under a Snyder-appointed emergency manager at the time, made the switch to the Flint River as a water source as a way to save money. Yet the corrosive river water wasn't treated with anti-corrosive agents, and lead soon found its way into the city's water system.

Residents' complaints weren't addressed--in fact, state officials publicly stated that the water was safe -- until Virginia Polytechnic Institute researchers tested the water and found lead, and a pediatrician at a local hospital released a study showing elevated lead levels in the blood of city schoolchildren.

City residents have filed a class action lawsuit in federal court, and the Natural Resources Defense Council announced its intent to sue for violations of the Safe Drinking Water Act. Snyder has appointed a task force to look into the matter, and the Environmental Protection Agency is also investigating.

NRDC attorney Anjali Waikar gives the Flint community credit for bringing the issue to the forefront.

Tom- Below is a link to the web page that I would like you to review and work with Anne (and Allison) on tomorrow. I shared the language you provided earlier and as we looked at the web page we thought it may make more sense to eliminate the reference to flushing, except to say that normally we recommend flushing but given that ....Corrosion control treatment has been reintroduced with Flint's recent return to water from the Great Lakes Water Authority. The protective scales within the service lines are being built up and the stability of this growing scale is hard to know throughout the water system. EPA recommends that all residents (do we want to say particularly pregnant women, infants and children) use only bottled water or water that is filtered through a water filter that is certified to remove 'total lead' for drinking, cooking and making baby formula until further notice.

The concern is that there is a lot of language on flushing that may cause confusion. Please let me know what you think. I believe the goal is to stand the web page on Wed. Thanks

Advice to Flint Residents About Lead in Drinking Water

EPA recommends that all residents, especially pregnant women, infants, and children, use only cold water that is filtered through a water filter certified to remove 'total lead' or bottled water for drinking, cooking, and making baby formula until further notice. Normally, EPA recommends running your water when it has not been used for long periods of time. However, the protective scales within the service lines are still being built up with Flint's return to water from the Great Lakes Water Authority and the stability of this growing scale is hard to know throughout the water system.

EPA and the Centers for Disease Control and Prevention believe there is no safe level of lead exposure. Lead is harmful to health, especially for children. While paint, dust, and soil are the most common sources of lead, drinking water can contribute 20 to 40 percent of an infant's lead exposure.

Flint residents concerned about lead in their drinking water have a number of options to help reduce the amount of lead in their drinking water.

- Have your water tested. Flint residents can have their water tested for free by calling the City of Flint Water Plant at (810) 787-6537, then pressing 1. Flint residents may also email flintwater@cityofflint.com.
- Be aware of any work that could disturb your lead service line, such as water main replacement, lead service line repair or replacement of part of the service line.
- On a regular basis clean and remove any debris from faucet aerators to clear out any particles of lead that may become trapped in the aerator.
- Purchase lead-free faucets and plumbing components.
- Remove the entire lead service line.

How do I know if I have a lead service line?

What do lead service lines look like?

Cleaning aerators

Collecting water samples

Subject: Just confirming your revisions

Susan, please double-check the current version of **Flint Corrosion Control Treatment – Key Dates** to ensure I've made the revisions as directed. If not, please let me know and I'll correct it. I haven't heard back from Liz yet.

On July 21, 2015, the EPA Region 5 Water Division Director convened a conference call with MDEQ. During the call MDEQ reported on the second 6-month round of Flint tap water sampling, which was conducted from 1/1/2015 – 6/30/2015. The 90th percentile lead level for the second round of sampling was 11 ppb. In light of these results, MDEQ agreed to require Flint to implement corrosion control as soon as possible. EPA Region 5 again offered to provide EPA corrosion control experts to assist MDEQ.

On November 3, 2015, the EPA Office of Ground Water and Drinking Water issued an interpretive memo which clarifies the Lead and Copper Rule and sets forth steps that the rule requires large public water systems (such as the City of Flint) and primacy agencies (such as MDEQ) to take in the future "to ensure that appropriate corrosion control treatment is maintained at all times."

Subject: RE: QUESTION : PEHSU/ Amer Acad Pediatrics Requesting Guidance for early childhood/Head Start centers and their families re: Lead in Flint, MI
image003.jpg

All - my recommendation on this would be the same as what we are providing on our website for flint...pregnant women, infants and children should not drink the water unless it is filtered using a water filter that is certified to remove 'total lead' [option 1: further notice] or [option 2: an assessment can be conducted on the effectiveness of flushing under the current conditions].

Maryann - below is the rationale for why this is different from what we would typically recommend...

In most systems with stable water qualities and stable treatment, such as here in Chicago, flushing for 3 to 5 minutes can be an effective way to reduce lead levels. However, where the water quality and treatment have changed significantly, as is the case with the City of Flint, flushing advice may not be appropriate as particles containing high concentrations of lead can be released sporadically more easily at any time into the water due to the instability of these lead-bearing scales.

Even though corrosion control treatment has been reintroduced via Detroit, because of the absence of corrosion control over an extended period of time and the iterative water quality changes that have occurred, the stability of the scales within the service lines is currently unknown. In addition, we just received information that recent sampling at some homes conducted by the City of Flint, even with pre-flushing, has exceeded 100 ppb for lead. Lead levels this high are typically associated with the release of lead particles, consistent with the findings of previous sampling conducted in Flint.

My advice is that we should not be recommending flushing to the residents of Flint at this time due to the potential instability of the scales within the service lines and the potential for the release of particles that contain high lead. It should be recommended that pregnant women, infants and children use only bottled water or water that is filtered through a water filter that is certified to remove ‘total lead’ for drinking, cooking and making baby formula until [option 1: further notice][option 2: an assessment can be conducted on the effectiveness of flushing under the current conditions]

Subject: QUESTION : PEHSU/ Amer Acad Pediatrics Requesting Guidance for early childhood/Head Start centers and their families re: Lead in Flint, MI

Tom,

I received the message below from the American Academy of Pediatrics (AAP), which serves as one of the 2 Coordinating Organizations for the network of Pediatric Environmental Health Specialty Units (PEHSU) that EPA and ATSDR co-fund.

AAP received an inquiry from Head Start in Flint, MI, related to lead in the DW. It sounds as if the Head Start organization would like informational materials or other resources they can share with their centers and families.

I'm aware of EPAs 3T's material, Testing Schools and Child Care Centers for Lead in the Drinking Water, but I'm not sure they're appropriate in this situation. I'm also familiar with EPA's general informational website for lead in DW, http://water.epa.gov/drink/info/lead/leadfactsheet.cfm

As there is an on-going concern in the area, I thought you'd be in the best position to identify existing resources and informational materials, perhaps that the City of Flint or others have developed.

As a reminder, Head Start is a federally funded child development program designed to help break the cycle of poverty by providing children, from Birth through Age 5, of low-income families with comprehensive programs to meet their educational and health needs.

I can respond to the request from AAP once I've gathered all the available resources, and would certainly share my response with you before I send it out.

Thanks, in advance, for your kind assistance in this matter!
Maryann

Subject: Lead in Flint, MI

Hi Maryann,

I received your information from Susan Buchanan at UIC/Region 5 PEHSU.

The American Academy of Pediatrics is one of the national offices for the PEHSU program, and we've received an inquiry from the Head Start center on health regarding information on the lead in water in Flint, MI. I believe they would like to share resources with their centers and families.

The PEHSU program has a couple of fact sheets on lead for both health professionals and families, but I was wondering if you have any guidance for early childhood/Head Start centers and their families.

If this has already been addressed at the regional level, I can let them know as well.

Any help is greatly appreciated.

Best regards,

Hey can we have the final documents for these activities:

- **October 30, 2015** – Task Force provides MDEQ with technical comments on Flint Corrosion Control Permit and cover letter.
- **October 23-24, 2015** – Task Force provides MDEQ with technical comments on Flint Corrosion Control Plan.

I'm going to suggest we post them on the document section of the new website. (We'll ask Bob and Susan.)

Thanks for the response. Susan has asked some of us to test pieces of the website before advertising it's live.

Thanks,

Eileen

By Virginia Gordan • 16 hours ago

Flint leaders want the U.S. Environmental Protection Agency to strengthen its regulation of public drinking water systems.

U.S. Congressman Dan Kildee, D-Flint, and seven others testified today in front of the EPA's National Drinking Water Advisory Council. The Council is developing recommendations to the EPA about changes to its rule on lead and copper in water.

Kildee said the agency needs to tighten up its regulations to make sure what happened in Flint never happens again.

"The current rule, for example, did not require rigorous testing and modeling before switching to a new water source," said Kildee. "Something that back home seems unfathomable, to go from a source that is derived from the greatest freshwater source on the planet, surface freshwater source, the Great Lakes, to the Flint River, which, if you live in my hometown at the time seemed almost like a punchline to a joke."

High lead levels were found in Flint's drinking water supply when the city switched to the Flint River for its water.

"The current rule also failed to require the city of Flint, which was under the management of the state government at the time, to add corrosion-control treatment," Kildee said.

Kildee said changes to the rule should also promote accountability and transparency to restore public trust and ensure drinking water is safe.

By Ron Fonger on November 18, 2015 at 2:46 PM

FLINT, MI -- Elected officials and activists have delivered the story of Flint's lead in water crisis in person to the federal government, testifying Wednesday, Nov. 18, before a U.S. EPA advisory council.

"What happened in Flint is a failure of government, and we must ensure that it never happens again to Flint or any other community," U.S. Rep. Dan Kildee, D-Flint, said in opening testimony to the National Drinking Water Advisory Council. "The EPA has the ultimate responsibility to ensure that drinking water standards are followed."

In addition to Kildee, state Senate Minority Leader Jim Ananich, D-Flint; Dr. Mona Hanna-

Attisha of Hurley Medical Center; Flint resident LeeAnne Walters; and professor Marc Edwards of Virginia Tech university all testified to the council, which is considering changes in federal rules on lead in water.

Walters, whose home water registered lead levels of 104, 397 and 707 parts per billion in separate city tests, showed much higher lead levels in testing by Virginia Tech, registering from 2,500 to 13,000 parts per billion of lead.

The federal threshold for lead in water is 15 parts per billion. Walters told the advisory council that water sampling methods allowed by EPA contributed to an underestimation of the lead-in-water problem in Flint.

Sampling of water by the city and testing by the state showed the levels of lead in Flint's water were rising, but within federal guidelines for lead after the city began using the Flint River as its source of drinking water in April 2014.

But Virginia Tech researchers found much higher lead levels in their testing, and Hanna-Attisha found that the blood lead levels of infants and children here had doubled citywide since the city began using the river. The state did not require that it be treated to make it less corrosive to lead transmission pipes and plumbing.

Walters urged the advisory council to change federal rules to make states eliminate the practice of pre-flushing pipes in advance of collecting water samples and to require the use of wider-mouthed sample bottles to allow for more accurate readings of lead and copper in water.

"We were constantly being told our water was safe by the city and by the (Michigan Department of Environmental Quality), and it wasn't," Walters said. "My child and the children in Flint were not just lead-poisoned by the water. They were lead-poisoned because the EPA let the water systems lie and lots of other cities are lying now."

The advisory council advises the EPA administrator on issues concerning drinking water protection and public drinking water systems. It has been considering changes in the federal lead and copper rules.

Ananich told the group that Flint residents learned first-hand that there are problems with the current procedures for lead testing and said that realization has produced a mistrust in government.

"The fear and anger and mistrust that my community feels because of this crisis is real and is justified," Ananich said. "The system failed us -- the very people it was designed to protect.

http://www.freep.com/story/news/local/michigan/2015/11/18/flint-lead-problems-raised-national-water-hearing/75990848/

Todd Spangler, Detroit Free Press 5:15 p.m. EST November 18, 2015

WASHINGTON — U.S. Rep. Dan Kildee was among a group from Michigan testifying Wednesday before an advisory panel looking at changes to the nation's regulations on lead in drinking water, saying the current rule — as applied by state and federal agencies — failed the people of Flint after high levels of lead were detected this year.

"What happened in Flint is a failure of government," Kildee, D-Flint Township, told the National Drinking Water Advisory Council on Wednesday. "People expected that the government at multiple levels would be able to protect them ... and the government failed them."

Kildee's remarks came after months of controversy regarding Flint's water after it stopped using Detroit's water system and switched to water from the Flint River without adding corrosion controls, which may have led to higher levels of lead and has been blamed by some for health problems. He joined a group that included state Sen. Jim Ananich, D-Flint, who testified before the advisory council Wednesday about Flint's recent water problems.

In recent weeks, Flint has switched back to using Detroit water and the Michigan Department of Environmental Quality has acknowledged it should have used a different protocol in requiring corrosion control for Flint. The Environmental Protection Agency is auditing the state's drinking water program.

Kildee said, however, that as the EPA looks at rewriting its national rule for lead and copper in drinking water, it needs to fix regulations that initially failed to require Flint to add corrosion control when it switched to using Flint River water and testing methodologies for lead that could allow high lead levels to go undetected.

"The current rule, for example, did not require rigorous testing and modeling before switching to a new water source," said Kildee, who added that it seemed "almost like a punchline to a joke" to many Flint residents that they'd go from freshwater from the Great Lakes to Flint River water.

"The notion that that wouldn't trigger a much more robust analysis of what that water consisted of, and what that would mean in terms of treatment required, is almost beyond reason," Kildee told the advisory council, which is writing recommendations for the EPA for changes on the lead and copper rule.

A subgroup also advising the advisory council is presenting proposals for changing the lead and copper rule, noting that even when corrosion controls are used in city water systems, lead-bearing plumbing materials in homes can allow the metal to seep into water. The EPA does not recognize a “safe” level for lead.

In his testimony, Ananich said the EPA needs to act on the vital role in plays in ensuring that regulations are in place to protect the public health.

“Instead of a shield to protect families from exposure, in our case it appears the lead and copper rule was used as a shield to protect officials from having to admit there was a dangerous and foreseeable problem," Ananich said in a statement after the hearing. "The standard should never be: ‘What is the least we can do to fulfill our obligation.’ "

Others testifying Wednesday before the advisory council on Flint included LeeAnne Walters, a Flint resident who raised concerns about lead in the city water; Marc Edwards, a Virginia Tech professor who brought a team to Michigan to study the water supply; and Dr. Mona Hanna-Attisha, a local pediatrician who found that the blood-lead levels in children in Flint had jumped dramatically this year.

In her testimony, Hanna-Attisha told the advisory council she just recently examined a 1-year-old who showed elevated levels of lead in her blood.

"When pediatricians hear of any lead in a child we absolutely freak out," she said, noting the developmental problems that appear to be associated with high lead levels.

According to the EPA's website, infants and children who drink water containing excess lead could face delays in their physical or mental development and potentially experience deficits in attention span and learning abilities. Adults who drink water with high levels of lead may also develop kidney problems or high blood pressure.

WASHINGTON, Nov. 18 -- Rep. Daniel Kildee, D-Mich. (5th CD), issued the following news release:
Congressman Dan Kildee (MI-05) today testified before a meeting of the Environmental Protection Agency's (EPA) National Drinking Water Advisory Council (NDWAC) about the Flint

water crisis and changes to federal policy that can be made to promote transparency and accountability for city residents. A full transcript of his remarks, as delivered is below:

"I just want to bring to your attention the story of my hometown, Flint, Michigan. I'm sure many of you have been following the case of Flint. Water and the health of my community and the quality of water is the single most important issue right now back home. It's the one we hear about more than anything else.

"What happened in Flint is a failure of government. People expected that the government at multiple levels would be able to protect them by making sure that the water that they drink is healthy for them, and the government failed them. And I'm here to specifically address that.

"If it were not for some unsung heroes, some individuals back home that insisted and continued to press the case that the water in Flint was unsafe, it may have never have come to light. So people like Leanne Walters, who we will hear from, Dr. Marc Edwards, who provided the data that warned of this, data which was dismissed by many at multiple levels of government, and Dr. Mona Hanna-Attisha, all of whom are here, who found elevated lead levels in Flint's children.

"Again, initially that data, that really important data, was essentially dismissed by individuals who were responsible to make sure that the water in my hometown, the water which was flowing through the plumbing of people in Flint, Michigan, was safe. Thanks to them we were able to uncover this incredible health crisis, and that's what I'm here to address. I also want to acknowledge - and you'll hear from him again soon - Senator Jim Ananich, whom I've known for a long time and who has been an important part of the effort back home.

"So after months, the state of Michigan finally admitted that federal drinking water laws, including the Lead and Copper Rule, were not followed. Ultimately the EPA has responsibility to ensure that clean drinking water standards are followed.

"This new Lead and Copper Rule must have greater transparency in order to restore public confidence and protect public health and ensure the safety of drinking water. Residents deserve to know why for months the state of Michigan failed to follow federal safe drinking water laws. At my request, the EPA is conducting a complete audit of Michigan's implementation of the Lead and Copper Rule, so I hope some of the lessons learned during that audit can be included in the latest revisions of this Lead and Copper Rule.

"As I mentioned, Dr. Edwards and Dr. Mona Hanna-Attisha and other experts are testifying today and can go into more detail on the details of the necessary changes to the rule. But I want to highlight what I see as a couple of gross failures.

"The current rule, for example, did not require rigorous testing and modeling before switching to a new water source. Something that back home seems unfathomable, to go from a source that is derived from the greatest freshwater source on the planet, surface freshwater source, the Great Lakes, to the Flint River, which, if you live in my hometown at the time seemed almost like the punchline to a joke. The notion that that wouldn't trigger a much more robust analysis of what that water consisted of, and what that would mean in terms of treatment required, is almost beyond reason.

"The current rule also failed to require the city of Flint, which was under the management of the state government at the time, to add corrosion control treatment. And the testing methodologies allowed for, until very recently, the Michigan Department of Environmental Quality, as their protocol suggested, treat flushed water before supplying test samples, which obviously could obfuscate - and did in this case - the presence of lead going into those homes. So the experts can focus more on that.

"My interest is really making sure that this body understands that the state and federal officials neglected their obligations to notify the public of this health risk.

"I appreciate the efforts of this organization. The experience of the city of Flint is a real life experience and points to the importance of this rule having all the protections that you intend to put in it, and I sincerely hope that that will be the case. So thank you for giving me just a couple of minutes."

---

Updated: Wed 6:06 PM, Nov 18, 2015 By: Kellie Meyer

WASHINGTON, D.C. (WJRT) - (11/18/15) - The doctor who helped expose Flint's problem with lead in the drinking water spent Wednesday morning talking about the issue before leaders in Washington D.C.

Dr. Mona Hanna-Attisha testified before the Environmental Protection Agency, along with a Flint mother who claims her child has lead poisoning.

Hanna-Attisha used a PowerPoint presentation to showcase how something like this can happen anywhere across the country, not only in Flint.

The U.S. Environmental Protection Agency is conducting an audit on the state of Michigan's drinking water safety.

This audit comes after the Michigan Department of Environmental Quality admitted to using the wrong protocols after it approved Flint's switch to the Flint River as a primary source of drinking water.

Representative Dan Kildee of Flint also took part in the hearings and has been an advocate for congressional change since the issue surfaced.

Subject: Inside EPA Article on this week's National Drinking Water Advisory Council Meeting -- Lead and Copper Rule Revisions

EPA Advisors Reject Push To Modify Lead Rule Recommendations

Posted: November 19, 2015

EPA's National Drinking Water Advisory Council (NDWAC) is unanimously backing a work group's recommendations on how the agency should revise its lead and copper drinking water rule despite concerns from environmental, public health and municipal advocates who say the recommendations fail to adequately protect water customers from the effects of lead poisoning.

NDWAC, at its Nov. 17-19 meeting in Washington, D.C., finalized the Lead and Copper Rule (LCR) Working Group's recommendations made during a series of meetings over the past year, adding a cover letter with "enhancements" that emphasize the need to prioritize actions to limit lead exposures in populations especially vulnerable to lead poisoning. These include pregnant women, infants, children and low-income, environmental justice populations.

But the final recommendations, which will be sent to EPA Administrator Gina McCarthy, fall short of the concrete policy changes environmentalists, public health advocates and municipal officials called for during public comments at the meeting.

EPA Office of Ground Water and Drinking Water Chief Peter Grevatt urged the advisors at the meeting to consider the commenters' recommendations, particularly their strong focus on low-income populations, adding that EPA would have to strongly consider them once the proposal reached headquarters. "I just want to make sure the council fully appreciates how these are going to play out for EPA in the long-term revisions to this rule," he said.

NDWAC's recommendations strongly encourage drinking water utilities to conduct full lead service line replacements (LSLRs), rather than partial replacements, by setting goals, working with customers to speed up replacement and receiving credit for replacement of lead-containing connecting pipes and/or confirmation that a service line initially inventoried as an LSL is not lead. But the recommendations do not call for prohibiting partial replacements.

Current Safe Drinking Water Act (SDWA) regulations require lead service lines to be replaced if lead levels in drinking water exceed an action level, and permit partial LSLRs, but EPA's Science Advisory Board has concluded that partial LSLRs do not reliably reduce lead levels in drinking water.

NDWAC's letter to McCarthy also notes the cost burden of the group's recommendations, without making specific cost estimates or requests for funding -- a key obstacle in incentivizing full LSLRs where customers likely would have to pay for LSL replacement on their property.

"The removal of all lead service lines would require significant financial resources and time," the letter notes. "During this time it is essential to have in place a robust effort of consumer education and engagement to assure ongoing protection from exposure to lead in drinking water."

Advocates, however, say this language is not strong enough or urgent enough to mitigate health crises like that in Flint, MI, where lead levels spiked after the city switched its water supply source from Detroit's municipal system to the Flint River. Environmentalists are threatening to sue state and local officials over their handling of the switch. And EPA has sent a task force to Flint to prevent future problems.

Other Recommendations

In addition, the final recommendations advise EPA to strengthen corrosion control treatment (CCT); modify monitoring requirements to provide for customer-requested tap samples and to assess the effectiveness of CCT; establish a health-based, household action level that triggers a report to the consumer and to the applicable health agency for follow up and separate the requirements for copper from those for lead, with new requirements targeting water that is corrosive to copper.

The full NDWAC also emphasized the working group's recommendation that EPA establish an "easily accessible, national clearinghouse of information about lead in drinking water to serve the needs of the public and of public water systems" in order to help, in particular, small and medium size systems in communicating more effectively with their customers on the risks of lead in drinking water, rather than just in paint.

Among the most vocal critics of the recommendations is LCR work group member Yanna Lambrinidou, president of Parents for Nontoxic Alternatives.

In an Oct. 28 letter to NDWAC, Lambrinidou dissents from the work group's recommendations, in part for its lack of a strict ban on partial LSLRs and its approach to giving compliance credit for a phasing-in full LSLRs with three year reporting goals for progress, even though partial LSLRs do not count toward a credit.

"The specifics of the [working group's] recommendation allow [public water systems] to delay full LSL replacement for decades, if not indefinitely, as well as to continue conducting partial LSL replacements, despite an extensive body of scientific research demonstrating that, under at least some circumstances, these replacements can pose a significant short- and long-term public health risk to consumers," Lambrinidou writes.

And during public comment Nov. 18 at the NDWAC meeting, Lambrinidou emphasized that although cost is a major impediment to more stringent full LSLRs requirements, most residents, when educated, understand the urgency and desire a full replacement.

"I hope folks can appreciate a serious loophole that when homeowners refuse, then a partial LSL might be acceptable," she said. "There are very legitimate reasons why homeowners refuse, and if we don't pay very close attention, and we create general permission for partials to be conducted when homeowners refuse. I think we're entering very, very dangerous territory." She added that interviews she conducted with homeowners said they would have opted for a full LSLR had they known the risks, but that cost remained the biggest impediment.

Regulatory 'Loopholes'

Other commenters at the meeting also spoke of “loopholes” in the current rule they feared would be carried over to the new rule.

Officials from Flint said their lead crisis happened due to a failure of the Michigan Department of Environmental Quality to require new testing when the town switched water sources and failed to require Flint to add corrosion control treatment, required in the current LCR.

U.S. Rep. Dan Kildee (D-MI), who represents Flint, told the panel Nov. 18 that its proposed revisions “only assured we would have met the intent of this rule 25 years later, and then if we prevented these deficiencies, we would finally achieve that intent.”

While Michigan advocates complained that neither the current nor proposed new rule required rigorous testing and monitoring before switching to a water source, others said tap sampling contained “loopholes” in that it did not encourage the use of “worst possible scenarios.”

But NDWAC members, in later deliberations, said this was based not on the plain language of the 2007 LCR, but on lack of compliance. To remedy this, they included language in their “enhancement” letter to McCarthy directed at utilities, saying “prior to the adoption of the new rule, compliance with the existing rule is essential.”

Service Line Control

NDWAC, like the smaller working group before it, also declined to revisit a longstanding request by public health and environmental advocates to revisit how a utility should be required to define when it “controls” part of a lead line. A change could allow EPA to mandate full LSLRs, and utilities and municipalities would be responsible for that replacement.

Currently, when a system exceeds the lead action level, EPA requires it to replace only the portion of the LSL that it owns, but advocates believe the definition of “ownership” should be replaced with a requirement that public water systems must replace the entire LSL where they have the authority to “replace, repair or maintain” the line.

Jennifer Chavez, a staff attorney with Earthjustice, said during public comments that the current approach to lead line ownership “has been a failure.”

“We were disappointed that the work group did not even recommend options for addressing the primary obstacle: a shared responsibility regime which makes water consumers responsible for protecting consumers from lead services lines, in the particular ownership-based requirement,” Chavez said. “It led to so many partial LSLs, which occur because so many people in America cannot afford to come up with the $3,000 to $7,000 [for the full LSL].”

“It’s impossible to deny that what is needed in the U.S. to protect children from LSLs is going to be expensive and challenging but when we focus on the cost to utilities, we miss the point, because the question is, are we going to put those costs for private consumers on the backs of an already overburdened population, or come up with funding mechanisms that enable everyone in the U.S. to contribute to solving this public health problem?”

But one NDWAC member, Carrie Lewis, superintendent of Milwaukee Water, said the entire capital budget for water projects for her city is nearly half of what it would cost to do the full LSLs already strongly encouraged in the revisions.

“I would ask this group that when looking at these criteria, to find other ways utilities can demonstrate an adequate pace, an adequate effort, an adequate improvement, other than a straight percentage [of lines that must be replaced] year after year,” Lewis said. She also requested that the group reiterate its support of the 2007 LCR’s original definition of “ownership” in its enhancement letter to McCarthy. -- *Amanda Palleschi*

End water shutoffs in Flint during public health emergency (flint journal editorial)

Government Exposed Flint Residents to Dangerous Lead Levels in Drinking Water (legal reader BLOG)

---

http://www.mlive.com/opinion/flint/index.ssf/2015/11/editorial_end_water_shutoffs.html

By MLive/Flint Journal opinion The Flint Journal on November 20, 2015 at 9:00 AM, updated November 20, 2015 at 9:08 AM

The following is an opinion of The Flint Journal Editorial Board.

FLINT, MI -- Faced with mounting delinquent water bills, the city of Flint recently announced it would resume sending water shutoff notices to overdue customers.

These shutoffs are unacceptable in the face of the city's water quality crisis.

The residents of Flint – some of the poorest in the country – have already been subjected to tainted water due to a failure of government oversight. Now, the city of Flint is adding insult to injury by threatening to cut off all access to water in some households, putting money above public health.

Local and state leaders should instead focus on correcting the fundamental problem: old lead service lines running under the city's surface.

Rather than spend its time punishing people for failing to pay for bad water, the city would be better served working to properly identify which homes are at high risk for lead poisoning — something the federal government demanded more than two decades ago but the city failed to do.

We need to see more urgency from the governor's office, Department of Environmental Quality and the U.S. Environmental Protection Agency on a long-term strategy for solving this crisis.

An aggressive plan for scouting out and replacing the lead service lines is a more appropriate use of government resources amid the current public health emergency. As the crisis occurred while the city was under the oversight of a state-appointed emergency manager, the state should provide funding to get it started.

Even though water shutoffs are a routine practice that have a proper time and place in municipal governance, Flint's situation is anything but routine.

Double-digit rate hikes in 2011 – which the city attributed to aging infrastructure and population loss, among other causes – pushed residents monthly bills to over $100 or more. A legal challenge to the increase is sitting before Genesee Circuit Judge Archie Hayman.

And, after the city switched to using the Flint River as its water source in 2014, Flint's drinking water has been plagued at different times by bacteria, chemical contaminants and most recently, high levels of lead.

Until the city and state can show that the amounts of lead in Flint's water are far below the actionable level, no one in the city should have their water shut off for nonpayment. The state, who is ultimately responsible for this mess, should step in and subsidize the cost of treatment, if needed.

Even if families are not drinking the water – a justifiable move considering current events – shutting off all water to a household could jeopardize residents' health and prevent them from accessing water for bathing, washing and other needs.

Shutting off water to the city's poorest and most vulnerable residents is an extreme measure that must be avoided. It's yet another offense to a population that's too long been served with water they can't trust.

---

http://www.legalreader.com/government-exposed-flint-residents-to-dangerous-lead-levels-in-drinking-water/

Opinion Blog by Jay W. Belle Isle - Nov 19, 2015

If you can't trust your governor… I can't finish that sentence. Flint, Michigan residents have every reason to distrust their governor. They've recently filed suit against the city and the state alleging that both entities put their health in danger. The claim states that the government exposed Flint residents to dangerous lead levels in drinking water.

To say that the city of Flint has had some hard times economically is akin to saying that winter is cold. In 2014, Michigan governor Rick Snyder put the city under emergency financial management. As a cost-cutting effort, he also had the city switch its water supply from Detroit's water system to the Flint River in April 2014.

Despite assurances that water from the Flint River was safe to drink, residents began experiencing health problems such as skin lesions and respiratory disorders. The city of approximately 99,000 was switched back to Detroit's water system last month.

Residents of Flint, Mich. (shown here in January), have been protesting the quality and cost of the city's tap water for more than a year.

The suit claims that the damage has been done. Flint is an old city and many of its water pipes are made of lead. The claim is that the pipes and service lines were corroded by water from the Flint River, thus allowing lead into the water supply.

Residents are seeking class-action status for the suit, as well as compensatory & punitive damages, appointment of a monitor to oversee Flint's water supply and the creation of a medical monitoring fund.

Just this week, the ACLU of Michigan and a nonprofit, the Natural Resources Defense Council stated that they would file suit too, if the damage isn't repaired. Named defendants in the suit include Gov. Snyder and former Flint Mayor Dayne Walling. The new mayor, Karen Weaver, who beat Walling in this month's election, is not a named defendant. She is, however, listed as a possible defendant in the ACLU's case.

Flint is located roughly 68 miles (109 km) northwest of Detroit.

This is a federal case titled *Mays et al v. Snyder et al,* U.S. District Court, Eastern District of Michigan, No. 15-14002.

EPA Task Force Recommendations updated Final Draft November 19 2015 tpedits.docx

Attached is the revised Optimization and Maintenance of Optimal Corrosion Control Treatment – Preliminary Assessment.

My revisions:

1) Replaces "study/studies" with more acceptable words.

2) Takes out Section 4 0 – Funding Needs

3) Takes Miguel's internal notes for the Task Force and turns them into Comments (makes it easier to finalize the document by accepting changes and deleting all comments)

4) Adds what the information that is being requested will be used for.

Please take a look to see if there is anything in this version that should not be distributed to MDEQ and Flint (in draft) for their information.

Thanks.

US. EPA Region 5 – as prepared by john peterson *(ORA/OEC/PA)* on nov. 23, 2015.

Records: Mich. gov. office in loop on Flint drinking-water decision (USA TODAY network/detroit free press)

---

http://www.usatoday.com/story/news/nation-now/2015/11/22/records-mich-gov-office-loop-flint-drinking-water-decision/76222312/

Paul Egan, Detroit Free Press

LANSING, Mich. — Flint's fateful decision to sever its ties with Detroit as its supplier of drinking water went all the way up to the Michigan governor's office, state records obtained under Michigan's Freedom of Information Act show.

But whose fingerprints are on a subsequent and more damaging move — to get Flint's drinking water from the highly corrosive Flint River — remains much less clear.

On March 25, 2013, then-state Treasurer Andy Dillon and Gov. Rick Snyder's chief of staff, Dennis Muchmore, held a telephone conversation about “Flint water supply alternatives,” according to records obtained by the Free Press under FOIA.

Later that evening, the Flint City Council, which was under a state-appointed emergency manager, voted 7-1 in favor of a switch in the source of its water supply from the Detroit to a new Karegnondi Water Authority, a move that would ultimately lead to Flint using corrosive water from the Flint River as an interim source, which produced drinking water with unsafe levels of lead.

Dillon, who resigned as treasurer in October 2013, also held a Lansing meeting regarding Flint water at 9 a.m. the morning after the Monday Flint council meeting, and had a 1 p.m. phone call that Tuesday with Department of Environmental Quality Director Dan Wyant regarding “Flint/KWA,” the records show. Dillon also met in Lansing the day after the council meeting with then-Flint Mayor Dayne Walling,

The records, from Dillon's daily appointment schedule, show active state involvement immediately before and after the decision to make the Flint water switch, up to and including the offices of the treasurer, who oversees emergency managers, and the governor.

But the records don't show that Snyder or Dillon decided Flint residents should drink Flint River water until their new KWA pipeline to Lake Huron was completed. There's still murkiness over exactly how that decision came about.

The decision to draw water from the Flint River starting in April 2014, combined with a failure by the state Department of Environmental Quality to require treatment to soften the water to reduce corrosion and the leaching of lead from delivery pipes and other failures related to water testing, ultimately proved disastrous.

Residents complained about the taste, smell and appearance.

Lead, which can cause permanent brain damage in children, leached into the drinking water. Tests showed lead content well in excess of acceptable levels of 15 parts per billion. Other tests showed the number of Flint children with elevated blood-lead levels — 5 micrograms per deciliter or more — jumped from 2.1% in the 20 months prior to Sept. 15, 2013, to 4% between Jan. 1 and Sept. 15 this year. Certain ZIP codes showed even higher jumps in the elevated levels, from 2.5% of the children tested to 6.3%.

Just one hour north of Detroit in Flint, Michigan where residents have felt under siege for years, the newest threat pours from kitchen spigots and showerheads. VPC

After a public outcry, Snyder and the Legislature approved partial funding for Flint to reconnect to DWSD while it awaits the completion of the KWA. That reconnection to Detroit-supplied water happened Oct. 16.

Mayor Walling was quoted in March 2013 saying Flint would continue to get its water from the DWSD until the $272-million KWA pipeline system to Flint was completed. On Friday, he repeated his assertion that the plan was to stick with Detroit as an interim source, and said he was not aware of any pressure from Dillon or other state officials to instead use the Flint River as an interim source because it would be cheaper.

That decision came later, for reasons that are not entirely clear. Flint and Detroit, under the control of state-appointed emergency managers since late 2011 and March 2013, respectively, could not agree on a rate structure for the DWSD to continue serving Flint until the KWA pipeline was completed.

The failure to reach a pricing agreement on an interim water supply for Flint is puzzling considering Dillon's Treasury Department had commissioned an engineering study, which in February 2013 said it would be less costly for Flint to stay with the DWSD than to switch to the KWA. Also, state officials were consumed at the time with trying to keep Detroit out of bankruptcy, and for Flint to split with the DWSD could only make Detroit's financial situation that much more perilous.

Dillon said in an email to the *Free Press* Friday that although Detroit may have been under the state's control, the DWSD was not.

"After we signed off on Flint joining the KWA, Flint was to negotiate with the DWSD regarding using their water during the construction of the KWA," Dillon said.

"DWSD at the time was overseen by a board appointed by (U.S. District) Judge (Sean) Cox as the system was under federal oversight," Dillon said. "If Flint was unable to negotiate a fair deal, I recall their backup plan was to use the Flint River. I don't recall Treasury being involved in the negotiations with DWSD or, after negotiations broke down, in Flint's decision to switch to the Flint River."

March 2013 was one month after Dillon received a report he commissioned from the Detroit engineering firm Tucker, Young, Jackson Tull Inc., intended to "provide an analysis of the water supply options to assist the treasurer in determining any potential risk and the best course going forward for supplying potable water to the City of Flint."

The study found it would be less costly for Flint to stay with the Detroit Water and Sewerage Department than to cover its 30% share of the new KWA pipeline from Lake Huron.

"Treasury held two and possibly three lengthy meetings to go over the Tucker Young report with the Flint leaders, KWA consultants and DEQ representatives," Dillon said. "During these meetings, we learned several assumptions made by TY were incorrect and undermined the conclusions reached in their report."

"I never received any pressure from the governor's office to decide one way or the other on approving the KWA," the former treasurer said. "We ... made a decision based upon what we thought was in the best interests of Flint. The decision to support KWA was influenced by our conclusion that there was no financial risk to Flint for the project, and the DEQ's conclusion that it was more beneficial and economical for Flint to join KWA (again a separate and distinct decision from using the Flint River)." Also, "this is the outcome the local officials wanted," he said.

Walling said the decision to use the Flint River as an interim source was ultimately made by then-Flint emergency manager Edward Kurtz in about June 2013 when he expanded an existing engineering contract for the Flint Water Treatment Plant to cover needed upgrades.

Kurtz, contacted by telephone, declined to comment.

Snyder spokeswoman Sara Wurfel said the governor was part of "a consensus" about Flint splitting with the DWSD to get its long-term water from the KWA, but Snyder was not involved in efforts to reach an interim pricing agreement between Flint and Detroit, and not involved in the decision to draw drinking water from the Flint River.

Once talks between Flint and Detroit failed, "if you don't have another water source, where else was it going to come from?" she asked Friday.

Subject: RE: Revised Draft Preliminary Assessment

A couple of thoughts.

Recommend we do not eliminate the section header for 4.0 – Funding needs; rather, replace "summarized" with "to be determined" in parenthetic following, and strike the content of the section. Need a placeholder.

Also recommend we do not strike the 3 "internal notes" currently in the document. I think that the first identifies an issue we should keep in front of everyone and the next two have generally useful information for all to know. If they are turned into comments they will be lost when we finalize the document.

Engineer gets $907,000 contract add-on to prepare Flint for KWA water

Flint Journal file photo

FLINT, MI -- The engineering company that's been working with the city at its water plant will continue to as Flint prepares to treat raw water from a new Karegnondi Water Authority pipeline.

The City Council approved a change in the contract with Lockwood, Andrews & Newnam that will pay the company $907,650 to continue its work.

The change in the 2013 contract means the company will collect a total of up to $3.8 million for its work on Flint water issues, an arrangement that started when the city agreed to pay LAN $1.3 million to study the feasibility and develop cost estimates for using its water plant as a primary water source.

The work proposed in the change order covers specific items including jar testing of the new Lake Huron water source and managing construction activities at the plant in advance of connection to connecting to the KWA line that's currently under construction.

Some council members questioned City Administrator Natasha Henderson about the change order last week, but Henderson said the contract change was necessary to keep the KWA pipeline project moving forward.

"We have a nine-month contract (to purchase water from the Detroit water system)," Henderson told council members last week. "Whatever I can do to get the city to KWA," I'm doing, she said.

Council member Scott Kincaid said last week that he wasn't happy with the engineering company, "but I haven more concerns with" a possible delay in connection to the pipeline.

Councilman Eric Mays also said he was unhappy with LAN for remaining "too silent" while the city had difficulty producing water that did not violate the Safe Drinking Water Act and the Lead and Copper Rule.

Flint had purchased treated Lake Huron water from the Detroit water system for decades until April 2014 when the city began to use Flint River water until completion of the KWA pipeline.

After the discovery of elevated lead levels since that water source switch, the city returned to buying water from Detroit last month.

Council approved the change order in the LAN contract by a vote of 6-2.

Council members Eric Mays and Monica Galloway voted against the change order.

Council members Jacqueline Poplar, Kerry Nelson, Josh Freeman, Wantwaz Davis, Vicki VanBuren, and Scott Kincaid voted for it.

Councilman Herbert Winfrey was absent from the meeting.

Appeals court greenlights hearing on Flint water rate ruling (flint journal/mlive)

http://www.mlive.com/news/flint/index.ssf/2015/11/appeals_cou

By Ron Fonger | rfonger1@mlive.com The Flint Journal
on November 24, 2015 at 2:46 PM

FLINT, MI -- The Michigan Court of Appeals has turned down the city's request to delay a hearing on whether it has complied with an injunction aimed at lowering Flint's water and sewer rates.

Attorney Val Washington, who is representing Flint residents in a class action lawsuit, said Tuesday, Nov. 24, that the hearing -- scheduled for 1 p.m. Wednesday, Nov. 25 -- will go forward.

Flint City Attorney Peter Bade declined to comment on the appeals court ruling.

Washington is in court questioning whether the city is complying with Genesee Circuit Judge Archie Hayman's August injunction.

Washington said city officials miscalculated the water-rate reductions ordered by Hayman and should not be able to disconnect water customers for failuree to pay past-due bills.

The city announced earlier this month that it was starting the process of sending out thousands of disconnection notices to customers with accounts that were at least 30 days past due.

Hayman scheduled Wednesday's hearing on Washington's claims, and the city had asked the appeals court to stay that hearing.

Washington is asking Hayman to find the city in contempt of his August injunction, which rolled back rates, blocked disconnections based on bills calculated under the old rates, and required the city to repay its water and sewer fund by more than $15 million.

City officials have said the ruling could result in a municipal bankruptcy unless it is reversed or modified.

The class action lawsuit, which was prompted by Flint resident Larry Shears' Circuit Court complaint, claims the city illegally raised water and sewer rates in 2011.

Livingston County to inspect restaurant water (livingston daily)

http://www.livingstondaily.com/story/news/2015/11/24/county-inspect-restaurant-water/75923488/

Wayne Peal, Livingston Daily 11:55 a.m. EST November 24, 2015

Contract with state also covers public pools

Livingston County health officials will monitor drinking-water safety at select area restaurants under a contract approved this month by the Livingston County Board of Commissioners.

The county will receive just under $125,000 from the state to inspect well water at local restaurant sites in addition to water in public swimming pools.

The move was procedural, but water safety has emerged as a key issue statewide in light of the controversy concerning drinking water **in Flint**.

The local contract covers wells serving "about 400" local sites, including office buildings, child care centers and other facilities serving at least 25 people per day for at least 60 days a year, incuding about 90 restaurants, county environmental health Director Matt Bolang said. Though most of the money will go toward those wells, about $9,000 is earmarked to monitor pools, campgrounds and areas where medical waste may have leaked.

"It is something that we have done in the past," he said.

County water authorities, including municipal and private sources, are also inspected and issue their own reports to consumers.

The contract that went before the BOC dealt with (among other items) regulating and monitoring non-community public water supplies. These are defined as serving 25 or more people/day for at least 60 days out of the year. While restaurants on a well would meet this definition, so would office buildings, campgrounds, child care centers, etc. Any building or facility where at least 25 people/day could consume water.

Also, as part of this contract we monitor residential wells in areas adjacent to documented groundwater contamination. The medical waste piece is separate of that, and deals with the operation of facilities that generate medical waste and need to be licensed through MDEQ.

The controversy in Flint stems from heightened lead content in city water after it switched from the Detroit system to a local source for drinking water under the city's appointed emergency manager,

Under the contract, the Michigan Department of Environment Quality will pay the county department of public health to conduct the local inspections. The contract, which runs through Sept. 30, passed on a unanimous vote.

Road Salt Contaminating Drinking Water, Urban Lakes (wmuk 102.1 NPR)

http://wmuk.org/post/road-salt-contaminating-drinking-

water-urban-lakes

By Rebecca Thiele Western Michigan University 16 hours ago

Last year, the Michigan Department of Transportation used more than 650,000 tons of salt on the state's roads. That's 15 tons per person. Eventually, all of that salt washes into Michigan's lakes and streams - which could be making the drinking water in Michigan's urban areas unsafe.

For six years, Western Michigan University Geosciences Professor Carla Koretsky and her students have been studying Woods Lake in Kalamazoo. It's a good test subject because of all the runoff that flows into it from nearby streets and lawns.

In 2003, the city of Kalamazoo put up a detention wall to keep out things like fertilizer and debris. So Koretsky's team tests the water every year to see if the wall is working.

Instead of finding phosphorus or nitrogen, students have found high levels of sodium chloride - salt.

"So I right away assumed that they had made some kind of mistake, they hadn't used the instrument correctly. It was a new instrument, maybe it wasn't calibrated correctly or something like that. And so I kind of talked to them, looked at what they had been doing, looked the data, redid the sampling, redid the analysis. And sure enough those numbers were correct," says Koretsky.

Koretsky says unlike many pollutants, salt dissolves in water. So it doesn't get caught by the detention wall. She says that's a problem because it prevents the lake from "turning over."

"So you never flush fresh oxygen down into the bottom of those anoxic waters," she says.

Anoxic means little to no oxygen.

A Widespread Drinking Water Problem

This problem isn't confined to one lake, however. Tons of road salt drains into urban rivers and streams every year. A 2013 report from the Michigan Department of Environmental Quality showed that streams near urban areas - like Detroit, Grand Rapids, and Saginaw - had significantly higher chloride levels.

What's even more interesting is that Michigan has more salty lakes than the national average - even more than other upper Midwest states. That's according to the Michigan National Lakes Assessment Project in 2007.

Koretsky says the United States has increased its use of road salt exponentially since the 1940s.

"So if you go back and you look at what the salt levels were 20 and 30 years ago, it's not quite so high. It's kind of creeping effect if you like. So I think that's maybe one of the issues is that it's a slow kind of process with salinizing these lakes," she says.

So what does this all mean? Right now, Koretsky says, we don't know - but it doesn't look good. If too much salt gets into the groundwater, at best it could make a city's water less appetizing.

At worst, it could corrode old water pipes - adding toxic heavy metals to drinking water wells. Professor Marc Edwards of Virginia Tech's Environmental Engineering Department says salt is likely what caused **Flint's water** to get contaminated with lead.

"Whether that salt is coming from a man-made source or it's just naturally occurring, we're not really sure. But there is nine times more chloride, which is the key ingredient in the corrosive water that was being used in Flint River than in Lake Huron water," he says.

Edwards says there is a theory that once chloride levels in drinking water reach a certain point, you'll see a dramatic increase in lead. He says his team is seeing this in cities they're studying on the East Coast.

"Our old point of view was that, with time, the lead levels would invariably go lower and lower as the pipe got coatings on it and the lead leached from the plumbing. Instead what we're discovering is that lead in water problems are increasing and salt in water is one of the reasons for that," says Edwards.

Will this happen in your city? Edward says that depends on the chemistry of the drinking water and the age of the city's pipes. But he says most urban centers are in trouble.

"The one thing that's certain is higher chloride is bad. It eats up pipes - the iron pipes, it eats up the lead pipes, it eats up copper pipes. So this salt is having devastating economic impacts on our infrastructure. And I think if you factor in the billions and billions of dollars that are being lost from corrosion of just the water infrastructure alone, it would make people think twice - if they looked at it carefully - before they put so much salt on the roads."

Unknown Ecological Effects

What about small urban lakes like Woods Lake? WMU's Carla Koretsky says, right now, it doesn't seem like the salt is having any effect on Woods Lake. Most of the fish and other aquatic life live closer to the lake's surface. The salt sits at the bottom.

Koretsky says it could still affect microbes in the lake, but they'll have to do more research to find out. More salt could also mean more methane in the lake - a greenhouse gas that contributes to climate change. Koretsky says they're looking into that too.

Surprisingly, Koretsky says there hasn't been much research into the effect of road salt in the United States. In many ways, her team is leading the way. They received a grant from the MDEQ to do further research on Woods Lake and similar lakes in the area.

“This is new territory in a way," she says.

Possible Solutions

Salt is certainly the most popular way to keep ice off of roads in big cities, but there are alternatives. Koretsky says, unfortunately, every de-icer has its downsides. Take sand, for example:

“In addition to the problem of turbidity and sediment in the lakes, when you drive over sand a lot of the fine particles go in the atmosphere. That can be a real problem with respiratory ailments. There are problems with respect to damage of the roads. So it’s more expensive in terms of having to kind of clear it at the end of the season and potentially also having the lifetime of road be less. So that’s very expensive as well. So sand is not a terrific alternative, although it is relatively inexpensive.”

Koretsky says other de-icers are less effective or more expensive than salt. Many of them still pollute lakes and streams in one way or another.

Some experts say Michigan should still use salt, just use less of it. The Michigan Department of Transportation is currently working on a project to reduce runoff from the state’s roads and use salt more efficiently. Hal Zweng manages MDOT’s stormwater program:

“We’ve done studies to try to determine the best speed for the trucks to operate when they spread salt on the road to try to minimize the amount that just bounces and scatters off the road. We pre-wet the salt which helps it stick to the road surface when it goes down rather than have it scatter as much. And we also accelerants, chemicals to the salt to help it start acting faster.”

But de-icing expert Mark Cornwell says the state could be doing more. Cornwell worked in the ice control business for about six years before starting Sustainable Salting Solutions, LLC. Now he helps municipalities around the country manage their road salt.

Cornwell says using more salt brine would reduce the amount of salt on the roads and save cities money. He says salt brine - salt dissolved in water - only uses about 120 pounds of salt per lane mile. That would save about 3,800 pounds of salt per year in Michigan.

“Solid salt doesn’t melt anything. It basically has to come in contact with water, pull heat off the pavement and start to create brine. So, in some instances that can be a challenge. And so by kind of going around that phase of the solid to liquid, you’re in to a more immediate effect,” says Cornwell.

Newer salt trucks would also help. Cornwell says MDOT has been forced to use old equipment that doesn’t place salt on the roads as precisely as newer models.

Our elected leaders must stand up to

polluters (the times herald)

leaders-must-stand-polluters/76333806/

Commentary by Marika Sinnis 4:58 p.m. EST November 24, 2015

Al Jazeera recently published the first in a three-part series examining Wisconsin's water resources, drawing international attention to its woeful contemporary environmental record under the governorship of Scott Walker.

Michigan's similar poor water quality record is reflected in **the Flint's recent water crisis**, with no immediate action taken by Gov. Snyder. But thanks to senators like Debbie Stabenow and Gary Peters, we might be able to have protections for waterways at the federal level.

Senators Stabenow and Peters have shown their continued support for clean drinking water in our state over the past month. During the first week of November, they voted against two attacks on the EPA's Clean Water Rule which restores Clean Water Act protections to over 23,000 miles of Michigan's waterways and the drinking water sources for more than 1.4 million Michiganders.

The safety of our drinking water is, after all, contingent upon our elected officials' political will to stand up to those who would pollute freely.

Michigan is lucky to have such leaders who can help give federal protections to waterways.

When I sit down for Thanksgiving dinner this week, I will give thanks for the work that our senators are doing to protect our waterways.

As you recall, Tom P and I talked with Richard Benzie and Liane at the end of August about the State doing a voluntary consumer education about lead in drinking water. And Liane said they would pursue this (documented in our meeting notes). I contacted the State—Mike Prysby—at the end of October or early November to ask what the status was of this consumer education piece. I discussed the need for consumer education of lead especially in the very low-income areas of Flint that saw their children's Blood Lead Levels triple, especially for people that don't read newspaper or watch the TV news or have a smartphone. He said that it had not been done, due to competing priorities; e.g. all the FOIAs, citizen and press inquiries. He said he would look into the status of this consumer education. After several weeks of contacting him, I learned that the Michigan Dept of Health and Human Services was the lead on developing consumer education on lead.

Today I talked with Linda Dykema, a toxicologist with HHS. She said that she and her group have been working on a number of education documents. Genesee County Health Dept is helping HHS understand the needs of the citizens of Flint, such as reducing the reading levels of the HHS documents/improving the readability, and discussing with HHS the questions the citizens of Flint want answered.

HHS developed and sent out packets of information to all the schools in Flint to be distributed to every school-age child, to take home to the parents. However, these were not as effective as hoped, due to the difficulty in readability of the information. This information is being re-worked to be written at a 6th-grade level.

They have issued FAQ's, information to parents, pregnant women, and other information on lead in drinking water.

All the documents they have developed for consumer education on lead are on the website:

http://www.michigan.gov/deq/0,4561,7-135-3313_3675_73946---,00.html

Linda did say that these consumer education pieces must be vetted through the DEQ and the

Governor's office, so the process is slow.

I talked about the need for people in the low-income neighborhoods with the highest BLLs, to have information mailed to them or direct contact to get the information to EVERYONE. Linda said that Genesee County Health Dept is under resourced—funding and people. But they had a great idea, to get AmeriCorp volunteers to go into the low-income neighborhoods and go door-to-door to provide people information on how to protect themselves and their families from the lead in the drinking water. Linda thinks that this idea is moving forward, but the lack of resources may have slowed the effort. I asked about the Governor's office providing additional funding for this project, but Linda said that the Governor's office provided supplemental funding to DEQ and HHS, but she didn't think Genesee County received any supplemental funding. Linda has a call with Genesee County HD this week, so she will check on the status of this project and get back to me. She said she would see if there was something EPA could assist the CHD with.

Managing News Editor

Wednesday, December 2, 2015 - 3:01am

FLINT, Mich. — On a Saturday evening in October, several hundred trick-or-treaters streamed up and down Calumet Street on the city's east side. Traffic clogged the neighborhood's streets, lined with well-maintained Tudors, Colonials and mature trees cloaked in hues of red and yellow. Princesses, ninja turtles, witches and firemen darted between the cars, and on their front lawn, Bob and Melodee Mabbitt passed out candy from beneath a rain umbrella. The Mabbitt's stretch of Calumet is wealthier than most of Flint's neighborhoods, and draws kids from all over town on Halloween. But this year, along with Snickers, Crunch bars and boxes of Nerds, the Mabbitts were handing out leaflets.

The letters were bold and black, and they warned Flint parents their kids may have been exposed to toxic lead from their drinking water. "You are getting this as a courtesy to let you know that one or more of your neighbors had their tap water tested and was informed they have very high contents of lead and other pollutants in their water," the fliers read. Nayyirah Shariff, a Flint community organizer and friend of Melodee's, slid the white, folded fliers into dozens of old pillowcases and plastic buckets shaped like jack-o'-lanterns. "Don't worry, there's candy, too," she assured a group of kids clad in raincoats. "Happy Halloween!"

In October, Michigan Gov. Rick Snyder (R) announced the city of Flint's drinking water contained elevated levels of lead. A local pediatrician's report the week before had shown a significant jump in the number of Flint children with elevated blood lead levels, and those samples correlated with ZIP codes in which independent water samples pointed to lead contamination. State officials initially discounted the data. Eight days later, they reversed course. The city would again source its water from the Detroit River. For the residents of Flint, it was too little, too late. They had been ringing the alarm over the city's water quality for more than a year, almost immediately after the city opted to treat its water in-house from the Flint River.

Flint had already planned to join a new pipeline, the Karegnondi Water Authority, which would eventually serve mid-Michigan and the state's thumb. Knowing Flint had plans to leave, Detroit's water authority said it would stop supplying water to the city. At the time, Flint was under the control of a state-appointed emergency financial manager who, in a cost-saving move, decided that while the city waited for the KWA to come online, Flint would treat its own water for the first time in decades. Residents say officials brushed off their concerns again and again. They reported that water ran from their sinks discolored in browns, blues and yellows. Then came the hair loss, rashes that wouldn't go away, rotting teeth, discolored shower tiles. In July, the city's mayor drank a glass of water on local morning television to prove the water was safe. It wasn't.

Flint resident Lee Walters shares a photo of herself holding up a water sample taken from her sink during a city council meeting.

Ruby Wallau/ Daily

Melissa Mays, a Flint mother of four, had brought us here, to Calumet Street. Mays, her husband, and their four sons were all diagnosed with lead poisoning last year, and she's spent months working with Shariff, clergy members, activists and a ragtag collective of Flint residents to pressure the city, the state, the feds — anyone, really — to do something. In their living room, about 10 minutes from Calumet, Mays' husband applied zombie makeup to all four kids, his own face and hands already covered in the white, red and black paint. Two candelabras decorated to look like they were covered in spider webs sat atop a tablecloth patterned with skulls. I slid into a chair next to Derek and Ruby, the Daily columnist and photographer who joined me on the trip. A row of electric guitars hung vertically across one wall, and another was plastered with the kids' drawings and class projects. Mays and Shariff, who had come over for the interview, were seated on the table's long side, and I asked how the whole debacle started. Mays spoke with dizzying speed, peppering a timeline of the last two years with talk of trihalomethanes, parts per billion, Freedom of Information Act requests and the federal Lead and Copper Rule. Mays is not a scientist or policy analyst, but it was apparent that, out of necessity, this research has ended up a full-time endeavor.

Not long after water started flowing from the Flint River and into taps and showerheads across the city, residents started noticing their water running yellow and brown. It smelled funny, and tasted strange, too. People were showing up at Flint City Council meetings displaying bottles filled with the brown-colored water. "It's a quality, safe product," Flint Mayor Dayne Walling said at the time. "I think people are wasting their precious money buying bottled water." Four months later, water on the city's west side tested positive for E. coli, and the city issued a series of boil-water advisories. Shariff said she only came across the alerts accidentally when clicking around the city's website; Mays said she didn't hear about them until after the third advisory.

By September 2014, Mays had enough; she was convinced the problem was more than just bacteria. She said her cat was throwing up, her own hair was falling out and a splotchy red rash had started to stretch across her face. Mays' 2-year-old niece was staying in the house then, and every time she took a bath, the toddler broke out with a rash all over her behind. The rash covered only the body parts where the tub's water hit. Eczema cream didn't help, and the child's doctor couldn't figure out what was wrong.

"And I'm like, 'What is happening to this kid?' The rest of us were just used to it. Our skin was turning scaly," Mays said. "My son — my middle child — just had rashes up and down his arms, and if you tried to put lotion on it — it just burned. It was chemical burns. It was on my face, my whole cheek bone. And any time you put anything on it, even makeup, you would just scream because it hurt so bad. But they're on T.V. saying, 'Water's safe, water's safe, water's safe.' "

AUDIO: Hear Flint residents talk about their experiences with city water.

In January 2014, the city distributed a letter notifying homeowners that the city had violated the federal Safe Drinking Water Act — not for lead, but for total trihalomethanes. The city's water was found to contain a high level of trihalomethanes — a cancer-causing chlorine byproduct. By this point, members of City Council called on the governor's appointed emergency manager to abandon the Flint River water source, and the city of Detroit offered to start selling water to Flint again. But Flint's emergency manager opted to stay the course. To investigate, residents called in a water activist, who told Mays not only that she shouldn't drink the water, but that she shouldn't cook or shower with it either. And if the city didn't have a lead problem now, he said, they would soon. Mays didn't know it at the time, but they already did.

"When you're boiling the water to make spaghetti, you're just making all of those heavy metals and all the contaminants basically bond together, and you're basically eating poison food. When you wash your clothes, the heavy metals stay in the fabrics so it's rubbing against your skin all day and god forbid you sweat, you're going to absorb all of that through your pores. So I can't wash my dishes here, I can't do my laundry, I can't move because I'm 16 years into a mortgage and nobody's going to buy my poison water house."

Mays takes us into the kids' bathroom. A five-step instruction sheet for showering was taped to the wall, written by Mays in neat, black marker. Step Two: Sit down and as the tub fills, use the cup and faucet to wash your face and hair. Rinse well. Step Four: Brush your teeth in the sink using bottled water and small cups. Don't forget Q-tips. "Love You!" is scrawled and underlined across the bottom. Next to it another reminder: "Brush Your Hair!" I asked how the kids took to the new routine. "It makes them angry, and then once we found out about the lead, I took out the letting the water fill up, so they just used a big cup to let it go over their heads," she said. "So yeah, my 17-year-old son just loves that, to sit down and use a cup to shower and to use bottled water to brush their teeth."

Mays brought in an outside expert to test the water — Marc Edwards, a professor at Virginia Tech University who specializes in water treatment. She said she drove 62 of the test kits to neighborhoods across Flint, picked them up and helped residents complete them. The lead levels in water at Flint resident LeeAnne Walters' house was averaging 2,500 parts per billion. Her family was losing hair and developing rashes, too. The legal level is 15. In a September 2015 report, Edwards concluded that the corrosiveness of Flint's water was causing lead to leach from the city's aging pipes and into the water. The state maintained it was meeting all lead and copper standards.

An empty lead and copper water sampling bottle in the office of the The Flint Water Plant.

Ruby Wallau/ Daily

On Sept. 24, Dr. Mona Hanna-Attisha, a University alum and a pediatrician at the Hurley Medical Center Children's Clinic in Flint, cross-referenced that data with information the county already had — blood lead levels for infants at ages 1 and 2, which the state is required to test for kids who are at a greater risk of ingesting lead paint chips in older homes. What she found: The number of children in Flint with elevated blood lead levels — defined as 5 micrograms per deciliter or more — had increased from 2.1 percent in the 20 months prior to Sept. 15, 2013, to 4 percent between Jan. 1 and Sept. 15, 2015. In several ZIP codes, those figures increased from 2.5 percent to 6.3 percent during that same time period.

"Everyone who has challenged the narrative — which was 'the water is safe to drink' — they were minimized," Shariff said.

But the evidence built up, and eventually it was hard to ignore there was a problem. Finally, on Oct. 8, 2015 — nearly two years after Flint residents started drinking water from the Flint River — the state changed course and announced they had come up with a $12 million deal to allow the city to return to Detroit water. “I’m in full support of the return to the Great Lakes Water Authority,” Snyder said during the announcement. “We all care about the citizens of Flint.” Snyder promised to convene a task force — which includes a University professor and several University alums — that would determine what went wrong. Detroit water would again run through Flint’s pipes, and Flint’s parents could rest easy knowing their kids’ drinking water was safe.

But Mays says people shouldn’t be so quick to chalk the case up as a crisis averted. The story of water in Flint is not confined to that period of two years when the city’s water was unsafe for drinking — or by the final hurrah moment in October when the good guys fighting the good fight won the day. Flint’s challenges also reach further, into a history colored by the population loss and decay that made it easy to brush the city aside, as well as into a future that these two years will in many ways shape.

A timeline of Flint's water struggles.

Design by Emily Schumer

On the banks of the Flint River

You could argue the city of Flint, like a lot of cities, was born from the river. The confluences between city and water stretch back far — to a time when native people fought over the river’s banks. A handful of fords, where the river could be easily traversed, made the land highly sought after. In 1819, before the great industrial might of Buick City generated wealth and helped the city’s population grow, and before the city’s slide into poverty and decay, a fur trapper and his wife set up a post near the river’s banks. For the traders who came here — and to Michigan, a territory hugged on four sides by the Great Lakes — water was life-giving. The rivers provided habitat to beavers, and the water ferried birch-bark canoes downstream, piled up with pelts for sale back East and across the vast Atlantic.

In later years, Michigan’s rivers and lakes were clogged with logs, floated downstream for processing into lumber that would build this nation’s cities. The water fed the state’s growing agricultural economy as well as the companies that empowered the United States’ industrial might — industries that allowed old lumber towns across the Rust Belt to boom, before they would hemorrhage wealth and population a few decades later. Today, water is the basis for Michigan’s wildly successful “Pure Michigan” advertising campaign, which helps drive the state’s vibrant tourism industry in the towns dotting Lake Michigan. For a whole lot of Michiganders, their Michigan and their Midwest does not include the vast and aging networks of pipe that snake beneath the earth, nor the sediment-colored water of the rivers Rouge, Flint, Detroit and Saginaw.

“We connect to water very emotionally, we love our water, it’s Pure Michigan, it’s why that ad campaign really sings to us,” John Austin, a University of Michigan lecturer and co-author of a report on Michigan’s ‘Blue Economy,’ told me during a phone interview later in the week. “And so we appreciate that even more than this hidden water infrastructure that brings us clean water and is essential to basic life and health.”

Today, one in five jobs in Michigan are linked to water, and Austin said the state could play a major role in developing innovative ways to use water more efficiently, particularly as water resources grow increasingly strained. But as much as Michiganders — residents of a state whose surrounding Great Lakes contain 20 percent of the world’s surface freshwater supply — love their water resources, Austin says it’s easy to forget about the hidden infrastructure that delivers fresh water to taps on demand.

“What Flint really illustrates is … as a first order of business, we depend on water for life and that water has to be clean and available to people,” he said. “What Flint exposed is our water infrastructure — that in every community in Michigan we’ve got aged infrastructure and this shows that since we haven’t invested in remaking our water infrastructure — in rebuilding those systems — they can potentially kill us.”

For Austin, this dynamic illustrates the need to invest not only in infrastructure above ground, such as roads and bridges, but also in the infrastructure that sits below the surface. With debate over paying to fix Michigan’s roads reaching a boiling point last spring, Austin said people should be just as concerned with the invisible infrastructure — particularly the pipes that shepherd clean drinking water into our homes every day.

The Flint Water Plant is quiet now that all of the Flint River water has been emptied from the plant and the city returns to Detroit Water.

Ruby Wallau/ Daily

Through the pipes, below the ground

After Halloween, I spent a week trying to get into Flint's water plant. When I spoke to Mike Glasgow, the city's utilities director, on the phone, he told me how excited he was to hear young people were interested in municipal water delivery. But in the days leading up to the final reporting trip to Flint, the woman who handles his schedule kept telling me to call back later; she hadn't had a chance to nail anything down. By Thursday evening, I wasn't getting any response at all. I decided I would just show up at the facility anyway.

The Flint Water Treatment Plant sits on a sprawling campus just off the freeway. The complex is circled with tall chain-link fencing topped with barbed-wire spirals. A long driveway leads up to the main building, which is sand-colored and doesn't boast much in the way of decorative finishes. A white water tower hulks above the building, around which another half-dozen smaller structures are gathered. Only a handful of cars congregated in the parking lot, and a sign in one of the front windows indicated the office entrance is around back. Inside, the plant's office was drab and dated. Paper maps hang on the paneled walls, and a collection of empty lead and copper water sampling bottles rest on a shelf nearby. I found Brent Wright, the plant's supervisor, in an office lined with dozens of binders. Wright looked understandably confused when we enter. "Hi, we're here for a tour of the plant," I said enthusiastically. "Mike knows we're coming." I only half-lied. I started to sweat a bit when he dialed up Glasgow to make sure the story checked out, but when Wright hung up the phone, he told us, "The best place to start is from the beginning."

Flint's first water treatment plant was built in 1917. The original red brick building stands a few hundred yards from the present facility, and looks a lot like an abandoned automobile factory. Many of the square panes of glass are smashed in, and Wright tells me the roof collapsed a few years back. The city built a second facility, the current plant, in 1952, but it would only operate fully until 1967, when the city stopped treating its own water and started buying it from Detroit. During the peak of Flint's prosperity and population, when sprawling factories turned thousands of GM cars off production lines, both plants together pumped 100 million gallons of water per day. Today, with most of those factories shuttered and the city's population significantly depleted, the Flint plant was only pumping about 16 million gallons daily when it last operated in October. In 1960, 196,940 people lived in Flint, according to the U.S. Census. Today, 99,002 people call this 33-square-mile city home.

With the city back on Detroit water, there wasn't much going inside Flint's water treatment plant during the visit. The final gallons of Flint River water had just been emptied out the week before. A few construction workers wearing hard hats moved through the massive building's darkened cement corridors, getting the place ready for the KWA pipeline to go live a few years down the road. The process for cleaning and distributing water is not incredibly simple. Wright is well versed in it after 25 years working his way up at the plant. First, the water is pumped from the river. Until it's pumped back out of the factory as clean drinking water, that's the only part of the process that isn't propelled by gravity. From there, the water is lifted into chambers for ozone treatment, created by putting together electricity, oxygen and nitrogen, which kills much of the bacteria.

The Flint Water Plant is quiet now that all of the Flint River water has been emptied from the plant and the city returns to water from the Detroit river.

Upstairs, where generators create this ozone, I asked why didn't the plant know there would be a corrosion problem, and add corrosion control into the process. Water is corrosive by nature, but after years of industrial waste dumped into the river, it was especially so. "Basically, by being a softening plant, we didn't think we were going to need corrosion control," Wright said. "It was brought up in a meeting and the DEQ said, 'No, let's wait and see what your lead and copper sampling is and then we'll look into corrosion control.' " Wright went on to say that the switch back to Detroit was unnecessary and that the city could have handled the problem on its own. "Yeah, we could have taken care of it," he said. "We're doing it now. We're setting up corrosion control now because they're saying this water has stripped some of the heavy phosphates out of the pipes over this last year that had built up when we were on Detroit water, so we're adding more phosphates."

Wright led us through the plant's laboratory, where glass jars, beakers, lab coats and clipboards lined the walls. From there, we followed a series of dim hallways into a massive room where sediment is removed from the water. A catwalk stretched across a giant reservoir-like chamber I figured could hold the water of several dozen swimming pools. Without the lights on, seeing the bottom proved difficult, even as we moved across the walkway suspended directly over it. Back when water was still held here, enormous paddles would have rotated through the water, pushing sediments to the bottom and separating them from the clean water. Peering down into the empty vat felt like standing on a deserted basketball court after the floodlights have been turned off and the crowds have all gone home.

While Wright kept talking about turbidity, lime and filtration, I couldn't get over the bigness of the whole thing — not only the millions of gallons that once moved through this place each day, but also the weightiness of the task at hand. That charge — to ensure the safety of the water that makes its way into your toddler's bathtub, mixes your baby's formula and washes down your grandpa's heart medicine — is clearly a heavy burden, a task that's unquestionably important to get right.

Policy failure

The debate over what happened in Flint will likely continue for some time. The governor has convened an independent task force to investigate, and the EPA is releasing their own report on the situation. A recent Michigan Radio report suggested the state told city officials to leave two incredibly high water samples off their official water test report — allowing recorded lead levels in the water to remain below the legal threshold. Many of the sources said they thought officials should be fired, and some should get jail time for what happened in Flint. I had hoped to ask Walling, Flint's mayor, about all of this, but his press secretary instead offered Howard Croft, head of the city's Department of Public Works. Walling had the day before received an early punishment from the city's residents: His bid for re-election was defeated.

A few days after Croft asked to reschedule the interview, he resigned. "It is with deep sadness that I tender my immediate resignation," the longtime Flint resident appointed to oversee the water switch wrote in a statement. "With the city engaged in transition and working to regain public trust, I believe that now is the right time for me to step down from this position."

It's hard to argue that elected and appointed officials didn't majorly drop the ball on a lot of levels. Whether that's the result of negligence, malintent or political weakness, people disagree. Edwards, the Virginia Tech professor, says it was the Michigan Department of Environmental Quality's job to ensure the city managed the switch appropriately. Glasgow, the utilities manager, said the state told him to take two particularly high samples off his report. "They instructed me to take it off the report," he told Michigan Radio in October. "I don't know that I can give you a good enough answer to tell you why they decided to remove it from the report." The house those samples came from? LeeAnne Walters'.

Walters said the city was also padding its reporting with loopholes in the federal Lead and Copper Rule that allowed the city to pre-flush the water for five minutes before taking a sample and to use narrow-mouthed bottles that required a slower water stream and wouldn't show accurate lead readings. She said those loopholes must be closed, and she's already lobbying government officials to do so. A Detroit pastor recently filed an unsuccessful petition with the state Board of Canvassers to get a proposal on the ballot to recall Snyder for his failure to intervene in the water crisis. Several lawsuits have also been filed, including one in which Mays is listed as a complainant and another class action suit against Snyder, Walling and 10 other state and local officials, including Croft and Glasgow.

"What (we) would say is that we're focused on moving forward and ensuring public health and clean, safe drinking water," Snyder's press secretary Sara Wurfel told The Flint Journal after the filing. "The governor has outlined a detailed multiple step action plan for both immediate, mid and long term."

No resignations are going to alleviate the scars left by lead. But as finely woven as this issue is — with complicated timelines, players and literal chemical equations — maybe it's actually pretty simple. Government officials messed up big time, and a majority Black city with some of the state's poorest residents had to pay for it. No matter how you spin it, public policy failed. Officials did not serve the people they had promised to protect.

I thought about what Walters said at her kitchen table when I asked her whether she thought the mayor didn't step in because he didn't want to or because he didn't have enough power to do anything. "That's a loaded question," she told me. "I've debated that with people many times. I always get the, 'Well, in politics…' Well I don't want to hear about politics. Every politician has a human side, and I don't care what the politics of it is. Knowing that children were being poisoned, you stand up and you do what's right, and if you don't do that, then you don't deserve to hold the position that you have. You are there because the people put you there. You should be doing what your citizens need to do. Even if you don't have the power to make a change, you have a voice, you stand with your people."

Flint resident Lee Walters demonstrates the slow water stream used by the the city to pad its federal Lead and Copper tests in her relatives kitchen on Nov. 6, 2015.

Ruby Wallau/ Daily

Beyond all the blame passing, if we can't expect and trust that our drinking water — a resource people literally can't live without — will be clean and safe, then Flint residents have started asking who and what can we trust? I would imagine that's what a lot of folks in Flint are thinking through when they wake up to brush their teeth or wash their faces before bed. And that has incredible ramifications.

"I think there's a serious trust issue in this community," Hanna-Attisha said. "We're in 2015, we're in the middle of the Great Lakes and we don't have access to safe drinking water. And we trust that our government regulates these things. There's rules that will ensure that public health is protected. It's mind-boggling that it's not. And if these rules are not going to be strengthened or enforced, then the public needs to take it on their own to make sure that they have access."

In Flint, change occurred when residents, not public officials, called foul. "Our residents were complaining for months and months that their water was brown, it smelled bad, it tasted bad, there was E. coli in it and in other communities with louder, more affluent voices, it wouldn't have lasted this long," Hanna-Attisha said.

I asked Mays if she thought this would have happened in a place like Bloomfield, Ann Arbor or Farmington Hills, the city where I'm from. With a median household income of $24,834, Flint is a city where 41.5 percent of residents live below the poverty line. She cut in before I could finish. "No."

"People don't want to acknowledge that there's been a problem," Shariff said. "This isn't like a hurricane where stuff is happening that you have no control over. This isn't an act of god."

Mays interrupts her. "This problem is man-made."

Though the problem was finally illuminated, it was not by government regulators, health officials or elected leaders, but by regular people like Mona Attisha-Hana, Melissa Mays and LeeAnne Walters. Attisha-Hana is a pediatrician. Mays does PR for a radio station. Walters is a stay-at-home mom. The community forced action from the city and state. Sure, residents acted with the interests of their own kids in mind, but also seem to have been driven by something bigger: by a sense that they owed something to their neighbors.

I wonder whether the dynamic in Flint — where the community was forced to serve as sole government watchdog — will simply become the new paradigm there, or whether the events of the last two years will spur some kind of wake-up call reverberating through city halls, water treatment plants, statehouses and governor's mansions all across the country.

Future in Flint

For Mays, the switch back to Detroit water hasn't changed much in her day-to-day life. The family still runs all their drinking water through a blue filter they keep on the fridge's top shelf. The corrosive river water likely wore away the phosphate coating on the city's lead pipes — and that could take years to build back up again. There are also the physical markers left by lead.

"Well now, my kids got to get tutors," Mays said on Halloween, as her kids prepared their costumes in the next room over. "I talked to my son's teacher this week and he's struggling in algebra, something he did great in before all this. My youngest, same thing. My middle child, has since he was younger, they've always wanted to bump him up, bump him up. He's got his first C and I'm beyond furious. Not to mention the physical things. My oldest has two holes in his teeth, on the smooth sides. That doesn't happen unless your teeth and crumbling from the inside out and the dentist said that's because of the lead poisoning. And they're all adult teeth, so what's he supposed to do, get dentures? And then the fact that my son fell off his bike and he had two buckle fractures on his wrist from catching himself, just falling over. That means his bones are weak. He complains all the times about how his bones hurt. 'My back hurts, my leg hurts, Mom.' Because you have severe bone pain with lead poisoning and I've got the same thing.

"I feel horrible. I want to help them, and there's nothing I can do as a mother and that infuriates me because people did this to us, people allowed it to continue to happen, they didn't speak up. The citizens who are sick spoke up and that's not our job, but it's become our lives and there's people worse off than me who can't afford the medications, can't afford the extra doctors."

Hanna-Attisha says the costs of Flint's water debacle will have ripple effects decades and generations down the road.

"When the kid is 5, they're going to need special education, when that kid is 10, they're going to get an ADHD diagnosis and have behavior problems," Hanna-Attisha told me during one of our telephone conversations. "And when that kid is 16, they're going to have problems with the criminal justice system. Imagine what that does to an entire population. So we have just shifted the entire population curve — their IQ curve. We've lost all of our high-achieving 130 kids who are going to go to U-M, who are going to come up with the next cure for cancer and we have now tons more kids with low 70 range who need more remedial services. As a population, it is absolutely damning. The state thinks they solved the problem when they went back to Detroit water. The money they gave is a down payment. This is a long-term problem."

"Those are dreams derailed," Shariff told me. "Because people have hopes and aspirations and because being exposed to lead and copper, they're going to have to create a new paradigm."

Whether lead poisoning will necessarily land a whole generation of kids in jail, it's hard to know. But a lot of the problems wrought by Flint's water crisis aren't going to fade away easily. Their appearance in The New York Times, and on the policy agendas of government officials very well might, but the physical and emotional ramifications will likely linger for a long time. Walters, who recently relocated to Virginia but returns to Flint to keep stoking the fight for clean water, isn't letting her kids drink the tap water in their new home. Not until it's tested, at least. Even outside of Flint, one of her sons has started asking whether the water is safe to drink each time he wants to drink a glassful.

By 7:00 on Halloween, the rain wasn't letting up on Calumet Street, and it was starting to get dark. Mays asked if we wanted to walk with her for a while longer. Mayor Walling, who lives a couple blocks over on Court Street, was up for re-election on Tuesday, and Mays had plenty of door hangers to hand out for that cause, too. I was hungry and needed to go to the bathroom, so we declined. I didn't want to do any of those things in Flint, in the city where the water had been poison.

We got in the car, set the GPS for home, and left Calumet. We left the Mays family, the trick-or-treaters, the Flint River and the whole city behind us. Our Chevy barreled down U.S.-23 toward Ann Arbor — where that night I would turn on my faucet to wash my hands, fill my lazily cleaned pots with water, rinse off dishes stained with Prego and then let the shower's hot water pour over my face, settling into the metal drain below my bare feet. I envisioned the water rushing through the walls and then under the city's streets, houses and parking lots, moving through the pipes like some kind of trick-or-treat ghost.

Flint's new mayor has laid out her priorities for her first hundred days in office. Not surprisingly, the plan largely reflects the issues she stressed in her campaign.

"I'm not trying to do it by myself," Flint Mayor Karen Weaver told a small audience at city hall, "I need all of you, and the people that are out there, to help."

Credit Steve Carmody / Michigan Radio

Karen Weaver defeated incumbent mayor Dayne Walling in last month's election. She's been on the job for nearly a month.

Even though roughly a quarter of her first hundred days have passed, the mayor says now was a good time to update people on her plans for her first 100 days.

A top priority for the mayor is having Flint's problem plagued water system declared a federal disaster. The decision to switch the city from Detroit water to the Flint River lead to numerous problems, including high lead levels in the drinking water.

Mayor Weaver says she's talked with Michigan U.S. Senators Debbie Stabenow and Gary Peters about the problem. She hopes to recruit other congressional and state lawmakers to help lobby for the designation.

Along with fixing Flint's water, Weaver says during her first hundred days she wants to make progress toward returning the city to total local control.

Flint was run by an emergency manager, appointed by the governor, for much of the past four years. The last emergency manager left in April. But decisions by elected city officials can still be overruled by a transition advisory board. Weaver hopes to hasten the end of that last level of state oversight.

Weaver says there are other issues she wants to address during her first 100 days in the mayor's office, including a review of Flint's still wobbly city finances and the creation of programs for the city's children.

Weaver admits not everything in her 100 day agenda will be completed in her first 100 days. She also admits she needs help.

"I'm not trying to do it by myself," Weaver told a small audience at Flint city hall, "I need all of you, and the people that are out there, to help."

MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

Contact: Jennifer Eisner 517-241-2112

For Immediate Release: December 3, 2015

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with elevated blood lead levels.

The report covers test results reported to MDHHS since the state action plan was put in place Oct. 2. It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at www.michigan.gov/flintwater and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

In the third quarter of 2010, 8.3 percent of Flint children 6 and under showed elevated blood lead levels. The figure gradually decreased to 4.1 percent in the third quarter of 2013. During the same months in 2014, the figure increased to 7.5 percent and decreased to 6.4 percent in the third quarter of 2015.

Last month, MDHHS collaborated with the county health department and local partners to distribute educational resources and informational letters to Flint parents regarding lead testing. The state is providing funding for GCHD nurses to work with families when an elevated blood lead level has been detected. During these follow-up visits, nurses coordinate with environmental health investigators to meet with families in their homes to identify lead exposures, address questions and provide water filters. People can be exposed to lead from paint, soil, plumbing and other sources.

MDHHS continues to provide free water filters and replacement cartridges to Flint residents at four locations, including the MDHHS Flint offices and the Genesee County Community Action Resource Department. For a full list of locations and hours of distribution, visit www.michigan.gov/flintwater.

To help residents properly install water filters, and to demonstrate how to replace the original when it expires, MDHHS has created an instructional video on its YouTube channel. For updates, visit www.michigan.gov/flintwater.

It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at www.michigan.gov/flintwater and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

In the third quarter of 2010, 8.3 percent of Flint children 6 and under showed elevated blood lead levels. The figure gradually decreased to 4.1 percent in the third quarter of 2013. During the same months in 2014, the figure increased to 7.5 percent and decreased to 6.4 percent in the third quarter of 2015.

Last month, MDHHS collaborated with the county health department and local partners to distribute educational resources and informational letters to Flint parents regarding lead testing. The state is providing funding for GCHD nurses to work with families when an elevated blood lead level has been detected. During these follow-up visits, nurses coordinate with environmental health investigators to meet with families in their homes to identify lead exposures, address questions and provide water filters. People can be exposed to lead from paint, soil, plumbing and other sources.

MDHHS continues to provide free water filters and replacement cartridges to Flint residents at four locations, including the MDHHS Flint offices and the Genesee County Community Action Resource Department. For a full list of locations and hours of distribution, visit www.michigan.gov/flintwater.

To help residents properly install water filters, and to demonstrate how to replace the original when it expires, MDHHS has created an instructional video on its YouTube channel. For updates, visit www.michigan.gov/flintwater.

MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

Contact: Jennifer Eisner 517-241-2112

For Immediate Release: December 3, 2015

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with elevated blood lead levels.

The report covers test results reported to MDHHS since the state action plan was put in place Oct. 2. It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at www.michigan.gov/flintwater and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

Thank you for your November 6, 2015 letter regarding the U.S. Environmental Protection Agency's Flint Safe Drinking Water Task Force.

As a result of your letter, we have scheduled weekly calls to brief your staff on the work that the EPA Task Force is doing to provide technical assistance to the State of Michigan and the City of Flint. During those calls we have discussed the Task Force's work with the State and the City to optimize corrosion control for the Flint system, following the decision to switch to drinking water supplied by the Great Lakes Water Authority. We have also discussed the work that the Task Force is doing to help the State and City prepare for the planned switch to water supplied by the Karegnondi Water Authority in 2016. We will continue to provide weekly briefings on Task Force activities for as long as your staff finds the briefings to be useful.

Thank you again for your letter . . .

Loan forgiveness sought for Flint to replace lead pipes

Chad Livengood, Detroit News Lansing Bureau 12:07 a.m. EST December 6, 2015

The Michigan Department of Environmental Quality is in talks with Flint officials about financing forgivable loans to replace lead-leaching water pipes while U.S. Rep. Dan Kildee is pursuing federal forgiveness for the city's nearly $21 million in past loans for drinking water infrastructure improvements.

Kildee said Friday he wants the U.S. Environment Protection Agency to forgive Flint's debt to a federally-funded clean drinking water loan fund to free up money for the cash-strapped city to invest in replacing aging water lines linked to elevated lead levels in the blood of some Flint children and adults.

Lead leached from Flint's water pipes between April 2014 and October when the city was pumping its drinking water from the corrosive Flint River. In October, after Flint doctors found children exposed to lead poisoning, the city switched its water source back to Detroit's treated Lake Huron water.

"(Flint) could use that money for new improvements that will help offset the damage that was done by this terrible mistake because it did have permanent impact not just on people but on the system itself," Kildee said Friday after a taping of WKAR-TV's "Off The Record."

Kildee, D-Flint, said Flint also could use the debt relief to lower water rates for residents.

"They pay almost the highest amount for the worst water," Kildee said.

Flint's four past loans for drinking water infrastructure improvements come from a state-managed fund at the Department of Environmental Quality.

But the EPA would have to approve forgiving the old loans, DEQ spokesman Brad Wurfel said.

"We can do loan forgiveness at some level on new loans, and we are discussing this possibility with the city of Flint," Wurfel said Friday.

The EPA has already agreed to let the DEQ finance new forgivable loans for Flint to replace private water service lines running up to homes that are old and leaching lead into the city's drinking water, Kildee said.

"They need to move forward on that," Kildee said of DEQ.

DEQ has asked Flint officials for studies and documentation about the city's needs, assessment management and capital improvement plans for its underground water service system, Wurfel said.

Gov. Rick Snyder's administration pledged in October to assist Flint in a long-term replacement of water service lines with lead in the pipes damaged by the corrosive Flint River water.

At Snyder's request, the Legislature quickly appropriated $6 million to cover half of the $12 million cost to reconnect Flint to Detroit's water. The Snyder administration also freed up $1 million to provide free faucet water filters residents to remove lead.

DEQ Director Dan Wyant discussed new loans for replacing water lines that could be forgiven during meetings Thursday and Friday with newly elected Flint Mayor Karen Weaver and other city officials, Wurfel said.

Kildee also said Friday he's pushing for Snyder to establish a health care fund for the long-term needs of as many as 7,000 Flint children who may have been exposed to lead poisoning in the city's water.

The Democratic congressman wants the Republican governor's administration to create a database tracking the health and nutrition of Flint children potentially harmed by lead-tainted water. Such an effort by state government "is not a big lift," Kildee said.

"We ought to be able to do that," Kildee said. "We know who they are."

Snyder spokesman Dave Murray said the governor's Flint water task force is preparing a long-term plan for dealing with the city's water problems.

"We expect the group's report to include a set of recommendations moving forward," Murray said Friday in an email. "State agencies also are continuing with Gov. Snyder's action plan, which includes distributing filters and continuing testing and other steps that will help Flint with its water infrastructure challenges."

Flint residents can get more information about getting their water tested for lead or getting a free water filter online at www.michigan.gov/flintwater or by calling (810) 787-6537.

All Stories

FLINT, MI — You may have thought Flint's lead in water crisis was drawing to a close, but the Hurley Medical Center doctor who played a critical role in ending the city's use of the Flint River has other plans.

"I am not going to sit back and just see what happens ... so that in 20 years these Flint kids will (have been) nothing more than statistics on the consequences of lead poisoning," said Dr. Mona Hanna-Attisha.

"We can sit back and do nothing, but we have an incredible opportunity to do something," she said.

The director of Hurley Medical Center's Pediatric Residency Program, whose research first showed rising levels of lead in the blood of Flint children, is expanding her data-driven work and also pushing to create a model public health program here — one aimed at offsetting the damage that's been caused by high levels of lead in water.

A mother of two who learned pediatrics as a medical student in Flint 15 years ago, Hanna-Attisha went public with her research on blood lead levels in infants and children on Sept. 24, a time when city officials were still insisting that the city's drinking water was safe and state government officials initially questioned the validity of her work.

One day after the release of the study, former mayor Dayne Walling, who pushed the ceremonial button to change the city's water source from Detroit to the Flint River, joined in declaring a public health emergency in response to spiking lead in water levels.

Within two weeks of the study's release, Gov. Rick Snyder announced a plan for financing the city's reconnection to the Detroit water system and praised the doctor's work.

Today, Hanna-Attisha is working on two fronts: to further monitor blood lead levels, as well as providing better tracking of victims of lead exposure and pushing for better support services for children who have been exposed to elevated lead levels.

An investigative team is looking for lead in the blood on every baby born at Hurley and tagging the medical records of every child who was exposed to Flint water since April 2014.

With support from the Hurley Foundation, it's also updating and breaking down data on blood lead levels, work that could make it easier to identify which areas of the city have the worst lead problems.

"We are going to assess the heck out of what happened ... We're not done," Hanna-Attisha said. "We failed at preliminary prevention so now we have to move to secondary prevention."

When children's files are tagged, exposure to lead becomes a part of their medical history, prompting doctors to consider lead as a possible factor in health problems and to potentially offer services they otherwise might not such as nutrition counseling.

Good nutrition, including foods rich in iron, calcium and Vitamin C can help protect the body from the effects of lead, according to the U.S. Environmental Protection Agency.

"These patients and their families have been traumatized. They need that extra support, that extra empathy," said Hanna-Attisha, who believes the city can be an ideal place to build a model public health program.

Marc Edwards, the Virginia Tech professor who led independent water testing in Flint, said the doctor has already shown the resolve to achieve her goals.

"Dr. Mona upholds the highest standards of scientific rigor and integrity in analysis of raw data, considering its implications for public health, and forging consensus with all parties for rational decisive interventions," Edwards said in an email to The Flint Journal-MLive.

"Her passion, work ethic and pleasant persistence provide an inspiring example that other young 21st Century public health professionals should emulate. Without the extraordinary efforts of Dr. Mona and her colleagues, Flint's children would undoubtedly still be in harms way — her plans to ameliorate the damage from this tragedy, should be carefully considered and then implemented with some urgency."

Hanna-Attisha said better public education about lead is still needed and residents need to know that Flint's drinking water is still not safe to drink without a filter, even though the city changed its water source last month.

It will take more time to rebuild the protective coating inside lead water pipes, Hanna-Attisha said, and there is the potential for scale and sediment containing lead to break loose and enter the water supply in the future.

Just last month, the U. S. Environmental Protection Agency warned that underground work by utility crews could dislodge lead in scale and sediment in water pipes.

Grant applications are pending to help support the work Hanna-Attisha wants to do here, and state and federal programs need to be fitted to take Flint's lead problem into account.

One example of a change made to address lead exposure in Flint was the federal government's decision to make ready-to-use formula available through the Women Infants and Children program so that mothers don't have to mix powdered formula with water.

Lead is a naturally occurring element found in small amounts in the earth's crust, according to the EPA. The Mayo Clinic says even small amounts of lead can cause serious health problems, and children under the age of 6 are especially vulnerable to lead poisoning, which can severely affect mental and physical development.

Hanna-Attisha said lead poisoning is especially tragic in Flint, where too many children are already exposed to other traumas — such poverty and alcohol or drug abuse in the home — before lead in water was added to the list.

As the number of traumatic events increases, so does the risk of health problems for children, she said.

"We are assessing what happened, but we also want to see how we can mitigate this exposure," the doctor said.

Flint tap water "still not safe" says Virginia Tech researcher (Michigan Radio)

http://michiganradio.org/post/flint-tap-water-still-not-safe-says-virginia-tech-researcher#stream/0

By Steve Carmody • Dec 2, 2015

ShareTwitter Facebook Google+ Email

A top researcher says it's still too soon to drink Flint's tap water unfiltered.

Dr. Marc Edwards of Virginia Tech University (file photo)

Credit Steve Carmody / Michigan Radio

Virginia Tech University researcher Marc Edwards has been studying Flint's water problems for months. Tests conducted by Edwards' team on water samples from more than 250 Flint homes showed elevated levels of lead.

Edwards has been in Flint this week testing tap water in ten 'sentinel' homes. He says the tests are tracking what's happened in the six weeks since Flint switched back to Detroit water, after 18 months of getting tap water from the corrosive Flint River.

"The average lead has gone down by about 50%. So that's good news," says Edwards.

But Edwards says the bad news is there's still too much lead in the water.

"(The water is) still not safe to drink by any stretch of the imagination," says Edwards.

Edwards predicts Flint's drinking water will continue to improve over the next few weeks. He says people should continue to use water filters for the foreseeable future.

However, Edwards says lead will continue to be an issue in Flint for a long time to come.

Loan forgiveness sought for Flint to replace lead pipes (Detroit News)

Chad Livengood, Detroit News Lansing Bureau 12:07 a.m. EST December 6, 2015

(Photo: John M. Galloway / Detroit News)

160 CONNECTTWEET 2 LINKEDIN 22 COMMENTEMAILMORE

The Michigan Department of Environmental Quality is in talks with Flint officials about financing forgivable loans to replace lead-leaching water pipes while U.S. Rep. Dan Kildee is pursuing federal forgiveness for the city's nearly $21 million in past loans for drinking water infrastructure improvements.

Kildee said Friday he wants the U.S. Environment Protection Agency to forgive Flint's debt to a federally-funded clean drinking water loan fund to free up money for the cash-strapped city to invest in replacing aging water lines linked to elevated lead levels in the blood of some Flint children and adults.

Lead leached from Flint's water pipes between April 2014 and October when the city was pumping its drinking water from the corrosive Flint River. In October, after Flint doctors found children exposed to lead poisoning, the city switched its water source back to Detroit's treated Lake Huron water.

"(Flint) could use that money for new improvements that will help offset the damage that was done by this terrible mistake because it did have permanent impact not just on people but on the system itself," Kildee said Friday after a taping of WKAR-TV's "Off The Record."

Kildee, D-Flint, said Flint also could use the debt relief to lower water rates for residents.

“They pay almost the highest amount for the worst water,” Kildee said.

Flint’s four past loans for drinking water infrastructure improvements come from a state-managed fund at the Department of Environmental Quality.

But the EPA would have to approve forgiving the old loans, DEQ spokesman Brad Wurfel said.

“We can do loan forgiveness at some level on new loans, and we are discussing this possibility with the city of Flint,” Wurfel said Friday.

The EPA has already agreed to let the DEQ finance new forgivable loans for Flint to replace private water service lines running up to homes that are old and leaching lead into the city’s drinking water, Kildee said.

“They need to move forward on that,” Kildee said of DEQ.

DEQ has asked Flint officials for studies and documentation about the city’s needs, assessment management and capital improvement plans for its underground water service system, Wurfel said.

Gov. Rick Snyder’s administration pledged in October to assist Flint in a long-term replacement of water service lines with lead in the pipes damaged by the corrosive Flint River water.

At Snyder’s request, the Legislature quickly appropriated $6 million to cover half of the $12 million cost to reconnect Flint to Detroit’s water. The Snyder administration also freed up $1 million to provide free faucet water filters residents to remove lead.

DEQ Director Dan Wyant discussed new loans for replacing water lines that could be forgiven during meetings Thursday and Friday with newly elected Flint Mayor Karen Weaver and other city officials, Wurfel said.

Kildee also said Friday he’s pushing for Snyder to establish a health care fund for the long-term needs of as many as 7,000 Flint children who may have been exposed to lead poisoning in the city’s water.

The Democratic congressman wants the Republican governor’s administration to create a database tracking the health and nutrition of Flint children potentially harmed by lead-tainted water. Such an effort by state government “is not a big lift,” Kildee said.

“We ought to be able to do that,” Kildee said. “We know who they are.”

Snyder spokesman Dave Murray said the governor’s Flint water task force is preparing a long-term plan for dealing with the city’s water problems.

“We expect the group’s report to include a set of recommendations moving forward,” Murray said Friday in an email. “State agencies also are continuing with Gov. Snyder’s action plan, which includes distributing filters and continuing testing and other steps that will help Flint with its water infrastructure challenges.”

Flint residents can get more information about getting their water tested for lead or getting a free water filter online at www.michigan.gov/flintwater or by calling (810) 787-6537.

Subject: Action requested Flint Corrosion Control Optimization Assessment

Task Force –

Bob has requested that, for the Friday (12/11) call with Flint, its contractor, and MDEQ, we provide him with a bottom line Task Force position on the corrosion control treatment optimization assessment work that must be accomplished before Flint begins to distribute water from the new KWA pipeline to the public. He is looking for a timeframe that they should be planning for where they may need access to both Detroit water (current situation) and KWA water. We have suggested that the KWA water should be run through the Flint plant and the treated water tested for corrosion control treatment optimization for a period of time while the resulting water run to waste. Bob is asking how long they should plan for that to continue.

We should discuss this and arrive at a group position tomorrow. Can we have a call tomorrow at 3PM central to discuss this? I will send out a scheduler message with call in information.

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

Tim, et. al.

Darren and I had a conversation with Tom Speth a few minutes ago, he is on detail with OGWDW. I mentioned (I'll take the heat for this suggestion) to him that it would be helpful to have someone with more plant operations experience than me, do at least a walk-through "audit" of the treatment plant, to look for yellow or red flags for potential start-up or operations issues. We thought that there was possibly someone in TSC/OGWDW who could help. Maybe they would spot things like filter media, process instrumentation or controls, etc. that inform on what to monitor closely, and what water quality parameters (inorganic, organic and microbial) might need enhanced monitoring in the system as the plant is brought on line. I am not sure where this will go, but I've made the suggestion in the spirit of getting the most EPA expertise on behalf of the people of Flint. So, don't be surprised. I don't want this to get any more complicated than it has to be, but I'm also very nervous (as is Darren) about the potential things that can go wrong with a conventional treatment plant, aside from the corrosion control. And basic problems with pH, Al residual, organic removal,etc. can all adversely interact with the corrosion control, particularly at the elevated (compared to other systems, but rightfully so) phosphate dosage level.

I can probably make the call at 3, but I believe Darren is busy the whole afternoon. I have essential tasks and meetings both in the 9-10 AM timeframe, and also from noon until 3.

--Mike

We have suggested that the KWA water should be run through the Flint plant and the treated water tested for corrosion control treatment optimization for a period of time while the resulting water run to waste. Bob is asking how long they should plan for that to continue.

We should discuss this and arrive at a group position tomorrow. Can we have a call tomorrow at 3PM central to discuss this? I will send out a scheduler message with call in information.

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

Tim;

We are largely in the dark about very important details about the configuration of the Flint plant and startup plans. What coagulant? Is ozone going to be used? What water quality changes would accompany intermittant chlorine addition at the intake for zebra mussel control (impact on pH? TTHMS? Other constituents?)? We don't know anything more about the chlorine residual in the system, what the pH impact is (if any, hopefully none) since the boost in phosphate? In what ways would the new Flint product water (and Genesee county plant in the future) equal or differ from the current Detroit water? As you heard on the call yesterday, DEQ still doesn' t understand the relationship of chloride to corrosion (too busy just attacking Marc Edwards for exposing the problems?), or any other water quality/corrosion inhibition interactions. If the Flint plant has to change coagulants, do they have the proper chemical feed, flocculation and filtration media to accommodate changes in coagulant? I am very uncomfortable continuing to have to make major decisions while being in the dark about capabilities and practice. Changes in plant operation must be tested full scale.

This is also complicated because we don't know of the "track record" of this engineering consultant, since they have no national prominence. Who have they solved problems for? What were the results? Darren and I have our reservations about level of expertise in some areas, but perhaps they have some expertise that we just don't know about.

--Mike

Potential Options for Corrosion Control Treatment Optimization Assessments 12-10-2015.docx

Hi all,

As requested, attached are four potential options for the treatment optimization assessment for task force consideration. If there are any additional options, information or clarifications, please advise asap so that we can get this information out to everyone for discussion.

I do not consider 3 and 4 realistic options. Part of the assessment needs to include a demonstration that the full-scale plant can consistently and reliably be operated, produce a consistent water quality that also meets the regulations, and that water does not upset lead. 3 and 4 do not address these points not to mention would be logistically extremely difficult. Running a pilot at the source would be a good idea in helping to define full-scale operation, however.

Sorry I was out yesterday -some lingering issues caused by that cold.

Is Option 2 a realistic option? This relates to one of my ongoing issues. We don't know what is going on with Genesee County or the other system that is switching to the KWA pipeline in terms of their treatment processes, timing of switch, and testing prior to making the switch to the KWA source. Option 2 presumes that Genesee County is not switching to the KWA pipeline source on the same timeframe as Flint and will continue to use Detroit water (if true, I assume this is so they can evaluate their treatment plant effectiveness prior to bringing it on-line with KWA water). Do we know that Genesee County will remain on Detroit water when the KWA pipeline comes on-line? If we don't know, we need answers from MDEQ in terms of the timing of Genesee County's switch to KWA water, their anticipated treatment train, and any pre-switch testing to inform our decisions about Flint and its assessment.

I will work with Andrea.
Just FYI - We have no resident-requested sample results, except for the ones that Citizen name / Ex. 6 sent me (hers and 3 others). That was on the request list that I sent to the Task Force some time ago and it seems to have been forgotten, or at least I have not heard back on the status of that information request. Was it discussed at all on Friday?

Hi Miguel,

Instead of constructing a very large reservoir, have you considered buying/renting a smaller tank (e.g. commercially available 5k gallon poly tank or 20k gallon frac tank) and having daily or weekly water truckloads of Lake Huron water (such as from the Detroit intake)?

http://www.rainforrent.com/Products/Tanks-and-Boxes/Frac-Tanks/?utm_source=bing&utm_medium=cpc&utm_campaign=frac&utm_term=frac%20tank%20rental

http://www.bakercorp.com/en-us/products/tanks/poly-tanks/poly-tanks-overview/

Based on past project experience, these tanks are typically around $1,000/month to rent. If sufficient room is available indoors, I would suggest the poly tank option to avoid heating/recirculation that would be needed for a frac tank [which is the size of a semi truck and would probably not fit indoors].

Let me know if you would like additional information on this idea.

Thanks,
Val

Task Force –

Bob has requested that, for the Friday (12/11) call with Flint, its contractor, and MDEQ, we provide him with a bottom line Task Force position on the corrosion control treatment optimization assessment work that must be accomplished before Flint begins to distribute water from the new KWA pipeline to the public. He is looking for a timeframe that they should be planning for where they may need access to both Detroit water (current situation) and KWA water. We have suggested that the KWA water should be run through the Flint plant and the treated water tested for corrosion control treatment optimization for a period of time while the resulting water run to waste. Bob is asking how long they should plan for that to continue.

We should discuss this and arrive at a group position tomorrow. Can we have a call tomorrow at 3PM central to discuss this? I will send out a scheduler message with call in information.

From: Lytle, Darren
Sent: Mon 12/14/2015 12:35:44 PM
Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

The sticking point is the assessment that includes developing confidence that the plant can be started-up and operated consistently for an extended period of time before the water is permitted to enter the distribution system. Will the plant be able to produce the targeted finished water quality on a consistent basis? Without any experience treating Lake Huron water and considering how treatment of Flint River water went in past, I think this is questionable.

This is a full-scale exercise and I do not think a reservoir option would be practical.

Subject: RE: flint article --> "Flint will pay for independent water tests, added phosphate treatment"

Just reminding everybody that item 5.1 in our proposed research plan covered the detection of lead service lines (since so few of the 40,000 records have any viable materials information on them according to Mike G). Item 5.3 on our plan was set up to determine the fraction of lead coming from the different materials in the system, to enable an assessment of the effectiveness of current and future "corrosion control" treatment effectiveness. The school sampling has proven that lead pipes are not necessarily the only important source of lead contamination.

Subject: flint article --> "Flint will pay for independent water tests, added phosphate treatment"

Hi All,

Here's another article on Flint:

Source = http://www.mlive.com/news/flint/index.ssf/2015/12/flint_will_pay_for_independent.html

“Flint will pay for independent water tests, added phosphate treatment

FLINT, MI -- The city has hired a contractor to do what it did not on its own -- search out and test water in homes that are most likely to have the highest lead levels.

Mayor Karen Weaver and City Administrator Natasha Henderson announced the city will spend up to $75,000 to locate and test for lead in water in at least 150 homes and businesses served by lead service lines, which are most prone to leech lead into drinking water.

Professional Service Industries Inc. will also test water samples from Flint in its own labs, which are certified by the state and federal governments.

Weaver and Henderson also said the city has begun to boost the volume of phosphates in Flint water by adding more of the mineral once water arrives here through the Detroit water system pipeline.

"I'm really happy about today ... really pleased ... This is a move forward for us," Weaver said in a news conference Thursday, Dec. 10. "This is a way to increase public confidence ... We're going above and beyond what's required."

The decision to hire PSI to test water from high-risk homes comes after a Flint Journal-MLive story in November showed Flint officials disregarded federal rules that required them to seek out homes at high risk for elevated lead levels while doing their own water sampling earlier this year.

The city certified to state regulators earlier this year that its water samples came from homes where residents were at the highest risk of lead poisoning.

Records obtained by The Journal, however, showed those claims were false and that water samples were in most cases taken from homes with non-lead service lines or from homes for which the city had no information about the transmission line material.

Flint Utilities Director Mike Glasgow said Thursday that it's possible the city will have to excavate some service lines to be sure of what the lines are made of.

Flint officials have said the city's utility records are in disarray and not easily accessible, stored on about 40,000 hand-written index cards and maps.

"I doubt we will be able to do them all without digging up at least a few lines," Glasgow said.

Glasgow had told the City Council earlier this week about the plan to boost phosphates by adding 2.5 milligrams per liter -- on top of 1 milligram per liter that's added by the Detroit water system.

Weaver said the higher level of phosphates is designed to lower lead levels and to aid in rebuilding a protective coating -- or scale -- that makes pipes less prone to lead leaching.

The city has said the coating in water pipes was damaged during the 17 months that the city used the Flint River as its water source because of how corrosive the river was.

The state Department of Environmental Quality has said it should have required the city to treat the river water to make it less corrosive before Flint was reconnected to the Detroit water system last month.

Henderson said the contract with PSI will cost as little $40,000 and not more than $75,000."

Thanks,

Andrea Porter

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

My biggest concern here is that we have insufficient information to evaluate the options I sent out. We do not even know (at least I don't) where the Flint connection to the Genesee/Detroit pipeline will be and whether it will be before or after the shut-off between Detroit and Genesee. If it is after the shut-off, the water will not even be available to Flint once Genesee cuts it off. We need to get some maps from Flint asap on how these interconnections would work before we can decide on what options are actually even possible and for how long.

What do you folks think about a hybrid, whereby the reservoir is used until the KWA source is available at the plant? The advantage is that we can start on that now instead of having to wait until the KWA pipeline is completed. It's not perfect since it would involve adjusting the reservoir water to what would be anticipated to come out of the pipeline and applying various treatment schemes, but it could potentially allow for a shorter evaluation timeframe after the switch to KWA, which could save millions of $$ for Flint.

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

Hi all,

As requested, attached are four potential options for the treatment optimization assessment for task force consideration. If there are any additional options, information or clarifications, please advise asap so that we can get this information out to everyone for discussion.

Subject: Action requested Flint Corrosion Control Optimization Assessment

Task Force –

Bob has requested that, for the Friday (12/11) call with Flint, its contractor, and MDEQ, we provide him with a bottom line Task Force position on the corrosion control treatment optimization assessment work that must be accomplished before Flint begins to distribute water from the new KWA pipeline to the public. He is looking for a timeframe that they should be planning for where they may need access to both Detroit water (current situation) and KWA water. We have suggested that the KWA water should be run through the Flint plant and the treated water tested for corrosion control treatment optimization for a period of time while the resulting water run to waste. Bob is asking how long they should plan for that to continue.

We should discuss this and arrive at a group position tomorrow. Can we have a call tomorrow at 3PM central to discuss this? I will send out a scheduler message with call in information.

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

I've already given up that the pipe rig will be there for anything but stabilization with current water to be then used for future KWA water and beyond evaluations. But I don't know if it will ever get funded. The hybrid option would rely on even more funding from somewhere, though I do agree that it would be a lot less money to even build a small package plant to simulate Flint plant operations with enough volume to feed pipe rigs, than to pay $1M a month for Detroit water. But I don't see funding for that, either, though it may be possible to design something technically feasible.

This whole problem of best practices vs. the weak regulatory requirements is shedding light on another massive aspect of the failure of the LCR. And for that matter, probably other regs, that don't prevent wanton experimentation on the public.

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

My biggest concern here is that we have insufficient information to evaluate the options I sent out. We do not even know (at least I don't) where the Flint connection to the Genesee/Detroit pipeline will be and whether it will be before or after the shut-off between Detroit and Genesee. If it is after the shut-off, the water will not even be available to Flint once Genesee cuts it off. We need to get some maps from Flint asap on how these interconnections would work before we can decide on what options are actually even possible and for how long.

What do you folks think about a hybrid, whereby the reservoir is used until the KWA source is available at the plant? The advantage is that we can start on that now instead of having to wait until the KWA pipeline is completed. It's not perfect since it would involve adjusting the reservoir water to what would be anticipated to come out of the pipeline and applying various treatment schemes, but it could potentially allow for a shorter evaluation timeframe after the switch to KWA, which could save millions of $$ for Flint.

Subject: RE: Action requested Flint Corrosion Control Optimization Assessment

The sticking point is the assessment that includes developing confidence that the plant can be started-up and operated consistently for an extended period of time before the water is permitted to enter the distribution system. Will the plant be able to produce the targeted finished water quality on a consistent basis? Without any experience treating Lake Huron water and considering how treatment of Flint River water went in past, I think this is questionable.

This is a full-scale exercise and I do not think a reservoir option would be practical.

I am not sure what the actual issues are from ORD with this option, so I don't know what problem(s) we are trying to solve yet.

Darren/Mike - Can you please outline the specific issues you folks have with Option 3 (using a temp reservoir for starting the KWA water assessment).

Hi Miguel,

Instead of constructing a very large reservoir, have you considered buying/renting a smaller tank (e.g. commercially available 5k gallon poly tank or 20k gallon frac tank) and having daily or weekly water truckloads of Lake Huron water (such as from the Detroit intake)?

http://www.rainforrent.com/Products/Tanks-and-Boxes/Frac-Tanks/?utm_source=bing&utm_medium=cpc&utm_campaign=frac&utm_term=frac%20tank%20rental

http://www.bakercorp.com/en-us/products/tanks/poly-tanks/poly-tanks-overview/

Based on past project experience, these tanks are typically around $1,000/month to rent. If sufficient room is available indoors, I would suggest the poly tank option to avoid heating/recirculation that would be needed for a frac tank [which is the size of a semi truck and would probably not fit indoors].

Let me know if you would like additional information on this idea.

Thanks,
Val

Subject: RE: FYI / Flint Journal: More lead in plumbing found at Flint, Michigan, Brownell school, state report says

It is interesting that elevated Pb levels are found even after switching back to the supposedly-"optimized" Detroit water. Hopefully, the additional phosphate added to Flint water starting last week will hasten improvement, but there are national cases where the phosphate does not entirely shut down the galvanic corrosion component of the lead leaching. One of our recommended studies is to continue to look at the different categories of lead sources in residential plumbing fed by Flint water (and relevant also to Genesee County and other water supplies to be impacted by water source and treatment changes), to make sure that they're all covered by the current and future water treatment configurations.

I am suspicious that the Detroit water is not really optimized, given the phosphate dosage is only about a third of what the 1995 pilot study tested (and multiple concentrations were not tested), and the determination that the lowered dosage isn't showing higher lead levels for Detroit (and is therefore cost-effective) could easily be explained by a skewed site selection and sampling protocol, if theirs is similar to what has been implemented in Flint.

Does anyone know if there is there a plan or schedule for the completion of faucet/device replacement for the schools? This article doesn't lay it out. And is there a plan to identify the lowest Pb leaching models to be put into the schools? That is important, as "lead free" does not mean absence of lead release.

I would recommend that. I have a gut feeling the issue isn't just Michigan.

It may be complicated/costly to really check, but since the success of the current and future LCR depends on accurate site selection, it needs to be grappled with, sooner or later. Sometimes the seemingly simplest assumptions of a reg turn out to be the critical flaws in practice.

Subject: RE: FYI / Flint Journal: More lead in plumbing found at Flint, Michigan, Brownell school, state report says

It is interesting that elevated Pb levels are found even after switching back to the supposedly-"optimized" Detroit water. Hopefully, the additional phosphate added to Flint water starting last week will hasten improvement, but there are national cases where the phosphate does not entirely shut down the galvanic corrosion component of the lead leaching. One of our recommended studies is to continue to look at the different categories of lead sources in residential plumbing fed by Flint water (and relevant also to Genesee County and other water supplies to be impacted by water source and treatment changes), to make sure that they're all covered by the current and future water treatment configurations.

I am suspicious that the Detroit water is not really optimized, given the phosphate dosage is only about a third of what the 1995 pilot study tested (and multiple concentrations were not tested), and the determination that the lowered dosage isn't showing higher lead levels for Detroit (and is therefore cost-effective) could easily be explained by a skewed site selection and sampling protocol, if theirs is similar to what has been implemented in Flint.

Does anyone know if there is there a plan or schedule for the completion of faucet/device replacement for the schools? This article doesn't lay it out. And is there a plan to identify the lowest Pb leaching models to be put into the schools? That is important, as "lead free" does not mean absence of lead release.

Subject: MI Dept of Health and Human Services

As you recall, Tom P and I talked with Richard Benzie and Liane at the end of August about the State doing a voluntary consumer education about lead in drinking water. And Liane said they would pursue this (documented in our meeting notes). I contacted the State—Mike Prysby—at the end of October or early November to ask what the status was of this consumer education piece. I discussed the need for consumer education of lead especially in the very low-income areas of Flint that saw their children's Blood Lead Levels triple, especially for people that don't read newspaper or watch the TV news or have a smartphone. He said that it had not been done, due to competing priorities; e.g. all the FOIAs, citizen and press inquiries. He said he would look into the status of this consumer education. After several weeks of contacting him, I learned that the Michigan Dept of Health and Human Services was the lead on developing consumer education on lead.

Today I talked with Linda Dykema, a toxicologist with HHS. She said that she and her group have been working on a number of education documents. Genesee County Health Dept is helping HHS understand the needs of the citizens of Flint, such as reducing the reading levels of the HHS documents/improving the readability, and discussing with HHS the questions the citizens of Flint want answered.

HHS developed and sent out packets of information to all the schools in Flint to be distributed to every school-age child, to take home to the parents. However, these were not as effective as hoped, due to the difficulty in readability of the information. This information is being re-worked to be written at a 6th-grade level.

They have issued FAQ's, information to parents, pregnant women, and other information on lead in drinking water.

All the documents they have developed for consumer education on lead are on the website:

http://www.michigan.gov/deq/0,4561,7-135-3313_3675_73946---,00.html

Linda did say that these consumer education pieces must be vetted through the DEQ and the Governor's office, so the process is slow.

I talked about the need for people in the low-income neighborhoods with the highest BLLs, to have information mailed to them or direct contact to get the information to EVERYONE. Linda said that Genesee County Health Dept is under resourced—funding and people. But they had a great idea, to get AmeriCorp volunteers to go into the low-income neighborhoods and go door-to-door to provide people information on how to protect themselves and their families from the lead in the drinking water. Linda thinks that this idea is moving forward, but the lack of resources may have slowed the effort. I asked about the Governor's office providing additional funding for this project, but Linda said that the Governor's office provided supplemental funding to DEQ and HHS, but she didn't think Genesee County received any supplemental funding. Linda has a call with Genesee County HD this week, so she will check on the status of this project and get back to me. She said she would see if there was something EPA could assist the CHD with.

Hi Jen,

I'll try and catch you before you leave but yes, I've been working on health info re: orthophosphate - not for Genesee Cty HD but rather at the request of Tim Henry. Also, Heather asked me to respond to a citizen call (Citizen name / Ex. 6 so I'm preparing something for him today. Turns out ATSDR, USEPA-Cinc., and MDHHS developed an orthophosphate factsheet which is in the MDHHS signoff chain. I have the draft copy…

Since requests are coming in from various sources, I suggest that we cc each other on all Flint-related items to avoid duplication or conflicting info.

Thanks,

Kim

Hi, Kim—I heard that you have received a request for health effects info from Genesee Cty HD. I also received a request for similar info from MI Dept of Health and Human Services. This is the draft response I've prepared—needed a couple of things from Miguel and haven't touched base with him. Would you be able to send me what you sent to Genesee Cty HD? I hear that the State and the County don't talk ☺.

Jen

Hi, Linda. Thank you for talking with me today. I talked with several of our lead experts here in our office.

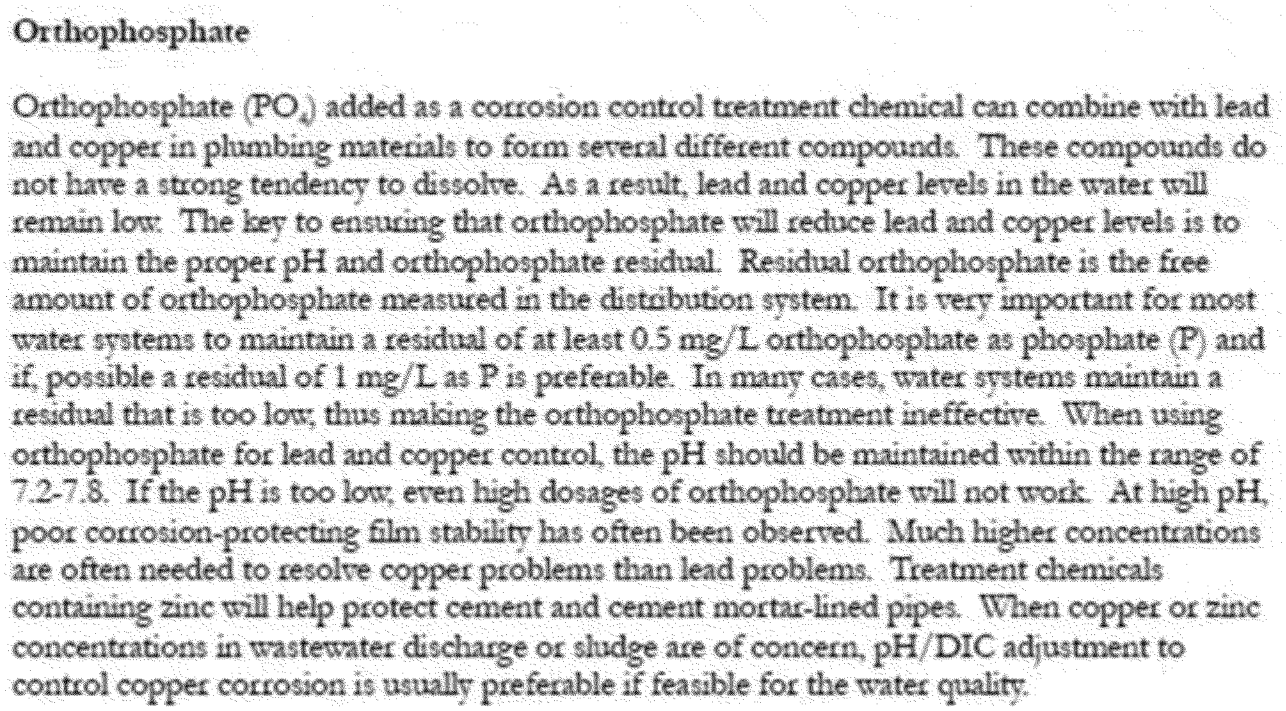
dykemal@michigan.gov

How do phosphates work to reduce lead in drinking water?

Orthophosphate is a chemical that is added to drinking water to control corrosion of water distribution pipes. The Orthophosphate combines with lead and copper in plumbing materials to form a protective coating on the inside of the pipes which will prevent lead from leaching into the drinking water.

intro orthophosphate info

Source: http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100999U.txt



Orthophosphate

Orthophosphate (PO$_4$) added as a corrosion control treatment chemical can combine with lead and copper in plumbing materials to form several different compounds. These compounds do not have a strong tendency to dissolve. As a result, lead and copper levels in the water will remain low. The key to ensuring that orthophosphate will reduce lead and copper levels is to maintain the proper pH and orthophosphate residual. Residual orthophosphate is the free amount of orthophosphate measured in the distribution system. It is very important for most water systems to maintain a residual of at least 0.5 mg/L orthophosphate as phosphate (P) and if, possible a residual of 1 mg/L as P is preferable. In many cases, water systems maintain a residual that is too low, thus making the orthophosphate treatment ineffective. When using orthophosphate for lead and copper control, the pH should be maintained within the range of 7.2-7.8. If the pH is too low, even high dosages of orthophosphate will not work. At high pH, poor corrosion-protecting film stability has often been observed. Much higher concentrations are often needed to resolve copper problems than lead problems. Treatment chemicals containing zinc will help protect cement and cement mortar-lined pipes. When copper or zinc concentrations in wastewater discharge or sludge are of concern, pH/DIC adjustment to control copper corrosion is usually preferable if feasible for the water quality.

Does the adding of phosphates have a bad effect on health?

The phosphate that is added to the drinking water is NSF certified, meaning it is not harmful to human health to add to drinking water.

Here is a link explaining the NSF/ANSI 60 Standard:

http://www.nsf.org/services/by-industry/water-wastewater/water-treatment-chemicals/nsf-ansi-standard-60

The standard is used to certify that chemicals added for water treatment meet health effects criteria. It’s one way that you could help explain the safety of using orthophosphate for corrosion control, in terms of human health effects.

Does phosphate reduce the effectiveness of the faucet filter that is removing the lead from the drinking water?

Will the filter get clogged from the addition of phosphates to reduce corrosion in the pipes?

Consumer Actions to Reduce lead in drinking water

http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=20001R4V.txt

Linda—question: When you talk with Genesee County, I was wondering if the results of recent Blood Lead Levels of 1 and 2 year olds, is showing that the BLLs are going down, since residents are now using filters and Flint changed back to Detroit water.

Also, when Genesee County HD starts its AmeriCorp volunteer door-to-door campaign, I think it would be beneficial to prioritize the low-income areas of Flint first, since they are the areas with the highest Blood Lead Levels and the areas with people that might not have access to electronic news information, such as computers, smartphones, TVs.

Subject: Breakdown of research plan studies

When you folks can get past the congressionals and get back to editing the research plan after our call last week, here is my suggestion on the breakdown of the studies:

Essential Corrosion Control Studies (for any system, size can be scaled to fit construction practices and number of connections)

5.1

5.2 (too late for 5.2.1, need to equilibrate pipes to be ready for 5.2.2, plus, systems should *leave pipe rigs in operation in flow-through mode* so that they are ready for any future treatment or source changes, and also to do ongoing periodic verification monitoring that Pb release has not been affected by more subtle background water chemistry changes.

5.3 Absolutely essential to optimize properly

5.7 You have to know what's on the pipes to determine what are permissible corrosion control treatment choices, and there needs to be verification that the mechanisms of protection are either what was expected, or not. This prevents problems like DC. We've been able to give some utilities timely advice as to what NOT to do, through this. Nobody knows what is really the mechanism in Detroit and which will probably be happening in Flint.

Health-related studies

5.6 Fixing wimpy language for LSL threats and both soluble and particulate release and dangers of water quality changes and disturbances, are public health necessities. Better messaging is needed to get customer-side LSLs replaced.

5.4 The amount of this problem will depend on community vacancy rates and actual metal leaching and inhibition mechanisms.

5.5 This is a huge need for evaluation of health threat and impacts.

EPA says it won't take quick action on petition targeting Flint water safety

By Ron Fonger | rfonger1@mlive.com The Flint Journal
on December 11, 2015 at 6:05 PM, updated December 11, 2015 at 6:07 PM

FLINT, MI -- The U.S. Environmental Protection Agency won't act immediately on a petition that seeks to involve it more deeply in Flint's water crisis.

EPA Regional Administrator Susan Hedman told the Natural Resources Defense Council in a Dec. 10 letter that regulators will wait to act on the request "until such time as the agency determines that corrosion control treatment is fully optimized for the Flint system."

The NRDC petition, filed on Oct.1 on behalf of several organizations, urges EPA to order Flint to reconnect to the Detroit water system and to require other actions necessary to protect the health of city residents.

Since the filing of the filing of the petition, there have been several developments involving Flint water, including reconnection to Detroit water

and more widespread testing for lead.

"In light of the actions that the state and the city have taken during the past several weeks, EPA could arguably conclude that your petition fails to meet the jurisdictional prerequisites set forth in ... the Safe Drinking Water Act," Hedman's letter says.

Anjali Waikar, staff attorney for the NRDC, said a public health emergency remains in Flint and EPA "hasn't done enough to ensure safe drinking water."

Despite a reconnection to the Detroit water system, a public health emergency remains in place in Flint as the city attempts to rebuild a protective mineral coating in water transmission lines during the next few months.

From April 2014 until October, the city used the Flint River as its source of water but was not required to treat it to make less corrosive, causing lead to increasingly leach into the water supply.

Earlier this week, the city announced it has begun boosting the amount of phosphate to the

Detroit water it is receiving in an effort to better control corrosion and rebuild mineral scale that keeps lead from leaching as quickly.

Thanks for hunting this down!

Unless the media knows something that is not included in this report, they are likely misinterpreting the 'phosphate' listed as orthophosphate. I see nothing in this report that would indicate they considered corrosion control which is pretty stunning. The 'phosphate' listed is very likely just polyphosphate, since phosphate and polyphosphate are often used interchangeably and the use of polyphosphate is referred to by LAN in a more recent document.

Mike,

Thanks so much for all the documents you sent. I had seen the "City of Flint Water Supply Assessment, February 2013" previously. When I looked at it today, I found that the document I was looking for was listed on page 6 which is the "Analysis of the Flint River as a Permanent Water Supply for the City of Flint, 2011." After some Googling and subscribing to SCRIBD.com, I found the attached documents which are the report and its appendices. Neither document considers corrosion control treatment as a parameter to be addressed, although a cost estimate for phosphate addition is included in Appendix 8. I'm not sure if Flint followed any of the recommendations in this report before switching sources. What I have found interesting is that the "City of Flint Water Supply Assessment, February 2013", which was conducted by the Michigan State Treasurer's Office, recommended that Flint continue buying water from Detroit, but the State Emergency Manager(s) allowed Flint to contract with the Karegnondi Water Authority. Politics anyone?

Subject: RE: Flint River Study

Hi, George;

This is all that I have, and I don't think there ever was a competent, technical study done to focus on the corrosion control impacts. These studies were aimed at water quantity aspects, except the one that looked at THMs. I am thinking that the 2013 Water Supply Assessment document attached may be the study referenced on the flintwaterstudy.org web site. The study was commissioned in 2011 but finished in 2013. No mention of corrosion control for lead, though.

The mistake made to go from Detroit to Flint River water was predictable with the knowledge of even 30-35 years ago. You can't put a water with a pH of 7.5 or so into a system full of lead pipes. End of story. And certainly not put it into brass and soldered copper with a boatload of chloride, on top of the low pH. The central problem is that the LCR framework cannot currently prevent the implementation of knowingly incompetent, stupid technical decisions. States are generally powerless to stop it, even if they know better. And sometimes they either don't know better, or don't care. This situation was both. State guidance is to pre-flush for 3-4 minutes before LCR sampling stagnation (Flint instructions said 5 minutes), 6-8 hours standing with no use from that faucet, then add it to many houses having plastic interior plumbing because either old galvanized pipe failed or copper was stolen during vacant periods. Additionally, there was no verification that sites sampled actually met the targeting criteria of the LCR. This is a clinic on LCR flaws.

The consultants, DEQ and Flint apparently all thought that "lime softening" was sufficient for corrosion control, though they did not take into account that using recarbonation to lower the pH by a couple of units undid any benefit. Plus, quick calculations Darren did from monthly operating data suggested wild swings in pH (though always too low) and carbonate concentration, so that whole process was out of control.

The Veolia report reflects a scary lack of concern about the lead. They suggested saving lime and reducing softening, but focused on TTHMs and the aesthetic aspect of discolored water from iron corrosion and main breaks. Their suggestion was POLYPHOSPHATE addition as a partial solution, absolutely the worst thing they could do for lead on top of the low pH.

Subject: Flint River Study

Miguel,

I've been following the Flint lead issue mainly by checking the flintwaterstudy.org web site. In one of the articles posted there that I read last week, which I can't find now, it was mentioned that the City of Flint in 2011 had a contractor prepare a report on what would be needed if they began to use the flint River as a permanent source. It was further stated that the City submitted this report to the Michigan DEQ sometime in 2013. However, it appears that the DEQ did not consider the report when they allowed Flint to switch sources. I'm wondering if you have seen this 2011 report, and if so, could you send me a copy. I'm really curious about the report's recommendations, as a source switch like Flint's is probably a rare occurrence. I think that we might want to clarify what may be needed to approved a source change as part of the LCRLTR and/or LCR guidance. The 2011 report might be helpful in considering what might be needed in the LCR and its guidance.

I know that you're on the Flint work group so there's no rush to send me the report if you have access to it. Thanks.

Subject: RE: Flint River Study

Hi, George;

This is all that I have, and I don't think there ever was a competent, technical study done to focus on the corrosion control impacts. These studies were aimed at water quantity aspects, except the one that looked at THMs. I am thinking that the 2013 Water Supply Assessment document attached may be the study referenced on the flintwaterstudy.org web site. The study was commissioned in 2011 but finished in 2013. No mention of corrosion control for lead, though.

The mistake made to go from Detroit to Flint River water was predictable with the knowledge of even 30-35 years ago. You can't put a water with a pH of 7.5 or so into a system full of lead pipes. End of story. And certainly not put it into brass and soldered copper with a boatload of chloride, on top of the low pH. The central problem is that the LCR framework cannot currently prevent the implementation of knowingly incompetent, stupid technical decisions. States are generally powerless to stop it, even if they know better. And sometimes they either don't know better, or don't care. This situation was both. State guidance is to pre-flush for 3-4 minutes before LCR sampling stagnation (Flint instructions said 5 minutes), 6-8 hours standing with no use from that faucet, then add it to many houses having plastic interior plumbing because either old galvanized pipe failed or copper was stolen during vacant periods. Additionally, there was no verification that sites sampled actually met the targeting criteria of the LCR. This is a clinic on LCR flaws.

The consultants, DEQ and Flint apparently all thought that "lime softening" was sufficient for corrosion control, though they did not take into account that using recarbonation to lower the pH by a couple of units undid any benefit. Plus, quick calculations Darren did from monthly operating data suggested wild swings in pH (though always too low) and carbonate concentration, so that whole process was out of control.

The Veolia report reflects a scary lack of concern about the lead. They suggested saving lime and reducing softening, but focused on TTHMs and the aesthetic aspect of discolored water from iron corrosion and main breaks. Their suggestion was POLYPHOSPHATE addition as a partial solution, absolutely the worst thing they could do for lead on top of the low pH.

--Mike

Hi George,

I read that article but I do not have a copy of the report mentioned. Mike Schock and Darren Lytle have had more contact with the Flint folks, so I'm copying them to see if they have seen it.

Subject: Flint River Study

Miguel,

I've been following the Flint lead issue mainly by checking the flintwaterstudy.org web site. In one of the articles posted there that I read last week, which I can't find now, it was mentioned that the City of Flint in 2011 had a contractor prepare a report on what would be needed if they began to use the flint River as a permanent source. It was further stated that the City submitted this report to the Michigan DEQ sometime in 2013. However, it appears that the DEQ did not consider the report when they allowed Flint to switch sources. I'm wondering if you have seen this 2011 report, and if so, could you send me a copy. I'm really curious about the report's recommendations, as a source switch like Flint's is probably a rare occurrence. I think that we might want to clarify what may be needed to approved a source change as part of the LCRLTR and/or LCR guidance. The 2011 report might be helpful in considering what might be needed in the LCR and its guidance.

I know that you're on the Flint work group so there's no rush to send me the report if you have access to it. Thanks.

George

Subject: RE: Breakdown of research plan studies

We are close to it being pointless to extract any lead service lines for use in the pipe rigs, even for the KWA study unless we wait until Spring which will likely result in a longer timeframe Flint will have to be on Detroit water at $1M+ per month. Many folks will be off the second half of next week so by the time the funding comes and lines are excavated, the harder ground will result in more damage to the scales within the pipe. They will likely not resemble what is in the pipes out there. As much as I hate to say it, we wasted too much time on the funding. We may as well save the excavation cost and use new lead pipe.

Subject: Breakdown of research plan studies

When you folks can get past the congressionals and get back to editing the research plan after our call last week, here is my suggestion on the breakdown of the studies:

Essential Corrosion Control Studies (for any system, size can be scaled to fit construction practices and number of connections)

5.1

5.2 (too late for 5.2.1, need to equilibrate pipes to be ready for 5.2.2, plus, systems should leave pipe rigs in operation in flow-through mode so that they are ready for any future treatment or source changes, and also to do ongoing periodic verification monitoring that Pb release has not been affected by more subtle background water chemistry changes.

5.3 Absolutely essential to optimize properly

5.7 You have to know what's on the pipes to determine what are permissible corrosion control treatment choices, and there needs to be verification that the mechanisms of protection are either what was expected, or not. This prevents problems like DC. We've been able to give some utilities timely advice as to what NOT to do, through this. Nobody knows what is really the mechanism in Detroit and which will probably be happening in Flint.

Health-related studies

5.6 Fixing wimpy language for LSL threats and both soluble and particulate release and dangers of water quality changes and disturbances, are public health necessities. Better messaging is needed to get customer-side LSLs replaced.

5.4 The amount of this problem will depend on community vacancy rates and actual metal leaching and inhibition mechanisms.

5.5 This is a huge need for evaluation of health threat and impacts.

Hi Jen,

I'll try and catch you before you leave but yes, I've been working on health info re: orthophosphate - not for Genesee Cty HD but rather at the request of Tim Henry. Also, Heather asked me to respond to a citizen call (Arthur Woodson) so I'm preparing something for him today. Turns out ATSDR, USEPA-Cinc., and MDHHS developed an orthophosphate factsheet which is in the MDHHS signoff chain. I have the draft copy…

Since requests are coming in from various sources, I suggest that we cc each other on all Flint-related items to avoid duplication or conflicting info.

Thanks,
Kim

Hi, Kim—I heard that you have received a request for health effects info from Genesee Cty HD. I also received a request for similar info from MI Dept of Health and Human Services. This is the draft response I've prepared—needed a couple of things from Miguel and haven't touched base with him. Would you be able to send me what you sent to Genesee Cty HD? I hear that the State and the County don't talk ☺.
Jen

Hi, Linda. Thank you for talking with me today. I talked with several of our lead experts here in our office.
dykemal@michigan.gov<mailto:dykemal@michigan.gov>

How do phosphates work to reduce lead in drinking water?
Orthophosphate is a chemical that is added to drinking water to control corrosion of water distribution pipes. The Orthophosphate combines with lead and copper in plumbing materials to form a protective coating on the inside of the pipes which will prevent lead from leaching into the drinking water.

intro orthophosphate info

Source: http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100999U.txt

[cid:image001.png@01D12C58.43F3F260]

Does the adding of phosphates have a bad effect on health?

The phosphate that is added to the drinking water is NSF certified, meaning it is not harmful to human health to add to drinking water.

Here is a link explaining the NSF/ANSI 60 Standard:
http://www.nsf.org/services/by-industry/water-wastewater/water-treatment-chemicals/nsf-ansi-standard-60

The standard is used to certify that chemicals added for water treatment meet health effects criteria. It's one way that you could help explain the safety of using orthophosphate for corrosion control, in terms of human health effects.

Does phosphate reduce the effectiveness of the faucet filter that is removing the lead from the drinking water?

Will the filter get clogged from the addition of phosphates to reduce corrosion in the pipes?

Consumer Actions to Reduce lead in drinking water
http://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=20001R4V.txt

Linda—question: When you talk with Genesee County, I was wondering if the results of recent Blood Lead Levels of 1 and 2 year olds, is showing that the BLLs are going down, since residents are now using filters and Flint changed back to Detroit water.

Also, when Genesee County HD starts its AmeriCorp volunteer door-to-door campaign, I think it would be beneficial to prioritize the low-income areas of Flint first, since they are the areas with the highest Blood Lead Levels and the areas with people that might not have access to electronic news information, such as computers, smartphones, TVs.

Orthophosphate

Orthophosphate (PO_4) added as a corrosion control treatment chemical can combine with lead and copper in plumbing materials to form several different compounds. These compounds do not have a strong tendency to dissolve. As a result, lead and copper levels in the water will remain low. The key to ensuring that orthophosphate will reduce lead and copper levels is to maintain the proper pH and orthophosphate residual. Residual orthophosphate is the free amount of orthophosphate measured in the distribution system. It is very important for most water systems to maintain a residual of at least 0.5 mg/L orthophosphate as phosphate (P) and if, possible a residual of 1 mg/L as P is preferable. In many cases, water systems maintain a residual that is too low, thus making the orthophosphate treatment ineffective. When using orthophosphate for lead and copper control, the pH should be maintained within the range of 7.2-7.8. If the pH is too low, even high dosages of orthophosphate will not work. At high pH, poor corrosion-protecting film stability has often been observed. Much higher concentrations are often needed to resolve copper problems than lead problems. Treatment chemicals containing zinc will help protect cement and cement mortar-lined pipes. When copper or zinc concentrations in wastewater discharge or sludge are of concern, pH/DIC adjustment to control copper corrosion is usually preferable if feasible for the water quality.

In Flint, Mich., there's so much lead in children's blood that a state of emergency is declared

By Yanan Wang December 15 at 4:31 AM

Flint, Mich., resident Gladyes Williamson cries out through her tears, overwhelmed with frustration over the water drawn from the Flint River. (Jake May /Flint Journal-MLive.com via AP)

For months, worried parents in Flint, Mich., arrived at their pediatricians' offices in droves. Holding a toddler by the hand or an infant in their arms, they all have the same question: Are their children being poisoned?

To find out, all it takes is a prick of the finger, a small letting of blood. If tests come back positive, the potentially severe consequences are far more difficult to discern.

That's how lead works. It leaves its mark quietly, with a virtually invisible trail. But years later, when a child shows signs of a learning disability or behavioral issues, lead's prior presence in the bloodstream suddenly becomes inescapable.

According to the World Health Organization, "lead affects children's brain development resulting in reduced intelligence quotient (IQ), behavioral changes such as shortening of attention span and increased antisocial behavior, and reduced educational attainment. Lead exposure also causes anemia, hypertension, renal impairment, immunotoxicity and toxicity to the reproductive organs. The neurological and behavioral effects of lead are believed to be irreversible."

The Hurley Medical Center, in Flint, released a study in September that confirmed what many Flint parents had feared for over a year: The proportion of infants and children with above-average levels of lead in their blood has nearly doubled since the city switched from the Detroit water system to using the Flint River as its water source, in 2014.

The crisis reached a nadir Monday night, when Flint Mayor Karen Weaver declared a state of emergency.

"The City of Flint has experienced a Manmade disaster," Weaver said in a declaratory statement.

The mayor — elected after her predecessor, Dayne Walling, experienced fallout from his administration's handling of the water problems — said in the statement that she was seeking support from the federal government to deal with the "irreversible" effects of lead exposure on the city's children. Weaver thinks that these health consequences will lead to a greater need for special education and mental health services, as well as developments in the juvenile justice system.

"Do we meet the criteria [for a disaster area]? I don't know," she told Michigan Live. But Weaver doesn't think the city can receive the help it needs without alerting federal officials to the urgency of the matter.

To those living in Flint, the announcement may feel as if it has been a long time coming.

Almost immediately after the city started drawing from the Flint River in April 2014, residents began complaining about the water, which they said was cloudy in appearance and emitted a foul odor.

Since then, complications from the water coming from the Flint River have only piled up. Although city and state officials initially denied that the water was unsafe, the state issued a notice informing Flint residents that their water contained unlawful levels of trihalomethanes, a chlorine byproduct linked to cancer and other diseases.

Protesters marched to City Hall in the fierce Michigan cold, calling for officials to reconnect Flint's water to the Detroit system. The use of the Flint River was supposed to be temporary, set to end in 2016 after a pipeline to Lake Huron's Karegnondi Water Authority is finished.

A petition lobbying for the ending the city's Flint River water supply garnered 26,000 signatures.

Through continued demonstrations by Flint residents and mounting scientific evidence of the water's toxins, city and state officials offered various solutions — from asking residents to boil their water to providing them with water filters — in an attempt to work around the need to reconnect to the Detroit system.

That call was finally made by Gov. Rick Snyder (R) on Oct. 8. He announced that he had a plan for coming up with the $12 million to switch Flint back to the Detroit system. On Oct. 16, water started flowing again from Detroit to Flint.

This, too, was accompanied by the sense that it had come too late, particularly for the parents of children who may have been permanently affected.

These parents and other Flint residents filed a class-action federal lawsuit against Snyder, the state, the city and 13 other public officials in November for the damages they have suffered as a result of the lead-tainted water. The suit, which claims to represent “tens of thousands of residents,” alleges that the city and state officials “deliberately deprived” them of their 14th Amendment rights by replacing formerly safe drinking water with a cheaper alternative that was known to be highly toxic.

“For more than 18 months, state and local government officials ignored irrefutable evidence that the water pumped from the Flint River exposed [residents] to extreme toxicity,” the complaint reads. “The deliberately false denials about the safety of the Flint River water was as deadly as it was arrogant.”

Calling officials’ conduct “so egregious and so outrageous that it shocks the conscience,” the complaint cites the specific experiences of a few plaintiffs and their families, all of whom allege they have been challenged by similar health ailments since high levels of lead and copper entered their bloodstreams.

These conditions include skin lesions, hair loss, chemical-induced hypertension, vision loss and depression. Of the four families described in the complaint, two had ceased to drink Flint water after a certain point — and used it only for washing and cooking — but still said they were exposed to many of the same ill effects.

As the Detroit Free Press reported in October, avoiding Flint water became a way of life for the city’s residents.

Those who could afford it opted for bottled water, buying it by the gallons. Those who couldn't spare the money drank it straight from the tap all the same, knowing that they would be paying for it later. When it came to bathing, some slowly filled bathtubs with pots of boiled water for their children.

LeeAnn Walters, a Flint resident and mother of 4-year-old twins, took every precaution after blood tests revealed that the level of lead in one of her sons had soared after the switch to Flint River.

“I was hysterical,” Walters told the Free Press. “I cried when they gave me my first lead report.”

She had feared lead was the problem when her whole family developed rashes and her son stopped gaining weight.

Now, Walters said, when her children experience problems as they grow up, she will always wonder whether things would have been different — if their lives would have been better — if it weren't for the water.

Mayor Karen Weaver declares water crisis state of emergency in Flint

By Ron Fonger | rfonger1@mlive.com The Flint Journal on December 14, 2015 at 9:37 PM, updated December 15, 2015 at 7:39 AM

FLINT, MI -- Mayor Karen Weaver has declared a state of emergency in Flint, saying the city needs federal help to deal with its lead in water crisis.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told the City Council today, Dec. 14.

The new mayor asked that the Genesee County Board of Commissioners call a special meeting to take action to support her declaration, that it be forwarded to Gov. Rick Snyder, and potentially President Obama.

The end result of the resolution is not known, but Weaver said the city can't expect further help from the federal government without it.

"Do we meet the criteria (for a disaster area)? I don't know," Weaver said. "I'm going to ask and let them tell us no."

Flint is in a public health emergency, declared by Genesee County, because of rising levels of lead in water and in the blood of children after the city changed its water source to the Flint River from April 2014 until October.

The county declaration came after a Hurley Medical Center doctor's study showed the percentage of Flint infants and children with above-average lead levels nearly doubled citywide, and nearly tripled among children in "high risk" areas of lead exposure.

City officials have also said the use of corrosive Flint River water also damaged Flint's water infrastructure after state regulators never required the river water be treated to make it less corrosive.

Council members were divided in their opinion about what the declaration will mean.

"What this does is help position us as a community to show ... that we need resources in our community," said Councilman Scott Kincaid. "(It allows for us) to apply for state and federal funds. We have to prove ... that we need resources."

Councilman Josh Freeman said he doesn't want residents to expect immediate help with the city's water infrastructure, including lead service lines, because of the declaration.

"We need to find a way to actually fix the problem," Freeman said. "This declaration does not (fix the problem)."

Weaver's resolution says the damage done to Flint children because of lead exposure is irreversible, creating the need for increased spending on special education and mental health services and increased stress on the juvenile justice system.

---

http://michiganradio.org/post/mom-helped-uncover-what-was-really-going-flint-s-water

This mom helped uncover what was really going on with Flint's water (part one of the Michigan Radio documentary Not Safe to Drink)

Lindsey Smith, Michigan Radio • 17 hours ago

Up until October, the Walters family lived in a yellow two-story home on the south side of Flint. A couple of red maple trees shade the tiny front yard.

Walters heads to the back of the house, in a small room off of the kitchen, where the family keeps its stockpile of bottled water.

“This is our water stash. Once a week we go and we fill 40 gallons of water, so we have water to drink with, to cook with, and to bathe Gavin and Garrett in,” says Lee Anne Walters.

Walters won’t let her kids drink any water from her faucet. She won’t even let her four-year-old boys, Gavin and Garrett, bathe in anything but bottled water, so preparing for bath time is quite the chore.

Walters takes jugs of water she buys at the store, dumps them in large pots, and heats the water on her stove. Once it boils, she dumps the water in the bathtub. Then she adds three or four gallons of cool water to sort of get the bath at the right temperature.

Over several months, Walters says she’s gotten pretty efficient at this routine. She’s got bath prep down to about 45 minutes.

“And then in between, because we only do the bathing thing once a week now – because, one, it’s expensive, and two, the expense of all this on top of the water bills? We do baby wipe baths in between,” says Walters.

Walters scrubs the boys down with baby wipes almost every day. Luckily, her husband can shower at work. Her two oldest kids – they're teenagers – usually shower over at grandma’s house outside of town.

There’s a lot of people in Flint who knew something was wrong with the water, but this family’s story, particularly Walters' role as a worried mother, changed everything about how the water crisis in Flint was handled.

Something’s in the swimming pool

People in Flint started complaining about their tap water early in the summer of 2014 – not long after the city stopped pumping its drinking water from Detroit.

Instead, Flint started pumping it from the Flint River. Back then, Lee Anne Walters didn't think it was that big of a deal.

They had just bought their house. Someone had stripped all the plumbing from it, so they had to redo the house with new plumbing, and they installed a whole house filter.

Every drop of water that comes into her home goes through this filter.

But a few weeks after the city's switch to water from the Flint River, Walters noticed something was weird.

She had just set up the swimming pool in the side yard for the summer.

“Gavin started breaking out every time he'd get in the pool,” says Walters.

The rash was bad enough that Walters took him to the doctor.

“And the doctors kept telling us it was contact dermatitis.” She says they told her that “he's coming into contact with something that he's allergic to.”

Later, Walters says her doctors suggested it was eczema. They gave her a cortisone cream to rub on Gavin's rash, but by July 2014, it wasn't just Gavin. His twin brother Garrett got the rash too.

“And we took them in and they told us it was scabies, so we treated them with a pesticide,” says Walters.

Tiny mites cause scabies, and the common treatment is a chemical that’s also in some pesticides. It’s even in some mosquito nets and flea collars.

Walters rubbed the prescription cream on her twin boys from the neck down.

“I spent a ton of money because all the laundry that we had, all the bedding that we had, we took it to a laundromat,” she says.

Walters was relieved when the boys’ rash went away, but that feeling didn’t last long.

Walters remembers the day the rash came back, because she had a bunch of people over to celebrate her daughter’s high school graduation.

“And all the people that were here swimming and drinking the water, all of them broke out,” she says.

She scheduled another doctor's appointment for her four-year-olds. She got the same diagnosis, but Walters really had some doubts about the scabies diagnosis, especially after the party.

“The third time they tried to convince us that it was scabies, I said, ‘nun-uh, no.’ The cream wasn’t working on Gavin - period. He had that rash for more than a month straight.”

Walters wasn’t standing for it anymore, so she took Gavin to a dermatologist down in Brighton. They scraped in between Gavin’s little toes, and put it under the microscope.

“And she verified by doing the skin scrapes that there was no scabies. There was no live anything – no dead anything – no eggs, so no scabies,” she says.

She still didn’t know what caused the rash, but Walters noticed something. Gavin’s rash flared up every time he swam in the pool, and every time he took a bath.

Something clicked.

It became clear to her right then that Gavin’s rash was caused by something in the tap water.

The city of Flint learns about Walters' problem

Eight months after Flint started pumping its drinking water from the Flint River, Lee Anne Walters stopped letting her kids drink it – everyone from the four-year-old twins, Garrett and Gavin – to her teenagers, JD and Kaylie.

“We quit drinking the water in December, when my 14-year-old got sick and it started coming through our filter and out the kitchen sink brown,” she says.

That was December 2014.

Walters says the water had this orangeish-brown tinge that would not go away, even when she put a fresh cartridge in the water filter, and at this point she was putting a fresh cartridge in the water filter at least a couple times a month.

Back when Flint was buying Detroit water, she only replaced it a couple times a year, so she called the city out to come take a look.

The city sent Mike Glasgow, Flint's Utilities Administrator. He's a Flint native and he's spent the bulk of his career working for the city.

"I remember this fairly well," says Glasgow. "A complaint had come through from her about discolored water – orange water."

Glasgow says complaints like Walters' were common around this time, but there's a reason this one stood out.

"After the first day there, I said, 'well, there's a few ways we go about cleaning this up. We can flush hydrants. I'll have people from our service center get out and check the area – see if anything's out of the ordinary. I'll be back a week later as a follow-up and usually we can clear something up in that amount of time,'" he said.

A week later, Glasgow went back to Walters' house. Her tap water looked exactly the same. It still had this orange tinge.

"And I just happened to have some lead and copper sample bottles with me, and since her water was still discolored, I started to worry more about corrosion," he says.

People like Glasgow, those who help operate water plants in older cities like Flint, they worry about corrosion.

It can be a sign that a city isn't treating its water properly.

Water that's treated correctly – that has the right chemical balance – it will actually coat the inside of old pipes. That coating helps keep metals, like lead, copper, and iron from showing up in people's tap water.

An urgent voicemail. A mother's panic.

Glasgow ran a test on Walters' water.

"About a week later I got the results and it was pretty high for lead, so I called her right away to let her know," say Glasgow.

The results were alarming enough that Glasgow called Walters right away, but he couldn't reach her that afternoon.

He left her a voicemail.

Walters vividly remembers the message.

She recounted it for me:

"Hi Lee Anne, it's Mike from the Water Department. I just wanted to call and let you know we got your test back. Please, whatever you do, don't let your kids drink the water. Don't make their juice with it. And please just give me a phone call back as soon as possible."

Walters tossed and turned all night, worrying.

How bad could the water be?

By the time Walters did get ahold of Mike Glasgow the next day, she was kind of panicked.

“He's like, ‘your number's at 104,’ and I'm like, ‘OK, well what is it supposed to be?’ He's like, ‘not over 15.’ And I’m like, ‘wait, what?’”

I just want to make sure you really get these numbers they’re talking about. I mean, there’s no level of lead exposure that is considered safe, but any amount of lead in water above 15 parts per billion is a problem.

At that level, cities are supposed to at least warn you about how bad your lead levels are.

The lead level in the water at the Walters’ place was seven times higher than that.

But at that moment, hearing that number – 104 parts per billion – Walters remembers she didn’t know what to make of it.

“OK, what does this mean? He's like, ‘we don't know. We’ve never seen a number like this before in the city.’ He’s like, ‘it’s the highest anyone’s ever seen.’”

Glasgow was adamant no one drink the water. Don’t use it to cook with. Don’t brush your teeth with it. If you’re going to take a shower, wash dishes, or even do a load of laundry, let the water run for 10 or 15 minutes first.

Flushing beforehand helps lower lead levels, he said.

A week later, Glasgow came back to do a follow-up test.

“And that one came back at 397, and it was like, ‘whoa. OK. Well, here's an even higher number. What the hell?’ And then it was, ‘OK, well now you've got to start flushing your water for 25 minutes before you use it for anything,” says Glasgow.

After that test, Glasgow decided to keep a close eye on the water at the Walters’ place. He came out almost every week.

“And they were seeing it consistently brown every week,” says Walters. “They didn’t have any answers for me.”

You can see iron in water.

It’s what gave Walters’ tap water that awful orange tinge, but you can’t see the lead in water. It’s odorless, tasteless, and much more dangerous to your health.

With numbers like that, Lee Anne Walters did what probably any mother would do. She took her kids to the doctor to get tested for lead.

When the tests came back, the diagnosis wasn’t good for Gavin. The doctors said he had lead poisoning.

“After the fact, knowing I was giving this to my kids makes me sick, because we should be able to trust the fact that we’re paying for this service,” she says. “And we should be able to trust the fact that it’s not going to harm our kids.”

Tomorrow, in part two of our series, we'll hear how Lee Anne Walters contacts the EPA, and red flags start to go up. Mike Glasgow's fear about corrosion turns out to be well founded.

Flint Mayor Declares State of Emergency Over Water Problems

By THE ASSOCIATED PRESS

FLINT, Mich. — Dec 15, 2015, 7:54 AM ET

Flint's mayor has declared a state of emergency due to problems with the city's water system caused by using water from the Flint River, saying the city needs more federal help.

Karen Weaver announced the declaration Monday night and said the move intends to help raise awareness of continuing problems. She said damage to children caused by lead exposure is irreversible and that the city will need to spend more on special education and mental health services as a result.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told City Council.

Exposure to lead can cause behavior problems and learning disabilities in young children.

Genesee County earlier declared a public health emergency. Officials have told Flint residents not to drink unfiltered tap water.

Flint switched from Detroit's water system last year to Flint River water in a cost-cutting move while under state emergency financial management. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

But residents complained about the taste, smell and appearance of the water. Officials maintained the water met safety standards, but children were found to have elevated levels of lead in their blood and it was determined that corrosive river water was drawing lead from aging pipes.

Flint returned to Detroit's system in October.

Weaver was elected in November, unseating the incumbent mayor who led the city during the public health emergency and blamed state and federal agencies for the city's water problems. Weaver had promised while campaigning to issue an emergency declaration.

City Council members were divided about what the declaration will mean, The Flint Journal reported. Councilman Scott Kincaid said it's needed to seek more aid, noting that "We have to prove ... that we need resources."

Councilman Josh Freeman said he doesn't want residents to expect immediate help with the city's water infrastructure, including lead service lines, because of the declaration. He said the declaration doesn't fix the problem.

"We need to find a way to actually fix the problem," Freeman said.

FEMA sends 28,000 liters of bottled water to Flint amid lead troubles

By Ron Fonger | rfonger1@mlive.com on December 14, 2015 at 4:24 PM, updated December 14, 2015 at 8:50 PM

FLINT, MI — The federal government is helping to replenish the bottled water supply in Flint.

Two trucks delivered about 28,000 liters of water from the Federal Emergency Management Agency to the Food Bank of Eastern Michigan on Monday, Dec. 14. The water will be donated to "partner agencies" in the city of Flint that will distribute the water to residents.

"I don't think any (previous water donations) have been quite this large," said Kelly Belcher, marketing manager for the Food Bank.

Cassie Ringsdorf, a FEMA spokeswoman, said the agency maintains commodity stockpiles at warehouses across the country and makes them available.

"These commodities are available for use, within hours, should an incident occur that requires support from FEMA," Ringsdorf said in an email to The Flint Journal.

"As a part of our normal commodities management process, FEMA periodically offers commodities nearing the end of their shelf-life to eligible non-profits for donation. These donations are not done, 'on-request,' but are a part of our normal strategy to maintain our stockpiles for use in emergencies," the statement said.

A news release from the Food Bank credited Michigan State Police Lt. Billie Jo Roach with having identified the availability of the water from FEMA.

Flint remains in a public health emergency, and officials have said residents should not drink unfiltered tap water because of rising lead levels while the city used the Flint River as its water source from April 2014 until October 2015.

Earlier this month, Virginia Tech professor Marc Edwards said even though the city no longer uses the river as a water source, water remains unsafe to drink unfiltered in some areas of the city.

Roach is the MSP Emergency Management and Homeland Security Division District 3 coordinator.

The Journal could not immediately reach a representative of the MSP Emergency Management and Homeland Security Division for further comment.

FEMA said the Food Bank claimed two truckloads of water and agreed to pay all transportation costs associated with the donation.

Belcher said the United Way of Genesee County paid that expense for the Food Bank.

The Food Bank's partner agencies that will receive the FEMA water include soup kitchens, homeless shelters and food pantries, the organization said in its news release.

In Flint, Mich., there's so much lead in children's blood that a state of emergency is declared

By Yanan Wang December 15 at 4:31 AM

Flint, Mich., resident Gladyes Williamson cries out through her tears, overwhelmed with frustration over the water drawn from the Flint River. (Jake May /Flint Journal-MLive.com via AP)

For months, worried parents in Flint, Mich., arrived at their pediatricians' offices in droves. Holding a toddler by the hand or an infant in their arms, they all have the same question: Are their children being poisoned?

To find out, all it takes is a prick of the finger, a small letting of blood. If tests come back positive, the potentially severe consequences are far more difficult to discern.

That's how lead works. It leaves its mark quietly, with a virtually invisible trail. But years later, when a child shows signs of a learning disability or behavioral issues, lead's prior presence in the bloodstream suddenly becomes inescapable.

According to the World Health Organization, "lead affects children's brain development resulting in reduced intelligence quotient (IQ), behavioral changes such as shortening of attention span and increased antisocial behavior, and reduced educational attainment. Lead exposure also causes anemia, hypertension, renal impairment, immunotoxicity and toxicity to the reproductive organs. The neurological and behavioral effects of lead are believed to be irreversible."

The Hurley Medical Center, in Flint, released a study in September that confirmed what many Flint parents had feared for over a year: The proportion of infants and children with above-average levels of lead in their blood has nearly doubled since the city switched from the Detroit water system to using the Flint River as its water source, in 2014.

The crisis reached a nadir Monday night, when Flint Mayor Karen Weaver declared a state of emergency.

“The City of Flint has experienced a Manmade disaster,” Weaver said in a declaratory statement.

The mayor — elected after her predecessor, Dayne Walling, experienced fallout from his administration’s handling of the water problems — said in the statement that she was seeking support from the federal government to deal with the “irreversible” effects of lead exposure on the city’s children. Weaver thinks that these health consequences will lead to a greater need for special education and mental health services, as well as developments in the juvenile justice system.

“Do we meet the criteria [for a disaster area]? I don’t know,” she told Michigan Live. But Weaver doesn’t think the city can receive the help it needs without alerting federal officials to the urgency of the matter.

To those living in Flint, the announcement may feel as if it has been a long time coming.

Almost immediately after the city started drawing from the Flint River in April 2014, residents began complaining about the water, which they said was cloudy in appearance and emitted a foul odor.

Since then, complications from the water coming from the Flint River have only piled up. Although city and state officials initially denied that the water was unsafe, the state issued a notice informing Flint residents that their water contained unlawful levels of trihalomethanes, a chlorine byproduct linked to cancer and other diseases.

Protesters marched to City Hall in the fierce Michigan cold, calling for officials to reconnect Flint's water to the Detroit system. The use of the Flint River was supposed to be temporary, set to end in 2016 after a pipeline to Lake Huron's Karegnondi Water Authority is finished.

A petition lobbying for the ending the city's Flint River water supply garnered 26,000 signatures.

Through continued demonstrations by Flint residents and mounting scientific evidence of the water's toxins, city and state officials offered various solutions — from asking residents to boil their water to providing them with water filters — in an attempt to work around the need to reconnect to the Detroit system.

That call was finally made by Gov. Rick Snyder (R) on Oct. 8. He announced that he had a plan for coming up with the $12 million to switch Flint back to the Detroit system. On Oct. 16, water started flowing again from Detroit to Flint.

This, too, was accompanied by the sense that it had come too late, particularly for the parents of children who may have been permanently affected.

These parents and other Flint residents filed a class-action federal lawsuit against Snyder, the state, the city and 13 other public officials in November for the damages they have suffered as a result of the lead-tainted water. The suit, which claims to represent "tens of thousands of residents," alleges that the city and state officials "deliberately deprived" them of their 14th Amendment rights by replacing formerly safe drinking water with a cheaper alternative that was known to be highly toxic.

"For more than 18 months, state and local government officials ignored irrefutable evidence that the water pumped from the Flint River exposed [residents] to extreme toxicity," the complaint reads. "The deliberately false denials about the safety of the Flint River water was as deadly as it was arrogant."

Calling officials' conduct "so egregious and so outrageous that it shocks the conscience," the complaint cites the specific experiences of a few plaintiffs and their families, all of whom allege they have been challenged by similar health ailments since high levels of lead and copper entered their bloodstreams.

These conditions include skin lesions, hair loss, chemical-induced hypertension, vision loss and depression. Of the four families described in the complaint, two had ceased to drink Flint water after a certain point — and used it only for washing and cooking — but still said they were exposed to many of the same ill effects.

As the Detroit Free Press reported in October, avoiding Flint water became a way of life for the city's residents.

Those who could afford it opted for bottled water, buying it by the gallons. Those who couldn't spare the money drank it straight from the tap all the same, knowing that they would be paying for it later. When it came to bathing, some slowly filled bathtubs with pots of boiled water for their children.

LeeAnn Walters, a Flint resident and mother of 4-year-old twins, took every precaution after blood tests revealed that the level of lead in one of her sons had soared after the switch to Flint River.

"I was hysterical," Walters told the Free Press. "I cried when they gave me my first lead report."

She had feared lead was the problem when her whole family developed rashes and her son stopped gaining weight.

Now, Walters said, when her children experience problems as they grow up, she will always wonder whether things would have been different — if their lives would have been better — if it weren't for the water.

Mayor Karen Weaver declares water crisis state of emergency in Flint

By Ron Fonger | rfonger1@mlive.com The Flint Journal on December 14, 2015 at 9:37 PM, updated December 15, 2015 at 7:39 AM

FLINT, MI -- Mayor Karen Weaver has declared a state of emergency in Flint, saying the city needs federal help to deal with its lead in water crisis.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told the City Council today, Dec. 14.

The new mayor asked that the Genesee County Board of Commissioners call a special meeting to take action to support her declaration, that it be forwarded to Gov. Rick Snyder, and potentially President Obama.

The end result of the resolution is not known, but Weaver said the city can't expect further help from the federal government without it.

"Do we meet the criteria (for a disaster area)? I don't know," Weaver said. "I'm going to ask and let them tell us no."

Flint is in a public health emergency, declared by Genesee County, because of rising levels of lead in water and in the blood of children after the city changed its water source to the Flint River from April 2014 until October.

The county declaration came after a Hurley Medical Center doctor's study showed the percentage of Flint infants and children with above-average lead levels nearly doubled citywide, and nearly tripled among children in "high risk" areas of lead exposure.

City officials have also said the use of corrosive Flint River water also damaged Flint's water infrastructure after state regulators never required the river water be treated to make it less corrosive.

Council members were divided in their opinion about what the declaration will mean.

"What this does is help position us as a community to show ... that we need resources in our community," said Councilman Scott Kincaid. "(It allows for us) to apply for state and federal funds. We have to prove ... that we need resources."

Councilman Josh Freeman said he doesn't want residents to expect immediate help with the city's water infrastructure, including lead service lines, because of the declaration.

"We need to find a way to actually fix the problem," Freeman said. "This declaration does not (fix the problem)."

Weaver's resolution says the damage done to Flint children because of lead exposure is irreversible, creating the need for increased spending on special education and mental health services and increased stress on the juvenile justice system.

http://michiganradio.org/post/mom-helped-uncover-what-was-really-going-flint-s-water

This mom helped uncover what was really going on with Flint's water (part one of the Michigan Radio documentary Not Safe to Drink)

Lindsey Smith, Michigan Radio • 17 hours ago

Up until October, the Walters family lived in a yellow two-story home on the south side of Flint. A couple of red maple trees shade the tiny front yard.

Walters heads to the back of the house, in a small room off of the kitchen, where the family keeps its stockpile of bottled water.

"This is our water stash. Once a week we go and we fill 40 gallons of water, so we have water to drink with, to cook with, and to bathe Gavin and Garrett in," says Lee Anne Walters.

Walters won't let her kids drink any water from her faucet. She won't even let her four-year-old boys, Gavin and Garrett, bathe in anything but bottled water, so preparing for bath time is quite the chore.

Walters takes jugs of water she buys at the store, dumps them in large pots, and heats the water on her stove. Once it boils, she dumps the water in the bathtub. Then she adds three or four gallons of cool water to sort of get the bath at the right temperature.

Over several months, Walters says she's gotten pretty efficient at this routine. She's got bath prep down to about 45 minutes.

“And then in between, because we only do the bathing thing once a week now – because, one, it’s expensive, and two, the expense of all this on top of the water bills? We do baby wipe baths in between,” says Walters.

Walters scrubs the boys down with baby wipes almost every day. Luckily, her husband can shower at work. Her two oldest kids – they're teenagers – usually shower over at grandma’s house outside of town.

There’s a lot of people in Flint who knew something was wrong with the water, but this family’s story, particularly Walters' role as a worried mother, changed everything about how the water crisis in Flint was handled.

Something’s in the swimming pool

People in Flint started complaining about their tap water early in the summer of 2014 – not long after the city stopped pumping its drinking water from Detroit.

Instead, Flint started pumping it from the Flint River. Back then, Lee Anne Walters didn’t think it was that big of a deal.

They had just bought their house. Someone had stripped all the plumbing from it, so they had to redo the house with new plumbing, and they installed a whole house filter.

Every drop of water that comes into her home goes through this filter.

But a few weeks after the city’s switch to water from the Flint River, Walters noticed something was weird.

She had just set up the swimming pool in the side yard for the summer.

“Gavin started breaking out every time he’d get in the pool,” says Walters.

The rash was bad enough that Walters took him to the doctor.

“And the doctors kept telling us it was contact dermatitis.” She says they told her that “he’s coming into contact with something that he’s allergic to.”

Later, Walters says her doctors suggested it was eczema. They gave her a cortisone cream to rub on Gavin’s rash, but by July 2014, it wasn’t just Gavin. His twin brother Garrett got the rash too.

“And we took them in and they told us it was scabies, so we treated them with a pesticide,” says Walters.

Tiny mites cause scabies, and the common treatment is a chemical that’s also in some pesticides. It’s even in some mosquito nets and flea collars.

Walters rubbed the prescription cream on her twin boys from the neck down.

“I spent a ton of money because all the laundry that we had, all the bedding that we had, we took it to a laundromat,” she says.

Walters was relieved when the boys’ rash went away, but that feeling didn’t last long.

Walters remembers the day the rash came back, because she had a bunch of people over to celebrate her daughter's high school graduation.

"And all the people that were here swimming and drinking the water, all of them broke out," she says.

She scheduled another doctor's appointment for her four-year-olds. She got the same diagnosis, but Walters really had some doubts about the scabies diagnosis, especially after the party.

"The third time they tried to convince us that it was scabies, I said, 'nun-uh, no.' The cream wasn't working on Gavin - period. He had that rash for more than a month straight."

Walters wasn't standing for it anymore, so she took Gavin to a dermatologist down in Brighton. They scraped in between Gavin's little toes, and put it under the microscope.

"And she verified by doing the skin scrapes that there was no scabies. There was no live anything – no dead anything – no eggs, so no scabies," she says.

She still didn't know what caused the rash, but Walters noticed something. Gavin's rash flared up every time he swam in the pool, and every time he took a bath.

Something clicked.

It became clear to her right then that Gavin's rash was caused by something in the tap water.

The city of Flint learns about Walters' problem

Eight months after Flint started pumping its drinking water from the Flint River, Lee Anne Walters stopped letting her kids drink it – everyone from the four-year-old twins, Garrett and Gavin – to her teenagers, JD and Kaylie.

“We quit drinking the water in December, when my 14-year-old got sick and it started coming through our filter and out the kitchen sink brown,” she says.

That was December 2014.

Walters says the water had this orangeish-brown tinge that would not go away, even when she put a fresh cartridge in the water filter, and at this point she was putting a fresh cartridge in the water filter at least a couple times a month.

Back when Flint was buying Detroit water, she only replaced it a couple times a year, so she called the city out to come take a look.

The city sent Mike Glasgow, Flint’s Utilities Administrator. He’s a Flint native and he’s spent the bulk of his career working for the city.

“I remember this fairly well,” says Glasgow. “A complaint had come through from her about discolored water – orange water.”

Glasgow says complaints like Walters’ were common around this time, but there’s a reason this one stood out.

“After the first day there, I said, ‘well, there’s a few ways we go about cleaning this up. We can flush hydrants. I’ll have people from our service center get out and check the area – see if anything’s out of the ordinary. I’ll be back a week later as a follow-up and usually we can clear something up in that amount of time,’” he said.

A week later, Glasgow went back to Walters’ house. Her tap water looked exactly the same. It still had this orange tinge.

“And I just happened to have some lead and copper sample bottles with me, and since her water was still discolored, I started to worry more about corrosion,” he says.

People like Glasgow, those who help operate water plants in older cities like Flint, they worry about corrosion.

It can be a sign that a city isn’t treating its water properly.

Water that’s treated correctly – that has the right chemical balance – it will actually coat the inside of old pipes. That coating helps keep metals, like lead, copper, and iron from showing up in people’s tap water.

An urgent voicemail. A mother’s panic.

Glasgow ran a test on Walters’ water.

“About a week later I got the results and it was pretty high for lead, so I called her right away to let her know,” say Glasgow.

The results were alarming enough that Glasgow called Walters right away, but he couldn't reach her that afternoon.

He left her a voicemail.

Walters vividly remembers the message.

She recounted it for me:

"Hi Lee Anne, it's Mike from the Water Department. I just wanted to call and let you know we got your test back. Please, whatever you do, don't let your kids drink the water. Don't make their juice with it. And please just give me a phone call back as soon as possible."

Walters tossed and turned all night, worrying.

How bad could the water be?

By the time Walters did get ahold of Mike Glasgow the next day, she was kind of panicked.

"He's like, 'your number's at 104,' and I'm like, 'OK, well what is it supposed to be?' He's like, 'not over 15.' And I'm like, 'wait, what?'"

I just want to make sure you really get these numbers they're talking about. I mean, there's no level of lead exposure that is considered safe, but any amount of lead in water above 15 parts per billion is a problem.

At that level, cities are supposed to at least warn you about how bad your lead levels are.

The lead level in the water at the Walters' place was seven times higher than that.

But at that moment, hearing that number – 104 parts per billion – Walters remembers she didn't know what to make of it.

"OK, what does this mean? He's like, 'we don't know. We've never seen a number like this before in the city.' He's like, 'it's the highest anyone's ever seen.'"

Glasgow was adamant no one drink the water. Don't use it to cook with. Don't brush your teeth with it. If you're going to take a shower, wash dishes, or even do a load of laundry, let the water run for 10 or 15 minutes first.

Flushing beforehand helps lower lead levels, he said.

A week later, Glasgow came back to do a follow-up test.

"And that one came back at 397, and it was like, 'whoa. OK. Well, here's an even higher number. What the hell?' And then it was, 'OK, well now you've got to start flushing your water for 25 minutes before you use it for anything," says Glasgow.

After that test, Glasgow decided to keep a close eye on the water at the Walters' place. He came out almost every week.

"And they were seeing it consistently brown every week," says Walters. "They didn't have any answers for me."

You can see iron in water.

It's what gave Walters' tap water that awful orange tinge, but you can't see the lead in water. It's odorless, tasteless, and much more dangerous to your health.

With numbers like that, Lee Anne Walters did what probably any mother would do. She took her kids to the doctor to get tested for lead.

When the tests came back, the diagnosis wasn't good for Gavin. The doctors said he had lead poisoning.

"After the fact, knowing I was giving this to my kids makes me sick, because we should be able to trust the fact that we're paying for this service," she says. "And we should be able to trust the fact that it's not going to harm our kids."

Tomorrow, in part two of our series, we'll hear how Lee Anne Walters contacts the EPA, and red flags start to go up. Mike Glasgow's fear about corrosion turns out to be well founded.

Flint Mayor Declares State of Emergency Over Water Problems

By THE ASSOCIATED PRESS

FLINT, Mich. — Dec 15, 2015, 7:54 AM ET

Flint's mayor has declared a state of emergency due to problems with the city's water system caused by using water from the Flint River, saying the city needs more federal help.

Karen Weaver announced the declaration Monday night and said the move intends to help raise awareness of continuing problems. She said damage to children caused by lead exposure is irreversible and that the city will need to spend more on special education and mental health services as a result.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told City Council.

Exposure to lead can cause behavior problems and learning disabilities in young children.

Genesee County earlier declared a public health emergency. Officials have told Flint residents not to drink unfiltered tap water.

Flint switched from Detroit's water system last year to Flint River water in a cost-cutting move while under state emergency financial management. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

But residents complained about the taste, smell and appearance of the water. Officials maintained the water met safety standards, but children were found to have elevated levels of lead in their blood and it was determined that corrosive river water was drawing lead from aging pipes.

Flint returned to Detroit's system in October.

Weaver was elected in November, unseating the incumbent mayor who led the city during the public health emergency and blamed state and federal agencies for the city's water problems. Weaver had promised while campaigning to issue an emergency declaration.

City Council members were divided about what the declaration will mean, The Flint Journal reported. Councilman Scott Kincaid said it's needed to seek more aid, noting that "We have to prove ... that we need resources."

Councilman Josh Freeman said he doesn't want residents to expect immediate help with the city's water infrastructure, including lead service lines, because of the declaration. He said the declaration doesn't fix the problem.

"We need to find a way to actually fix the problem," Freeman said.

FEMA sends 28,000 liters of bottled water to Flint amid lead troubles

By Ron Fonger | rfonger1@mlive.com on December 14, 2015 at 4:24 PM, updated December 14, 2015 at 8:50 PM

FLINT, MI — The federal government is helping to replenish the bottled water supply in Flint.

Two trucks delivered about 28,000 liters of water from the Federal Emergency Management Agency to the Food Bank of Eastern Michigan on Monday, Dec. 14. The water will be donated to "partner agencies" in the city of Flint that will distribute the water to residents.

"I don't think any (previous water donations) have been quite this large," said Kelly Belcher, marketing manager for the Food Bank.

Cassie Ringsdorf, a FEMA spokeswoman, said the agency maintains commodity stockpiles at warehouses across the country and makes them available.

"These commodities are available for use, within hours, should an incident occur that requires support from FEMA," Ringsdorf said in an email to The Flint Journal.

"As a part of our normal commodities management process, FEMA periodically offers commodities nearing the end of their shelf-life to eligible non-profits for donation. These donations are not done, 'on-request,' but are a part of our normal strategy to maintain our stockpiles for use in emergencies," the statement said.

A news release from the Food Bank credited Michigan State Police Lt. Billie Jo Roach with having identified the availability of the water from FEMA.

Flint remains in a public health emergency, and officials have said residents should not drink unfiltered tap water because of rising lead levels while the city used the Flint River as its water source from April 2014 until October 2015.

Earlier this month, Virginia Tech professor Marc Edwards said even though the city no longer uses the river as a water source, water remains unsafe to drink unfiltered in some areas of the city.

Roach is the MSP Emergency Management and Homeland Security Division District 3 coordinator.

The Journal could not immediately reach a representative of the MSP Emergency Management and Homeland Security Division for further comment.

FEMA said the Food Bank claimed two truckloads of water and agreed to pay all transportation costs associated with the donation.

Belcher said the United Way of Genesee County paid that expense for the Food Bank.

The Food Bank's partner agencies that will receive the FEMA water include soup kitchens, homeless shelters and food pantries, the organization said in its news release.

EPA says it won't take quick action on petition targeting Flint water safety

By Ron Fonger | rfonger1@mlive.com The Flint Journal
on December 11, 2015 at 6:05 PM, updated December 11, 2015 at 6:07 PM

FLINT, MI -- The U.S. Environmental Protection Agency won't act immediately on a petition that seeks to involve it more deeply in Flint's water crisis.

EPA Regional Administrator Susan Hedman told the Natural Resources Defense Council in a Dec. 10 letter that regulators will wait to act on the request "until such time as the agency determines that corrosion control treatment is fully optimized for the Flint system."

The NRDC petition, filed on Oct.1 on behalf of several organizations, urges EPA to order Flint to reconnect to the Detroit water system and to require other actions necessary to protect the health of city residents.

Since the filing of the filing of the petition, there have been several developments involving Flint water, including reconnection to Detroit water

and more widespread testing for lead.

"In light of the actions that the state and the city have taken during the past several weeks, EPA could arguably conclude that your petition fails to meet the jurisdictional prerequisites set forth in ... the Safe Drinking Water Act," Hedman's letter says.

Anjali Waikar, staff attorney for the NRDC, said a public health emergency remains in Flint and EPA "hasn't done enough to ensure safe drinking water."

Despite a reconnection to the Detroit water system, a public health emergency remains in place in Flint as the city attempts to rebuild a protective mineral coating in water transmission lines during the next few months.

From April 2014 until October, the city used the Flint River as its source of water but was not required to treat it to make less corrosive, causing lead to increasingly leach into the water supply.

Earlier this week, the city announced it has begun boosting the amount of phosphate to the Detroit water it is receiving in an effort to better control corrosion and rebuild mineral scale that keeps lead from leaching as quickly.

Thanks very much.

One additional item I'd like to add to the briefing on Tuesday: a summary of the results from lead testing that has been done by the State and City – both tap water lead levels and blood lead levels. Also, anything we have heard about the testing being done by Hurley Medical Center.

Mike,

Thanks so much for all the documents you sent. I had seen the "City of Flint Water Supply Assessment, February 2013" previously. When I looked at it today, I found that the document I was looking for was listed on page 6 which is the "Analysis of the Flint River as a Permanent Water Supply for the City of Flint, 2011." After some Googling and subscribing to SCRIBD.com, I found the attached documents which are the report and its appendices. Neither document considers corrosion control treatment as a parameter to be addressed, although a cost estimate for phosphate addition is included in Appendix 8. I'm not sure if Flint followed any of the recommendations in this report before switching sources. What I have found interesting is that the "City of Flint Water Supply Assessment, February 2013", which was conducted by the Michigan State Treasurer's Office, recommended that Flint continue buying water from Detroit, but the State Emergency Manager(s) allowed Flint to contract with the Karegnondi Water Authority. Politics anyone?

Subject: RE: Flint River Study

Hi, George;

This is all that I have, and I don't think there ever was a competent, technical study done to focus on the corrosion control impacts. These studies were aimed at water quantity aspects, except the one that looked at THMs. I am thinking that the 2013 Water Supply Assessment document attached may be the study referenced on the flintwaterstudy.org web site. The study was commissioned in 2011 but finished in 2013. No mention of corrosion control for lead, though.

The mistake made to go from Detroit to Flint River water was predictable with the knowledge of even 30-35 years ago. You can't put a water with a pH of 7.5 or so into a system full of lead pipes. End of story. And certainly not put it into brass and soldered copper with a boatload of chloride, on top of the low pH. The central problem is that the LCR framework cannot currently prevent the implementation of knowingly incompetent, stupid technical decisions. States are generally powerless to stop it, even if they know better. And sometimes they either don't know better, or don't care. This situation was both. State guidance is to pre-flush for 3-4 minutes before LCR sampling stagnation (Flint instructions said 5 minutes), 6-8 hours standing with no use from that faucet, then add it to many houses having plastic interior plumbing because either old galvanized pipe failed or copper was stolen during vacant periods. Additionally, there was no verification that sites sampled actually met the targeting criteria of the LCR. This is a clinic on LCR flaws.

The consultants, DEQ and Flint apparently all thought that "lime softening" was sufficient for corrosion control, though they did not take into account that using recarbonation to lower the pH by a couple of units undid any benefit. Plus, quick calculations Darren did from monthly operating data suggested wild swings in pH (though always too low) and carbonate concentration, so that whole process was out of control.

The Veolia report reflects a scary lack of concern about the lead. They suggested saving lime and reducing softening, but focused on TTHMs and the aesthetic aspect of discolored water from iron corrosion and main breaks. Their suggestion was POLYPHOSPHATE addition as a partial solution, absolutely the worst thing they could do for lead on top of the low pH.

Subject: Flint River Study

Miguel,

I've been following the Flint lead issue mainly by checking the flintwaterstudy.org web site. In one of the articles posted there that I read last week, which I can't find now, it was mentioned that the City of Flint in 2011 had a contractor prepare a report on what would be needed if they began to use the flint River as a permanent source. It was further stated that the City submitted this report to the Michigan DEQ sometime in 2013. However, it appears that the DEQ did not consider the report when they allowed Flint to switch sources. I'm wondering if you have seen this 2011 report, and if so, could you send me a copy. I'm really curious about the report's recommendations, as a source switch like Flint's is probably a rare occurrence. I think that we might want to clarify what may be needed to approved a source change as part of the LCRLTR and/or LCR guidance. The 2011 report might be helpful in considering what might be needed in the LCR and its guidance.

I know that you're on the Flint work group so there's no rush to send me the report if you have access to it. Thanks.

8. Cost of Service Study – Flint Water Treatment Plant

I. Purpose

This study evaluates the feasibility of utilizing the City of Flint's Water Treatment Plant (WTP) and Flint River as the primary water supply for the City of Flint. The study evaluates whether the Flint River is an adequate source of water for the City of Flint and identifies upgrades needed to reliably supply water on a continuous basis.

II. History

The City of Flint's WTP was constructed in 1917 and supplied water to city customers for drinking and industrial uses. Records indicate that Flint supplied approximately 16 mgd in 1940 and that by the mid-1950s water use had increased to about 45 mgd. This significant increase coincided with increases in automobile production and population in the area. The Holloway Reservoir was constructed in 1954 to increase water supply capacity to meet the growing demand. Because of continued concerns regarding the adequacy of the Flint River for meeting the future water supply needs of the area, the city evaluated alternatives for a new water supply and ultimately contracted with the City of Detroit in 1967 for water supply. Detroit continues to supply water to Flint and its customers today. Detroit supplies finished water to the city via a single transmission pipeline. For reliability, the city's WTP has been maintained as a backup water supply in the event of a disruption to the single supply pipeline.

Because of recent concerns with the cost and reliability of the existing water supplies, the City of Flint, Genesee County, Lapeer County, the City of Lapeer, and Sanilac County are evaluating alternatives for their long-term water supply. The most recent study (Preliminary Engineering Report, Lake Huron Supply, Karegnondi Water Authority; September 2009) focused on two primary alternatives: Alternative 1 – continued supply by Detroit, and Alternative 2 – development of a new Lake Huron water supply. This study evaluates a third alternative. Alternative 3 provides for utilizing the existing City of Flint WTP to treat water from the Flint River. Alternative 3 assumes that water will be supplied only to customers within the city.

To evaluate the feasibility of Alternative 3, the river and WTP will be examined to determine their ability to supply water in sufficient quantity meeting current and anticipated regulations. There have been many new rules and regulations for treatment of surface water since 1967 when Flint's WTP was last used as a primary water supply.

III. Regulatory Requirements for Quantity of Source Water

Regulations require that the quantity of water at the source shall:

- Be adequate to meet the maximum projected water demand of the service area as shown by calculations based on a one in fifty year drought or the extreme drought of record, and should include consideration of multiple year droughts. Requirements for flows downstream of the intake shall comply with requirements of the appropriate reviewing authority.
- Provide reasonable surplus for anticipated growth.
- Be adequate to compensate for all losses such as silting, evaporation, seepage, etc.
- Be adequate to provide ample water for other legal users of the source.

IV. Demands

The alternative of utilizing the city's WTP and Flint River as a water supply will be evaluated on the basis of supplying water to Flint's direct customers only. Although Flint currently supplies water to GCDC-WWS, for this analysis it is assumed that GCDC-WWS receives its primary water supply by another source. Table 1 summarizes the city's current and projected demands for direct customers of the city. Projections have been provided by city representatives.

Table 1: City Customer Demand Summary

	2010	2035
Average Day Demand (ADD)	14.0 mgd	15.0 mgd
Maximum Day Demand (MDD)	17.5 mgd	18.0 mgd

Actual water requirements will be greater than the amount of water provided to customers. About ten percent additional water must be added for treatment processes and system operation. Water for fire-fighting is not included in customer demands and must be added to the quantity of water needed.

Surface water sources must be adequate to supply water through a drought period. Although the MDD is projected to be 18 mgd, the sustained maximum demand over a longer period will be less than the MDD. Analysis of records of water use indicates that the 30-day sustained maximum demand is about 80% of the MDD. Table 2 summarizes the source water requirements to supply the city's future needs.

Table 2: Source Water Requirements

Future Maximum Day Demand (Customers)		18.0 mgd
Future Maximum Day Demand (WTP Backwash / Process Water)		2.0 mgd
Subtotal (Future Maximum Day Demand)		20.0 mgd
Sustained (30 day) Future Maximum Day Demand	(80% of MDD)	16.0 mgd
Replenish Water from Fire Fighting		0.7 mgd
Future Maximum Day Demand (Source Water)		16.7 mgd

V. Drought Flows

USGS records indicate that the most severe drought in Michigan occurred between 1930 and 1937, and that the low stream flows experienced during this period have a recurrence interval of 50 to 70 years. River flow records which include the drought of the 1930s will be used to evaluate the adequacy of the river as a permanent water source.

VI. Reservoir Losses

Both the Holloway Dam and Mott Dam were constructed since the drought period of the 1930s. If used to simulate the "design drought conditions", the records of flow on the Flint River from the 1930's should be adjusted for potential impact from the addition of these two dams and resulting reservoirs.

A. Evaporation

If the two reservoirs had existed during the drought period, the flows in the river would have been a little less because of the volume of water which would have been lost to evaporation from these two bodies of water.

B. Sedimentation

The July 2001 Flint River Assessment completed by the MDNR indicates that sedimentation occurs in the Holloway Reservoir at an accelerated rate, but does not provide specific volumes. Sedimentation reduces the storage volume of reservoirs. No investigation to determine the amount of sedimentation has been completed in the Holloway Reservoir since its construction, but the storage volume of the reservoir has certainly decreased since its construction.

Mott Dam maintains a fixed water level, so storage for water supply is not available. Therefore, sedimentation in Mott Lake is not a concern with respect to water supply.

C. Seepage

The land adjacent to both the Holloway Reservoir and Mott Lake has a relatively high groundwater table. Any loss of water by seepage from the bottom of the reservoirs seems likely to flow back to the river downstream of the respective dams, resulting in little or no impact to the quantity of water available for water supply or flow augmentation. Loss from the reservoirs by seepage is not considered a significant factor.

VII. Other Water Uses

Since 1967 when Detroit began supplying water to Flint, the Holloway Reservoir has been utilized as a backup water source, source of flow augmentation for the river, and for recreational purposes. Although the city maintains control over the dam and water levels; the city has leased their surrounding lands to the Genesee County Parks and Recreation Commission (GCPRC) for park, recreational, and conservation purposes. In 1987, the city and GCPRC adopted the Holloway Reservoir Management Plan (HRMP) which defined how water levels in the reservoir were to be maintained to achieve the goals above. The HRMP establishes a summer water level of 755 and a winter level of 751. Discharge from the reservoir is to be maintained above 65 cfs except when the level is less than 751; outflow from the reservoir is not to exceed inflow to the reservoir. A copy of the HRMP is included in Appendix 1.

Flow augmentation for the city's WWTP discharge is another consideration. The city's NPDES permit for their WWTP indicates that a Flint River drought flow of 85 cfs was used to determine the permitted limits for WWTP effluent. It appears that the HRMP requirement to maintain a 65 cfs minimum at the Holloway Reservoir was established to provide adequate flow in the river at the city's WWTP outfall. An excerpt of the city's WWTP NPDES permit is included Appendix 2.

The existing water supply contract between the city and Genesee County Drain Commissioner Division of Water and Waste Services (GCDC-WWS) provides that both the city and GCDC-WWS supply the other up to 8 mgd of finished water in the event of an emergency or supply disruption. For this analysis, it is assumed that the Flint WTP and river must be able to supply 8 mgd to GCDC-

WWS in the event of an emergency in addition to the quantity consumed by the city's water customers. The need to provide backup to GCDC-WWS is assumed to be limited to a period of two weeks. Over a 14 day period, 125 million gallons of water should be reserved to meet the commitment for an emergency supply.

VIII. Analysis of Adequacy of Flint River

A detailed analysis of the adequacy of the Flint River as a water supply source is included in Appendix 3. This section provides an overview.

In 1977 when the HRMP was executed, water was not withdrawn from the Flint River for water supply. In 1977 without any withdrawal for water supply, the HRMP provided for a minimum discharge of 65 cfs from the Holloway Reservoir, to provide for a river flow of 85 cfs at the city's WWTP. If water is withdrawn from the river for water supply, the minimum flow from the reservoir must be increased by the rate of WTP withdrawal if the 85 cfs base flow is to be maintained at the city's WWTP. With Flint's future sustained demand estimated to be 16.7 mgd (26 cfs), a minimum flow of 91 cfs (65 cfs + 26 cfs) will be needed from the Holloway Reservoir to maintain the 85 cfs base flow at the WWTP.

The United States Geological Survey (USGS) in a 1963 report Water Resources of the Flint Area Michigan examined the Flint River as a water supply for Flint. Using river flow records between 1930 and 1952, the USGS report includes a Draft-Storage curve for the Holloway Reservoir. If a minimum discharge of 91 cfs is to be maintained during a drought period, 6.2 billion gallons water would need to be withdrawn from the reservoir to supplement natural river flow.

In addition to the 6.2 billion gallons of storage to maintain the existing rates of flow in the river plus water supply, additional storage is required to provide GCDC-WWS an emergency supply and to make up for reservoir losses. The following table summarizes the total storage needed.

Table 3: Storage Requirements

Storage to meet sustained demand and WWTP flow	6.20	billion gallons
Storage to provide backup supply to GCDC-WWS	0.11	billion gallons
Storage to make up loss by evaporation	0.90	billion gallons
Storage lost by siltation	0.64	billion gallons (assumed)
Storage to provide loss by seepage	0.00	billion gallons
Storage Needed to Supplement River Flow	7.85	billion gallons

To provide 7.85 billion gallons of storage, the Holloway Reservoir operating level must be raised by at least three feet to 758 feet. Although possible, there are many challenges associated with operating the Holloway Reservoir at the 758 feet level.

- The existing drum gates used to control reservoir level are designed for adjustment over a four feet range (751 feet to 755 feet). The design of the dam is such that the existing gates cannot simply be replaced with larger ones to increase the upper level to 758 feet. The dam spillway will likely need to be reworked to accommodate the larger drum gates. Drawings showing the details of the dam are included in Appendix 4.

- Although operation at the 758 water level provides five feet of freeboard to the top of the dam, the watershed contributing to the reservoir is quite large and has resulted in quick increases in the reservoir level during extreme rain events. The reduction in freeboard will result in a reduced safety factor for managing flood events.
- Seepage through the earthen dam embankment will increase as a result of the increased hydraulic pressure with the higher water level. Increased seepage through the dam's embankment will reduce the strength and integrity of the embankment and is likely to increase maintenance needs.
- The 758 feet water level is based on an assumption regarding the loss of the reservoir volume by siltation. The depth of siltation should be measured to better determine the quantity of siltation and its impact on storage and reservoir level.
- Recreational activities, the fishery, and adjacent properties will be impacted by use of the reservoir for water supply. Normal water levels will be increased by three feet and during dry periods, the water levels may vary by several feet. During an extreme drought period, water levels may be as much as 11 feet below normal levels.
- If the 85 cfs drought flow at the city's WWTP cannot be achieved, a new NPDES permit with stricter discharge limits may issued by the MDEQ. This could result in higher WWTP costs for the city.

Analysis shows that without modification, the Holloway Reservoir can support a sustained maximum day demand of 11.6 mgd for water supply through a drought period.

IX. Dams

If the Flint River is to be used as water supply, existing dams will continue to be critical for management of the flows in the river and water supply. Following is a summary of the dams on and adjacent to the river.

Table 4: Summary of Dams

Facility	Construction Completed	Catchment Area (sq. mi.)	Surface Area (Acres)	Storage (Acre-Feet)	Ownership	Hazard Classification	Condition
Holloway Dam	1954	523	1,973	17,678	Flint	High	Good
Mott Dam	1972	612	684	0	GCPRC		Good
Kearsley Dam	1929	115	175	2,000	Flint	Significant	Satisfactory
Utah Dam	1928	729		0	Flint	Low	Poor
Hamilton Dam		748	17		Flint	High	Poor
Thread Creek Dam	1973	63	80	320	Flint	Significant	Poor

A. Holloway Dam

The Holloway Dam was last inspected in 2008 and was reported to be in good condition. A copy of the 2008 Dam Safety Report is included in Appendix 5. Other than routine maintenance, the following upgrades / modifications are recommended to provide a water supply of up to 11.6 mgd:

- Replacement of drum gate bearings
- Installation of river flow gage on North Branch of Flint River
- Improved instrumentation to measure and monitor gate positions and water surface level

If the river is to be used as a water supply of greater capacity than 11.6 mgd, additional modifications are required at the Holloway Dam to allow for operation at an increased water level. These improvements will include replacement of gates with larger ones and reworking of the dam spillway to accommodate the larger gates. The existing embankment should be armored to strengthen the dam's embankment and protect against erosion from wave action. A budget of $2.57 million is established for the upgrades to the Holloway Dam to provide adequate capacity for the projected future demands.

B. Mott Dam

The Mott Dam is under the jurisdiction of the GCPRC. The reservoir level is maintained by a fixed weir so the reservoir volume is not available for storage. The dam has been reported to be in good condition.

C. Utah Dam

Utah Dam is inoperable and in poor condition. A copy of the 2008 Dam Safety Report is included in Appendix 6. Recent studies and evaluations conclude that the dam is of little benefit and should be removed. The 2010 Hamilton Dam Modifications and Riverfront Restoration PER provides a budget of $1.9 M for removal of the Utah Dam, including replacement with a pedestrian bridge, construction of a boat launch, and local storm sewer upgrades.

D. Hamilton Dam

The Hamilton Dam is in poor condition and considered unstable. A copy of the 2008 Dam Safety Report is provided in Appendix 7. The dam has been the subject of extensive study and recommended for removal and replacement. The 2010 Hamilton Dam Modifications and Riverfront Restoration PER provides a budget of $7.1 M for the removal and replacement of the dam, including ancillary upgrades to adjacent portions of the river.

The new Hamilton Dam is proposed at a lower elevation than the existing dam to reduce potential for flooding. A reduced water level upstream of the dam will reduce the water pool depth at the WTP intake, unless the Utah Dam is replaced or another dam is added. Testing of pumps at the WTP was completed to determine the impact of a reduced water depth at the WTP intake. Allowing for two feet of loss through the WTP intake screens after operation, reduction of the height of the Hamilton Dam by 1.5 feet or more will impact WTP's ability to draw water from the river.

E. Kearsley Dam

The Kearsley Dam is reported in satisfactory condition. Although the dam is located downstream of the city's WTP, water from the dam and Kearsley Lake supplements the river flow in advance of the Hamilton Dam, therefore contributing to the impoundment from which the WTP draws water. Water from the Kearsley Creek also serves to augment river flow at the city's WWTP located further downstream.

The storage volume of Kearsley Lake is relatively minor in relation to the storage deficit from Section VIII. Supplemental flows to the river from the Kearsley Creek are included in the USGS records included in this analysis

The dam is an important component of the city's water supply system because of its potential contribution to the WTP intake. Although currently in satisfactory condition, there will be ongoing maintenance needs to be addressed.

F. Thread Lake Dam

The Thread Lake Dam is reported to be in poor condition. Flow from the Thread Creek supplements the river flow prior to the city's WWTP. The storage provided by Thread Lake is negligible and flow from Thread Creek is included in the USGS records of river flow used for this analysis.

The Thread Lake Dam remains a facility of the city which because of its poor condition needs to be addressed. However, since the dam appears to be of little benefit to the water supply considered in this analysis, a budget for upgrades or removal has not been included in the costs for water supply.

X. Source Water Quality

Since the Flint WTP is the backup water supply in the event of a disruption to the supply from Detroit, raw water at the WTP intake is regularly sampled and analyzed. Available records provide a good understanding of the characteristics of the raw water and ranges of variances, and will be helpful to design water treatment processes and estimate operating costs.

Preliminary analysis indicates that water from the river can be treated to meet current regulations; however, additional treatment will be required than for Lake Huron water. This results in higher operating costs than the alternative of a new Lake Huron supply.

Although water from the river can be treated to meet regulatory requirements, aesthetics of the finished water will be different than that from Lake Huron. As an example, the temperature of water supplied to customers during the summer will be warmer than the present Lake Huron supply, because of the increased summer temperature in the relatively shallow river.

A detailed investigation of potential sources of contamination has not been completed. The MDEQ has reported that the Richfield Landfill is considering an application for an NPDES permit to allow for discharge of stormwater and/or treated leachate to the Holloway Reservoir. If an NPDES permit is issued, there may be an impact on the quality of source water.

If used for water supply, a source water protection management plan should be developed to study the watershed, identify potential sources of contamination, and enact safeguards to prevent or control future threats.

XI. Water Treatment

For comparison with other alternatives, it is assumed that the Flint WTP will treat water from the river to provide a finished water of similar quality to the other alternatives being considered (continued Detroit supply and new Lake Huron supply).

A review of the city's WTP has been completed (Technical Memorandum, Cost of Service Study, Flint Water Treatment Plant prepared by Lockwood, Andrews, and Newnam (LAN), dated June 2011) to evaluate its ability to treat water from the river on a continuous basis to meet current and anticipated regulations and produce high quality finished water. Details regarding this review and analysis are provided in Appendix 8.

Although the WTP has been maintained and operated as a backup water supply, there have been numerous changes in regulations and standards since the WTP last supplied water on a continuous basis. Although equipment and systems at the WTP have been used sparingly, some existing equipment and systems require replacement from deterioration or obsolescence to provide reliability for continuous operation.

Following is a summary of upgrades needed.

A. Lime Sludge Disposal

Prior to supply of water by DWSD, the city's WTP disposed of lime sludge from water treatment operations at the Bray Road disposal site. The city is working with the MDEQ to address concerns at the Bray Road site; for this study it has been assumed that new sludge handling and disposal provisions will be utilized. Lime residual handling and disposal facilities have an estimated project cost of $15.1 million. No costs have been included for remediation of the Bray Road site.

B. Soda Ash Feed System

Records of analyses of the source water indicate non-carbonate hardness. To remove the non-carbonate hardness and provide softening, soda ash should be added during treatment. The addition of a soda ash feed system has an estimated project budget of $0.5 million.

C. Chemical Storage

Bulk chemical storage of at least 30 days is needed if the plant operates on a continuous basis. New storage tanks for liquid carbon dioxide, liquid oxygen, and liquid nitrogen will be needed. The project budget for chemical storage is $2.1 million.

D. Electrical and SCADA

The power requirements of equipment at the WTP exceed the capacity of the substation which supplies the plant. Backup power generators at the WTP are not currently operable. Upgrades are recommended to power feeders for several of the existing systems. New SCADA is recommended to provide control and monitoring of operations at the WTP. The project budget for these upgrades is $8.1 million.

E. Post Chlorination and Zebra Mussel Control

Zebra mussels are an invasive shell fish which have been introduced to the Great Lakes basin, including the Flint River. Zebra mussels can obstruct pipes and water intake screens. A sodium permanganate feed system is proposed for zebra mussel control. The project budget is $0.3 million.

F. Security Issues

Additional security measures to guard against malevolent threats or terrorism which target the new water source will be required. A project budget for this is $0.3 million.

G. Pumping System Improvements (Low and High Service Pumps in PS No. 4)

The pumps are in poor condition and their capacity is not consistent with the projected demands of the city. The pumps should be replaced with new, more efficient pumps. The project budget for these is $7.8 million.

H. Filter Transfer Station to Dort Reservoir and UV Inactivation

Recent USEPA regulations require additional treatment or enhancement of existing treatment processes for microbial contaminates such as giardia, cryptosporidium, viruses, and bacteria. It is anticipated that enhanced contact time and ultraviolet light deactivation will be required to comply with these new standards. A project budget of $7.0 million is established for compliance with the new surface water treatment rules.

I. Emergency Interconnect

The GCDC-WWS and City of Flint have a mutual aid agreement providing for each to provide the other up to 8 mgd of water as a back-up supply in the event of an emergency with either system's supply. A pumping station and piping interconnect is needed to effectively complete this exchange. The project budget for these upgrades is $8.6 million.

The total of all WTP upgrades above is $49.9 million.

In addition to upgrades to the treatment plant, there will be increased operating costs associated with the continuous operation of the WTP. For comparison with other alternatives for a long-term water supply, only the additional operational costs have been determined.

- Labor – Full scale operation of the WTP and dams on a continuous basis will require additional staffing. It is estimated that labor costs will increase by $2,034,000 per year.
- Chemicals – The cost of chemicals used for water treatment are estimated at $423 per million gallons of water produced.
- Residual Disposal – Disposal costs for lime sludge is estimated to be $453,000 annually.

- Power – Increased power costs are estimated to be $104 per million gallons of water produced.
- Ozone – Ozone treatment will be needed to meet new treatment standards. A budget of $208,000 is assumed.
- Maintenance – Maintenance costs are assumed to be 20% of the O&M budget. Maintenance costs of the WTP and other facilities are expected to be relatively high because of the age of the facilities.

XII. Cost Summary

Upgrades to dams and the WTP will be needed for the Flint River to reliably supply drinking water on a continuous basis to Flint's customers. The cost of these upgrades is presented in the following table. Costs have been adjusted to an ENR Construction Cost Index of 8688 to allow for comparison with the 2009 Study. It has been assumed that design/construction commenced in 2010, to allow for comparison with the alternatives in the 2009 study.

Table 5: Project Costs

WTP Upgrades	$49,888,000
Hamilton Dam Replacement	$7,100,000
Holloway Dam /Reservoir Upgrades	$2,570,000
Utah Dam Removal	$1,900,000
Total Capital Cost	**$61,458,000**

Costs shown are based on upgrades to existing facilities to supply the projected future maximum day demand of 18.0 mgd. These upgrades are based on the assumption that the HRMP is modified to allow for operation over a greater range of water levels. Other options for supplying the projected maximum day demand will result in higher costs.

Operating costs in the initial year of operation are estimated to increase $7 million above current operating costs. Operating costs are projected to increase annually because of inflation and projected growth in demand over the study period.

Figure 1 shows the cost of water for Alternative 3, utilizing the existing WTP and Flint River for water supply. The cost of water is comprised of three components: continued purchase of water from Detroit during construction, debt for construction of facility upgrades, and ongoing operating costs.

Figure 1: Cost of Water Using Flint River as Source

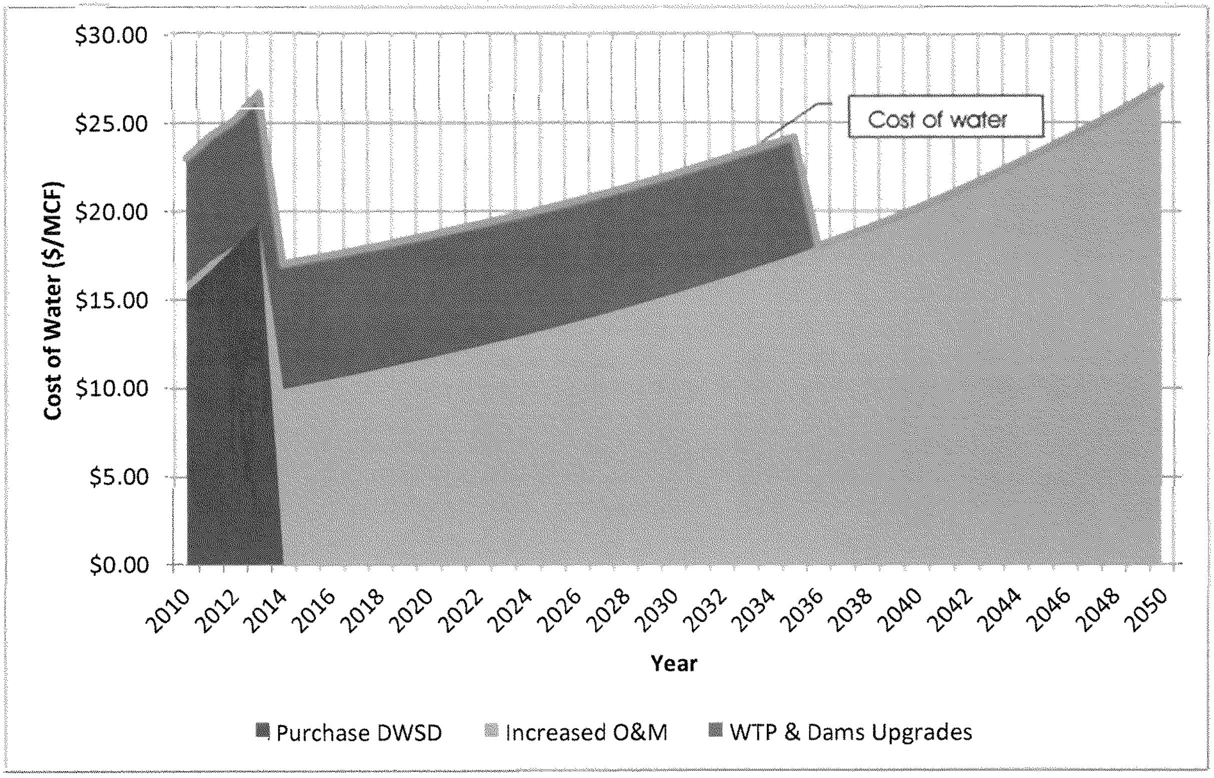

Figure 2 compares the cost of water for all three alternatives. Continued Supply by the City of Detroit results in a higher cost for water supply than the other two alternatives. The city's costs for The KWA-New Lake Huron Supply have been based upon the terms of the current KWA Raw Water Supply Contract, and the assumption that the city purchases 18 mgd capacity in the KWA system. The KWA alternative is projected to result in the lowest cost for water.

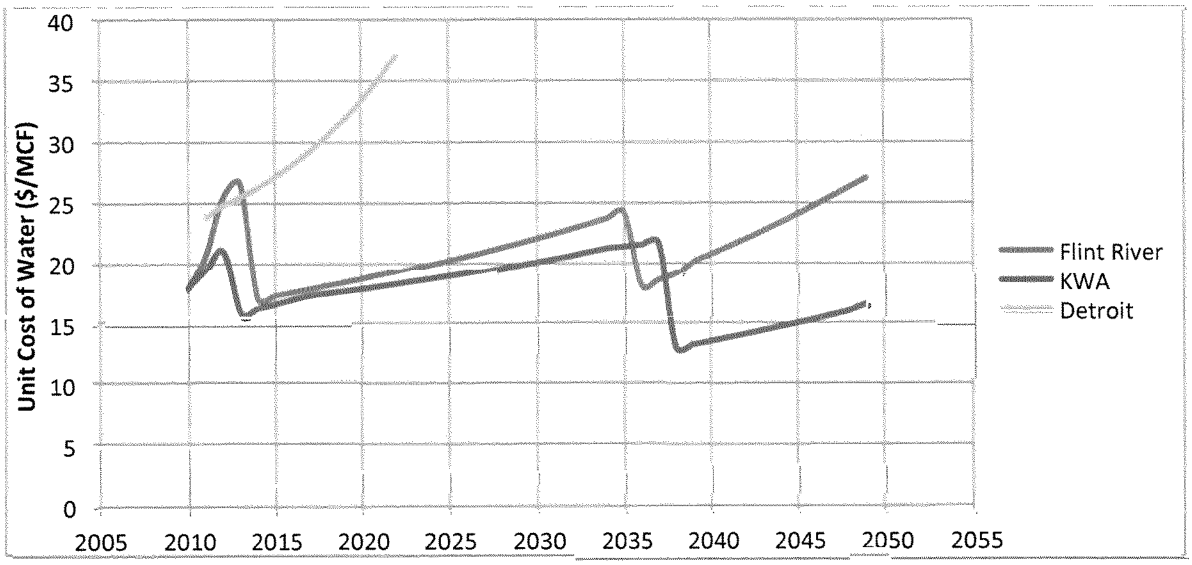
Figure 2: Comparison of Alternatives



XIII. Implementation

Planning, design, construction, and start-up will require 52 to 60 months for completion. Additional time may be required to address ancillary issues such as modifications to agreements, permits, and "non-construction related" environmental issues.

XIV. Intangibles

In addition to the upgrades identified for the dams and WTP, other issues will potentially need to be addressed if the Flint River is to be used as a water supply. Examples of these include:

- Environmental impact of work on dams or removal of sediment from the river or reservoirs
- Impact of construction and reservoir operation on the fishery
- Impact to recreational users and land owners adjacent to the Holloway Reservoir
- Potential upgrades to the city's WWTP if river flows are reduced and stricter effluent limits are included in future NPDES permits
- Impacts of the replacement of the Hamilton Dam at a lower level for improved flood control may impact the ability for the WTP to draw water from the river
- Results of a Source Water Protection Plan which may identify potential threats of contamination or other impacts to the water supply

XV. Summary

Analysis indicates that the cost of supplying water from the Flint River on a continuous basis will be greater than the proposed KWA Raw Water Supply Contract, but less than continued supplied from Detroit. Additionally, if the Flint River is to be used for a water supply for city customers, there will need to be some modifications to existing facilities, operating agreements, and permits. Upgrades will be required at the city's dams and the water treatment plant to reliably supply water to the city on a continuous basis. To meet the future maximum day demand of 18 mgd projected by city staff, one or more of the following will be required.

- Modify the Holloway Dam and Reservoir to provide additional storage
- Modify the HRMP to provide for more variance in water levels and/or modify limits on minimum discharge
- Modify the WWTP NPDES permit based on reduced flows in the river and provide resulting upgrades to WWTP for higher treatment
- Provide other raw water storage reservoirs

Addressing the preceding items is likely to require a great deal of time and effort because of the impacts on many other parties. Without making the modifications above, the river is limited to supplying a maximum day demand of about 11.6 mgd.

GENESEE COUNTY DRAIN COMMISSIONER

KENNETH J. SMITHEE
DIRECTOR

Please be advised that the recommendations as outlined on Attachment A were approved by the Genesee County Parks & Recreation Commission meeting in formal session on March 12, 1987.

On behalf of the Commission, I would like to extend our personal thanks to each of you for the assistance which you rendered which led to the agreement between the Parks & Recreation Commission and the City of Flint and will provide protection for recreational users of the Holloway Reservoir, adjacent property owners and also help protect the fish and other aquatic life.

Thanks again.

Sincerely,

Kenneth J. Smithee
Director

AGENDA ITEM: (5). i.

R-22

PRESENTED: 3/9/87

ADOPTED: 3/9/87

By the Mayor:

WHEREAS, the City of Flint in adopting ordinance 2208 granted to the Genesee County Parks and Recreation Commission the right to establish and operate park and recreational facilities and conservations programs on property owned by the City of Flint in the Holloway Reservoir area; reserving unto itself the power to control and regulate the dams and water levels of the Holloway Reservoir, and

WHEREAS, it is in the interests of the City and the Genesee County Parks and Recreation Commission to establish a Management Plan which optimizes the summer recreational programs available to the public while preserving downstream usages of the Flint River, and which will assist the City in implementing the provisions of ordinance 2208.

NOW, THEREFORE, BE IT RESOLVED, that the City of Flint adopts the attached Holloway Reservoir Management Plan.

APPROVED AS TO FORM:

Chief Legal Officer

R990

COUNCIL MARCH 9, 1987

HOLLOWAY RESERVOIR MANAGEMENT PLAN

GENERAL OBJECTIVE:

To operate Holloway Dam in a manner that optimizes summer recreation on the Holloway Reservoir while preserving downstream usages of the waters of the Flint River and assuring availability of a back-up water supply for Flint.

GENERAL OPERATING PROCEDURE:

Spring Fill - The City of Flint shall operate the dam with the intention of capturing a sufficient quantity of spring run-off to maintain the reservoir at a minimum elevation of 755 feet no later than May 1 of each year.

Summer Operation - The City of Flint shall maintain a minimum outflow of 65 cfs until the level of the reservoir falls to an elevation of 752.7 feet. At any time that the level reaches elevation 752.7 feet the city shall operate the dam such that the outflow does not exceed inflow, on any given day, provided, however, that the city shall not be obligated to make more than one adjustment to flow during any given day.

Winter Drawdown - The City of Flint shall operate the dam to gradually drawdown the reservoir during the first two weeks of November to an elevation of 751 feet in order to prevent structural damage to the dam from freezing.

Notification - The City of Flint shall provide prior notification to the Genesee County Parks and Recreation Commission before making a change in dam operations which result in significant drawdown.

Maintenance and Construction - Routine maintenance shall be scheduled to avoid conflicts with major events and peak usage periods on the reservoir. A minimum of 30 days notification shall precede all maintenance and construction involving significant drawdown. The Genesee County Parks and Recreation Commission shall promptly receive copies of all dam maintenance permit applications made by the City of Flint to the Michigan Department of Natural Resources.

Gauging of Water Flow into Reservoir - The City of Flint shall be a cooperator with the U.S.G.S. and State of Michigan to establish a stream gauge on the north branch of the Flint River upstream of the Holloway Reservoir and be a cooperator on the annual maintenance and operation of the existing gauge on the south branch of the Flint River and the new gauge on the north branch of the Flint River.

EMERGENCIES:

In emergency situations affecting public health, safety and welfare the City of Flint shall operate the Holloway dam in a manner to protect the public health, safety and welfare. This shall be done even though recreational users and others may be temporarily inconvenienced. Situations which shall be identified as emergencies shall include but not be limited to the following: flood conditions, interruption of the City of Flint's public water supply, and event(s) which threatens the structural integrity of the dam, and acts of God. However, low flow augmentation for sewage treatment shall not be considered as an emergency.

MONITORING:

The City of Flint in cooperation with the Genesee County Parks and Recreation Commission will assure conformance with the Holloway Reservoir Management Guidelines. A standing oversight committee shall be created to provide monitoring of the reservoir management and facilitate exchange of timely information regarding the Holloway dam and reservoir. The committee shall be composed of two members from both the City of Flint and the Genesee County Parks and Recreation Commission and shall meet in April and November of each year. The Genesee County Parks and Recreation Commission shall provide the City of Flint with a schedule for summer events on Holloway Reservoir at the April meeting of the Oversight Committee.

PERIOD AND EXECUTION OF AGREEMENT:

The Holloway Reservoir Management Plan shall be in full force and effect when officially adopted by the Flint City Council and the Genesee County Parks and Recreation Commission and shall remain so until altered by mutual agreement.

MANAGEMENT PLAN STATUS:

This management plan establishes targets for optimal operation of the Holloway Dam and Reservoir but does not replace the terms and conditions of Flint City Ordinance No. 2208.

p:DAM(a)

Appendix 2 - Excerpt of Flint WWTP NPDES permit

PART I

Section A. Limitations and Monitoring Requirements

1. Final Effluent Limitations, Monitoring Point 001A

During the period beginning on the effective date of this permit and lasting until the expiration date of this permit, the permittee is authorized to discharge treated municipal wastewater from Monitoring Point 001A through Outfall 001. Outfall 001 discharges to the Flint River. Such discharge shall be limited and monitored by the permittee as specified below.

The following design flow was used in determining the above limitations, but is not to be considered a limitation or actual capacity: A rated design capacity of 50 MGD and the 1988 Water Resources Commission directive to use a 95 percent exceedance (Flint River drought) flow of 85 cfs (Holloway Reservoir Management Plan) for limit calculations.

Appendix 3 - Analysis of Adequacy of Flint River as a Water Supply

Technical Memorandum
Analysis of Adequacy of Flint River as Water Supply

1.0 Quantity of Water Required

Recommended Standards for Water Works, 2003 Edition indicates that the quantity of surface water at the source shall:

- Be adequate to meet the maximum projected water demand of the service area as shown by calculations based on a one in fifty year drought or the extreme drought of record, and should include consideration of multiple year droughts. Requirements for flows downstream of the intake shall comply with requirements of the appropriate reviewing authority.
- Provide reasonable surplus for anticipated growth
- Be adequate to compensate for all losses such as silting, evaporation, seepage, etc.
- Be adequate to provide ample water for other legal users of the source.

2.0 Demand Summary

City staff has indicated the future maximum day demand of the city is 18 mgd.

In addition to the water used by customers, some water will be required for water treatment processes and filter backwash. An allowance for WTP Backwash and Process water of 2 mgd is assumed.

Water used for fire-fighting is not included in customer demand or sales. An allowance 0.7mgd for replenishing water used for fire-fighting is assumed.

The maximum day demand represents the quantity of water which must be supplied on the particular day that the highest use (demand) occurs. Treatment and pumping must be designed to deliver the maximum day demand. During peak periods, storage from the Holloway Reservoir can be utilized to supplement the natural river flow. For analysis of the river as a source, the maximum month will be used as the demand.

A review of the city's water demands and precipitation records suggest that maximum month demand is about 80% of the maximum day demand.

The maximum sustained demand to be withdrawn from the river is computed in the following table:

Table 1: City of Flint Design Demand Summary

Future Maximum Day Demand (Customers)		18.0 mgd
Future Maximum Day Demand (WTP Backwash / Process Water)		2.0 mgd
Subtotal (Future Maximum Day Demand)		20.0 mgd
Sustained (30 day) Future Maximum Day Demand	(80% of MDD)	16.0 mgd
Replenish Water from Fire Fighting		0.7 mgd
Future Maximum Day Demand (Source Water)		16.7 mgd

3.0 Additional Demands and Requirements

In addition to the demands from Section 2, the following demands must be accounted for:

3.1 Mutual Aid

The City and GCDC-WWS have a mutual aid agreement to supply each other water in the event of a disruption in supply or other emergency. The agreement provides that the city will supply GCDC-WWS up to 8 mgd.

For this analysis, it is assumed that an emergency will be corrected within 14 days. The volume of water that may be required is therefore: 14 days * 8,000,000 gal/day = 112,000,000 gal. This volume will be reserved from the reservoir volume.

3.2 Evaporation

Both the Holloway and Mott dams have been constructed since the drought period of the 1930's, which is being used as the base river flow for analysis. Evaporation from the Holloway Reservoir and Mott Lake will reduce the amount of available from the river. The NWS publishes an atlas which shows evaporation rates. Evaporation is primarily a factor during the "growing season"; the atlas shows that about 24" of water is lost via evaporation from open water surfaces in Genesee County over the May through October period. Loss by evaporation will be offset by the addition of rainfall directly upon the water surface. Since the analysis is based upon drought conditions, the low rainfall having a recurrence rate of 100 years will be used. During the May through October period, 11.5 inches of rain is estimated during the 1 in 100 dry year. The net loss by evaporation is therefore 12.5 inches.

The following table summarizes the loss by evaporation, over the six month period from May through October.

Table 2: Reservoir Evaporation Loss

Reservoir	Surface Area (Acres)	Evaporation (inches)	Precipitation (inches)	Net Loss by Evaporation (Gallons)
Holloway Reservoir	1,973	24	11.5	669,646,065
Mott Lake	684	24	11.5	232,153,020
Total				901,799,085

3.3 Siltation

The July 2001 Flint River Assessment completed by the MDNR indicates that sedimentation occurs in the Holloway Reservoir at an accelerated rate, but does not provide quantities. Measurements of the silt accumulation in the reservoir have not been completed. Accumulations of several feet have occurred in other reservoirs. Sedimentation of an average of 1 foot across the Holloway Reservoir will result in the loss of 643,000,000 gallons of storage, or about ten percent of the total volume available.

Mott Lake is not used as a water storage reservoir. Its level is controlled by a fixed weir. Although siltation likely occurs in Mott Lake too, it has no impact on storage for water supply.

3.4 Seepage

Seepage is not believed to have a significant impact on the availability of water at the WTP. Seepage through the embankments of either the Holloway or Mott dams or through the bottom of the reservoirs seems likely to migrate back to the Flint River, although perhaps downstream of the reservoirs, prior to the WTP.

3.5 Flint WWTP

The City's WWTP discharges treated wastewater to the Flint River. The NPDES permit issued to the WWTP has established limits for the treated effluent, based on a drought flow in the river of at least 85 cfs.

3.6 Holloway Reservoir Management Plan

In 1977 the City and Genesee County executed the Holloway Reservoir Management Plan (HRMP) which established parameters for the operation of the dam and reservoir. In 1977, water was no longer withdrawn from the river for water supply and the HRMP appears to have been developed to address four primary issues:

- Availability to utilize the reservoir for water supply as a backup or alternative supply
- Provide for physical maintenance of the dam
- Provide for the recreational use of the reservoir
- Provide flow augmentation to Flint WWTP

The HRMP establishes a summer operating level of 755 and a winter level 751. The summer level maximizes the volume of water available during the dry period in the event that the river is to be used as a water supply. The higher level also supports recreational activities on the reservoir. The 751 winter level provides protection against damage from freezing during the winter. The HRMP establishes a minimum discharge of 65 cfs from the dam, presumably to provide a minimum flow of 85 cfs in the river at the WWTP.

4.0 Analysis

It is assumed that the demands and other requirements identified above are to be maintained in the event that water is withdrawn from the Flint River for water supply. In 1963, USGS published Water Resources Flint Area Michigan, which includes an analysis of the river as a water supply. This publication includes design information regarding the Holloway Reservoir and its operation for water supply.

In 1977 when the HRMP was executed, water was not withdrawn from the river for water supply. If the HRMP required a minimum discharge of 65 cfs at the Holloway Dam to provide for adequate flow in the river at the WWTP, the minimum discharge from the Holloway Dam should be increased by the amount of water withdrawn for water supply if the current river flow at the WWTP is to be maintained.

65 cfs + 16.7 mgd (25.8 cfs) = 90.8 cfs (58.7 mgd)

Figure 1 shows the sustained discharge which can be maintained from the Holloway Reservoir during a drought period. This graph is based on USGS records of flow in the river between 1930 and 1952. This period includes the drought period of 1930 to 1937, which is USGS considers the most severe drought in Michigan history, having a recurrence period of 1 every 50 to 70 years. This period was prior to the construction of Holloway Dam, so river records reflect the natural flow of the river without impact by dam operations.

Figure 1: Draft-Storage Curve, Flint River near Otisville (excerpt from USGS Water Resources Flint Area Michigan)

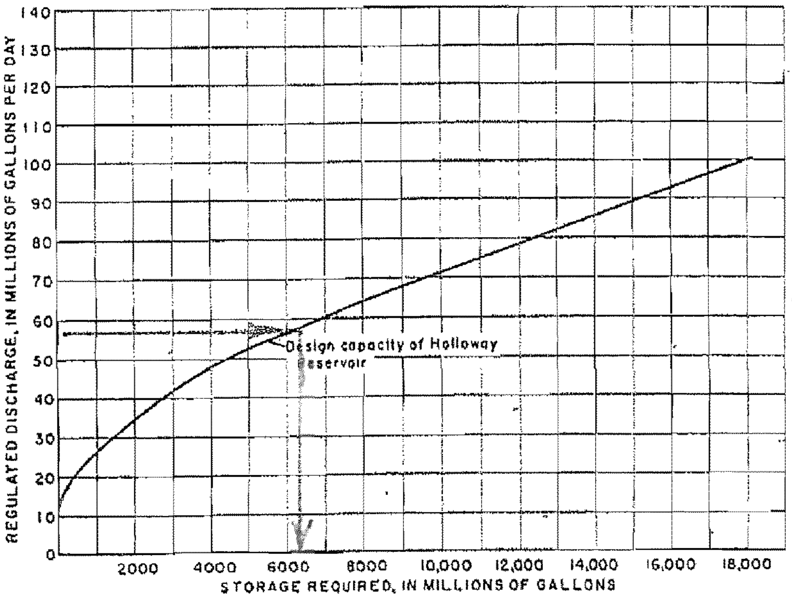

Figure 1 indicates that about 6.2 billion gallons of storage is needed to maintain a sustained discharge of 58.6 mgd from the reservoir to provide the minimum river flow of 85 cfs at the WWTP.

In addition to the 6.2 billion gallons of storage, additional storage is required to provide GCDC-WWS an emergency supply and to make up for reservoir loss by evaporation.

Table 3: Storage Requirements to Maintain Current Conditions plus Water Supply

Storage to meet sustained demand and WWTP flow:	6.20	billion gallons
Storage to provide backup supply to GCDC-WWS:	0.11	billion gallons
Storage to make up loss by evaporation:	0.90	billion gallons
Storage lost by siltation:	0.64	billion gallons (assumed)
Storage to provide loss by seepage:	0.00	billion gallons (assumed)
Storage Needed to Supplement River Flow:	7.85	billion gallons

For this analysis, it is assumed that storage is available from the Holloway Reservoir to supplement the natural river flow.

- The Holloway Reservoir was designed to provide storage for water supply in the 1950's
- The Mott Dam is a fixed weir, so storage is not available. The dam is owned by the Genesee county Parks Department and provides recreational benefit.
- The Hamilton Dam impoundment is limited to the river channel; storage volume is negligible.
- The Utah Dam is inoperable.

- The Kearsley Dam is not directly located on the Flint River, but on the Kearsley Creek just prior to its confluence with the Flint River. The Kearsley Creek discharges to the Flint River downstream of the City's WTP so storage from the river is not available for water supply; however, discharge from the Kearsley dam can be used to supplement downstream river flows, including the flow in the river at the WWTP. The Kearsley Reservoir can provide a maximum of 650 million gallons of storage.
- The Thread Lake Dam is not located on the Flint River, but the Thread Creek discharges into the Swartz Creek which discharges into the Flint River just west of the downtown area. The Thread Lake dam provides a maximum storage volume of 100 million gallons of storage. Discharge from the Thread Lake dam could be used to supplement downstream river flows, but not for water supply.
- For this analysis, storage from neither the Kearsley Reservoir nor Thread Lake is included. Both dams were constructed prior the Holloway Reservoir and discharges from the Kearsley Dam and Thread Lake Dam are assumed to be included in the analysis presented in the USGS publication.

Following is a capacity curve for the Holloway Reservoir, from the USGS Water Resources Flint Area.

Figure 2: Holloway Reservoir Storage Capacity (excerpt from USGS Water Resources Flint Area Michigan)

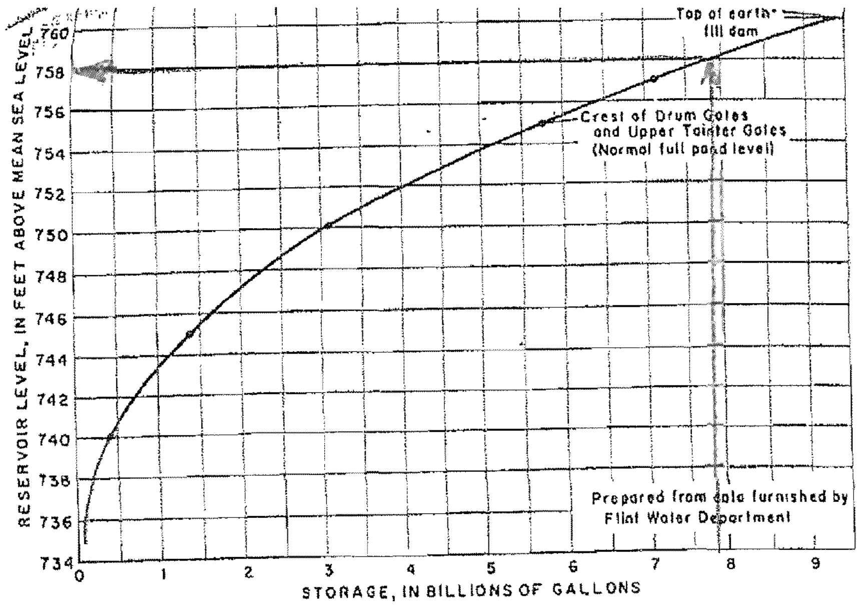

Figure 2 indicates that a Holloway Reservoir level of 758.0 feet provides storage of 7.85 billion gallons.

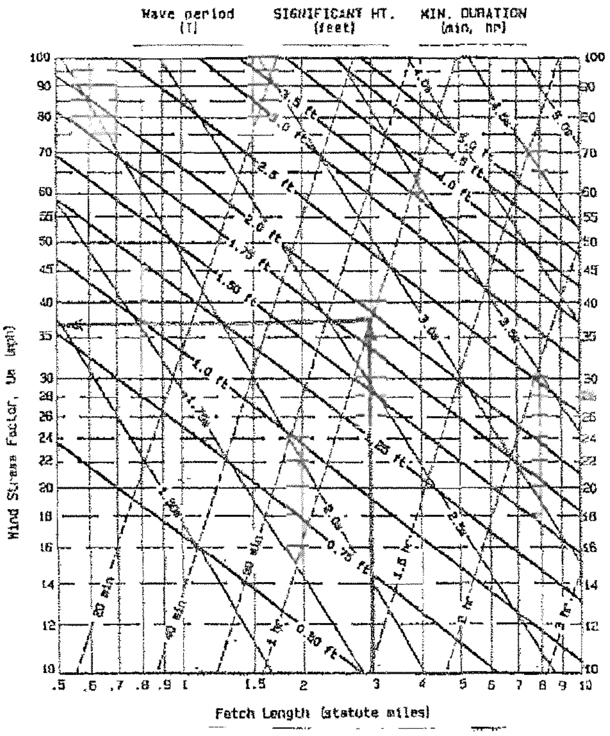
Review of design drawings of the Holloway Dam indicates that the dam was designed to use drum gates to maintain the normal water level(s) of the reservoir. The drum gates can rotate to allow for reservoir levels ranging from a low level of 751 feet to a high level of 755 feet. If the reservoir is to be maintained at a higher level than the current summer level of 755 feet, modifications will be required to the drum gates.

According to the original dam design drawings, the dam embankment was constructed to elevation 763 feet (however, the USGS reports shows the top elevation as 760 feet). If the reservoir level is raised to 758 feet, only about five feet of freeboard will be provided to guard against overtopping. There are three concerns regarding increasing the reservoir level from 755 to 758 feet.

The increased hydraulic pressure resulting from the higher water level on one side of the dam will result in increased seepage through the embankment, and a reduction in its integrity.

The reservoir has a fetch of about three miles east from the dam. Figure 3 shows that a 37 mph wind sustained for one hour duration from the east can result in waves capable of two feet. The original design drawings show rip-rap armoring on the reservoir side of the dam embankment to an elevation of 757 feet. Rip-rap armoring should be extended to at least two feet higher than the 758 feet level to protect against wave action.

Figure 3: Predicted Wave Action – Holloway Reservoir



The reservoir is tributary to a large watershed. There have been rapid increases in river flow (and reservoir level) soon after intense rain events in the watershed. A rain storm in June 1996 resulted in a 1.62 foot increase in the water level of the reservoir resulting in the opening of dam gates and discharge of 7,740 cfs. Reducing the freeboard also reduces the volume available for flood management.

5.0 Quantity of Water Supply Available

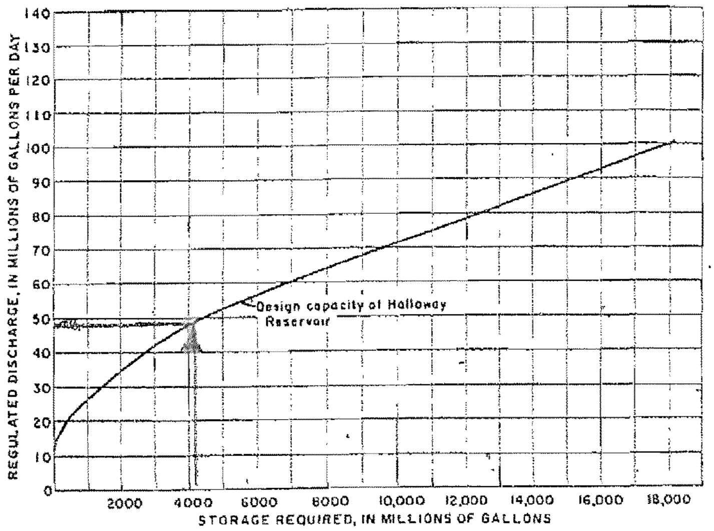
Analysis has shown that without modifications to facilities and/or permits and agreements, the river cannot supply the future maximum demand of the city.

Table 4: Storage Available for Water Supply

Original Storage Volume of Holloway Reservoir (elevation 755')	5.76	billion gallons
Storage lost by Sedimentation (assumed)	0.64	billion gallons
Storage to make up for Evaporation	0.9	billion gallons
Storage to provide backup supply for GCDC-WWS	0.11	billion gallons
Storage available to supplement river flow	4.11	billion gallons

The following figure shows that 4.11 billion gallons of storage can sustain a supplemental flow of 48 mgd.

Figure 4 – Sustained Discharge Available from Holloway Reservoir



A minimum discharge of 48 cfs from the Holloway Reservoir can support a sustained water withdrawal of about 11 mgd and maintain 85 cfs at the WWTP, as shown in the following table.

Table 5 – Maximum Sustained WTP Withdrawal Available

	1978 - Holloway Reservoir Management Plan	Future
Minimum Reservoir Discharge	65 cfs	48 cfs
River Inflow	20 cfs	20 cfs
WTP Withdrawal	0 cfs	17 cfs (10.99 Mgd)
River Flow at WWTP	85 cfs	85 cfs

A sustained water withdrawal of 11 mgd will support a maximum day demand of 11.6 mgd, as shown in the following table.

Table 6 – Available WTP Maximum Day Demand

Sustained Withdrawal Available		11.0 mgd
Water to replenish fire fighting		0.7 mgd
Sustained (30 day) Future Maximum Day Demand Available		10.3 mgd
Future Maximum Day Demand Available	(Multiply by 125%)	12.9 mgd
Water available for WTP Backwash/Process		1.3 mgd
Water available for customer Max Day Demand		11.6 mgd

HOLLOWAY DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

1.0 Purpose and Authority

The purpose of the report is to present a summary of findings for the field inspection of the Holloway Dam completed by Stantec Consulting Michigan Inc. (Stantec) on October 19, 2008 pursuant to the requirements of Part 315, Dam Safety, of the Natural Resources and Environmental Protection Act, 1994 P.A. 451, Section 31518.

This dam inspection Report and associated inspection activities were commissioned by the City of Flint, Michigan, the dam owner. The Holloway Dam is registered with the Michigan Department of Environmental Quality (MDEQ) as Dam Number 064.

References in the report to "left" and "right" are based on the observer facing downstream.

HOLLOWAY DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

2.0 Conclusions and Recommendations

The Holloway Dam was inspected on October 19, 2008 in accordance with Michigan P.A. 451, Part 315 criteria. The dam, including spillway and embankments was found to be in good condition. A summary of comments/recommendations is as follows:

1. The City of Flint should continue their operation and maintenance procedures as outlined in the "Holloway Reservoir Operation and Maintenance Plan".
2. The Emergency Action Plan should be exercised annually and Notification List concurrently updated.
3. Small brush should be removed from the left and right embankments.
4. Minor spalls and cracks in the spillway concrete should be monitored. These do not require immediate correction, but should be planned and budgeted in the City's long term Capital Improvement Plan (CIP).
5. The seepage monitoring weirs should be placed back into operation by repairing the eroded channel. Periodic observations of seepage rates and observed fines deposition should be performed and logged for long term data comparison.
6. Warning signs on the concrete abutments should be re-painted.
7. The security fence in the downstream right embankment should be repaired.
8. Monitor the sloughed area in the downstream right embankment and repair as needed.
9. Further inspections should be performed in accordance with P.A. 451, Part 315 regulations.

HOLLOWAY DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

3.0 Project Information

The Holloway Dam is located on the Flint River in Richfield Township, Genesee County, Michigan (Section 11, T8N, R5E). The dam and lower one fourth of the reservoir are in Genesee County while the upper three fourths of the reservoir are in Lapeer County. The dam was built in 1954 to maintain a base flow in the Flint River for water supply and sewage dilution requirements. The Holloway Dam was previously referred to as the Richfield Storage Dam. Presently the reservoir's uses are primarily, base water flow implementation, sewage dilution and recreation. The dam consists of earth embankments and a 248 ft long gated concrete spillway structure. The total length of the dam is approximately 3,350 ft between the natural moraine banks. The top of the embankment serves as a gravel road for maintenance purposes. A steel framed walkway spans the top of the spillway structure for operation and maintenance of the gates. The embankment side slopes are 3 horizontal to 1 vertical on the upstream face and 2 horizontal to 1 vertical on the downstream face.

3.1 PERTINENT DATA

The embankment is comprised of two zones: an upstream section and key trench of compacted impervious clay; and a larger downstream section of essentially granular material, predominantly sand with some gravel.

The plans show a sheet pile cutoff wall along the full length of the dam near the upstream toe, extending 23 ft below the base of the embankment and two feet into the embankment. A subdrain system, originating just downstream of the centerline of the crest and transverse to the dam axis, is also shown. The plans indicate that this subdrain system is formed by tile drain pipes with a center-to-center drain spacing of 15 ft. Plan details indicate a graded filter surrounding the tile drain pipes. The pipes empty into a collection ditch at the toe of the downstream slope. The right embankment has been modified by installation of fill at the toe with a bench located mid point on the slope. Weep drains were extended with 6" PVC pipe.

The outlet works of the dam consist of a reinforced concrete spillway controlled by seven gates. There is a control house on each end of the spillway. A telemark water level recording gage is in the left control house.

The following is a tabulation of principal data obtained from the construction drawings.

Hazard Classification – High (per 1978 USACE report).

Length of Dam – Overall length of the dam including the concrete spillway structure and the right and left embankments is approximately 3,350 ft.

Height of Dam – The total height of the dam, defined in P.A. 451, Part 315 as the difference in elevation between the natural stream bed and the design flood elevation, is approximately 30 ft. the crest of the dam is at El. 763.0 ft.

Crest Width of Embankments – Approximately 15 ft.

Side Slopes – The earth embankments have 3.0 H to 1.0 V slopes on the upstream face and 2.0 H to 1.0 V slopes on the downstream face. The right embankment downstream slope has been modified with fill at the toe and a bench at midpoint.

Spillway: 248 ft long concrete spillway structure with:

a) two 90 ft long drum gates

b) three 20 ft long taintor gates

c) two 4 ft by 6 ft sluice gates perpendicular to the dam axis

d) 75 ft by 248 ft wide discharge apron

Cutoff: 25 ft deep steel sheet pile cutoff wall at the upstream toe of the full length of the dam, and 15 ft deep steel sheet pile cutoff wall along the downstream side of the spillway structure.

Embankments: Upstream section and key trench of compacted impervious clay and a larger downstream section of granular material, predominantly sand with some gravel.

Further details of the spillway structure and embankments are shown in **Appendix A**. These figures have been taken from the 1978 Phase I Inspection Report.

4.0 Field Inspection

An inspection of the facilities was performed by Dana M. Dougherty, PE (Stantec) on October 19, 2008. The weather on the date of inspection was clear with temperature at approximately 55°F. The impoundment elevation was near normal (summer) i.e. 755. Flow was passing over the drum gates as well as through the left (looking downstream) sluicegate.

The following items were noted: (Referenced photographs can be found in **Appendix C**.)

4.1 SPILLWAY

Overall the spillway appeared to be in excellent condition. Recent preventative maintenance work includes painting of miscellaneous metals including handrails, gates, and support beams, installation of new galvanized steel grating on the gate operator platform and patching concrete at the upper downstream end of the taintor gate piers.

Some minor items were noted with regard to concrete condition including:

1. There was spalled concrete on the top of the upstream right wingwall. The face of the wall exhibited cracking and efflorescence at this location (Ref. Photos #3 and #4).
2. There was a small crack in the right abutment immediately above the drum gate. There is no evidence of movement or displacement at this crack (Ref. Photo #6). This should be monitored.
3. Minor alligator cracking was noted in the taintor gate piers (Ref. Photos #7 and #8). These do not pose any immediate concern but should be monitored.
4. There were cracks in the left abutment and left downstream retaining walls. No displacement was noted. These cracks should be monitored for future movement (Ref. Photos #9 and #10).
5. The upper portion of the downstream end of the left downstream retaining wall has alligator cracking and effervescence. This should be monitored (Ref. Photo #12).
6. The warning signs that are painted on the upstream abutment/wingwall faces are faded and difficult to read. These should be repainted.

4.2 RIGHT EMBANKMENT

Overall the condition of the right embankment appears to be good with no significant erosion, seepage, settlement, sloughing or animal burrows noted. The following specific items were noted:

1. There was a minor amount of erosion beneath the riprap on the upstream embankment face immediately adjacent to the spillway.

2. Some brush has begun to grow on the upstream slope. This should be selectively removed (Ref Photos #14 and #16). Small natural growth such as wildflowers and grasses should remain.

3. Considerable brush was observed on the downstream embankment face and within the toe-of-slope drain. This should be removed (Ref. Photos #17 and #20).

4. For the most part weep tiles are dry. There is one section midway in the embankment where the weep tiles are active. Some sloughing of the slope was observed in this area. It appeared that this has been addressed through addition of a blanket drain with geotextile fabric. This should be monitored for further displacement.

5. A short section of the security fence was in disrepair. This should be corrected (Ref. Photo #23).

6. The seepage monitoring weir is not functioning. Flow was passing around the weir through an eroded section. This should be corrected (Ref. Photo #24).

4.3 LEFT EMBANKMENT

The observed condition of the left embankment was good to excellent. There was no evidence of significant erosion, seepage, settlement, sloughing or animal burrows. The following specific items were noted:

1. A minor amount of small brush should be removed from the downstream slope (Ref. Photo #28).

2. There was no evidence of seepage from the weep drains, however the toe-of-slope drain was flowing, in particular the final 100 ft (Ref. Photo #29).

3. The seepage monitoring weir is not functioning similar to the right side. Flow was passing around the weir through an eroded section. This should be corrected (Ref. Photo #30).

5.0 Structural Stability

The assessment of stability is based on visual observations made during our field inspection (10/19/08).

No deficiencies were noted that would impact the structural integrity of the dam; however minor items were noted that should be proactively addressed to mitigate potential future deficiencies. Over all the condition of the facility remains good.

6.0 Hydrology and Hydraulics

The MDEQ has estimated the required spillway capacity at the Holloway Dam to be 9900 cfs (reference **Appendix B**). This equates to the 200 year frequency flood which is mandated by statute – P.A. 451, Part 315, Section 324.31516.

Headwater rating curves previously produced by the USACE (1978) and Acres International (1993) indicate that this discharge capacity can be met at an impoundment elevation of approximately 755. This would allow for approximately 8 feet of freeboard. Thus, the spillway discharge capacity is sufficient to meet P.A. 451, Part 315 requirements. Furthermore, the spillway capacity at overtopping (El. 763) is approximately 40,000 cfs or ½ PMF.

The spillway capacity has also been determined with the assumption that the drum gates fail to operate and are locked in the up position (reference Ayres, Lewis, Norris & May, Inc. (ALNM) Report – 1996). The resultant 200 year impoundment elevation is computed to be approximately 761 or two feet of freeboard. Therefore, the required spillway design capacity can be met through operation of the taintor gates only.

7.0 Operation and Maintenance

The dam is operated and maintained by staff from the City of Flint Water Treatment Plant. Routine operation and maintenance is performed in accordance with the Holloway Reservoir Operation and Maintenance Plan which is on file at the City of Flint WTP.

Impoundment elevation is continuously monitored via an on-site level transducer. Instantaneous level information is available remotely to assist operations personnel in maintenance of the impoundment elevation.

During summer months, the drum gates are in a raised position and taintor gates closed. The impoundment elevation is maintained between 755.0 and 755.75 by operating the drum and/or taintor gates as needed.

The impoundment elevation is lowered in the winter to approximately elevation 751.0. The drum gates are lowered during this period.

Emergency backup power is available to operate the taintor gates in case of a power loss. An *Auxiliary Generator Power System Report is available at the WTP.*

The City has performed routine maintenance of the facilities on an "as needed" basis. The most recent work consisted of painting exposed steel components including the taintor gates and access platform support steel.

In addition to routine surveillance by operations staff, supervisor staff also performs an annual inspection of the facilities. Noted deficiencies are scheduled for correction the following year.

UTAH DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

1.0 Purpose and Authority

The purpose of the report is to present a summary of findings for the field inspection of the Utah Dam completed by Stantec Consulting Michigan Inc. (Stantec) on October 19, 2008 pursuant to the requirements of Part 315, Dam Safety, of the Natural Resources and Environmental Protection Act, 1994 P.A. 451, Section 31518.

This dam inspection Report and associated inspection activities were commissioned by the City of Flint, Michigan, the dam owner. The Utah Dam is registered with the Michigan Department of Environmental Quality (MDEQ) as Dam Number 11275.

References in the report to "left" and "right" are based on the observer facing downstream.

2.0 Conclusions and Recommendations

The Utah Dam was inspected on October 19, 2008 in accordance with Michigan P.A. 451, Part 315 criteria. The dam was found to be in fair to poor condition. A summary of comments/recommendations is as follows:

1. The stability of the exposed portion of the structure is poor and is no longer capable of serving its intended purpose.
2. The operating components of the facility (floodgates) have been decommissioned for sometime and are no longer functional.
3. The purpose of the dam (impound water for the upstream water treatment plant) is no longer needed as the Hamilton Dam, which is located downstream, provides this capability.
4. The Hamilton Dam is currently being evaluated for potential reconstruction and should the decision be made to proceed with that project the Utah Dam will serve no useful future function.
5. The spillway hydraulic capacity is deficient with regard to P.A. 451, Part 315, Section 324.31516 rules. This is further exacerbated by the fact that the partially open gates impede high flows resulting in an increased backwater.
6. The City should consider full or partial removal of the dam. It is possible that the foundation and submerged portion of the piers may be reused to support a new pedestrian crossing bridge. The minimum removal effort would consist of removing the gates from the dam. Due to the aforementioned deficiencies and related public safety liabilities the City should take immediate action perhaps concurrent with the proposed Hamilton Dam reconstruction.

UTAH DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

3.0 Project Information

Utah Dam is located on the Flint River in the City of Flint, Genesee County, Michigan (T08N, R07E, Section 32) at the south end of Whaley Park. The site location map is shown in **Appendix A**.

Utah Dam is owned by the City of Flint and plans for the dam are on file with the City. It was designed by the Ambursen Dam Company of New York and San Francisco and built around 1928. The dam was constructed to maintain a reservoir at El. 711 to provide sufficient head on the City's water treatment plant intake pipe. The pool created by the dam was limited to the main channel of the Flint River. The dam was built between the two banks of the river and has a total length of 240 ft. It consists of a concrete gravity structure with six spillway bays and 4 ft wide piers. Each bay has a 12 ft high by 25 ft long vertical lift gate.

There are two bridge decks on the structure. The upper deck is approximately 11 ft wide and it is used to move the gate hoist along the length of the dam. The gate hoist travels the length of the dam on two No. 40 rails, each of which is supported by 15 inch "I' beams. The beams are supported by the piers.

The lower bridge deck is separated by the vertical lift gates. The downstream side of the deck is 7 ft wide and it serves as a pedestrian walkway. The upstream side of the deck is 5 ft wide and it is used by the operator to gain access to the upper deck via a steel ladder.

Presently, the dam serves as a walkway over the Flint River and as a backup for Hamilton dam for providing a head on the water intake pipe. The gates of Utah Dam are currently locked open above the normal backwater elevation created by Hamilton Dam, which is 2.2 miles downstream. Elevations given in this report are referenced to National Geodetic Vertical Datum.

Six spillway bays and vertical lift gates are contained within the structure. Pertinent data about Utah Dam is give below.

Height of Dam – The total height of the dam, defined in P.A. 451, Part 315 as the difference in elevation between the natural stream bed (El. 696.8 ft) and the design flood elevation (El. 717.2 ft) is approximately 20.4 ft.

Crest Width of Structure – 30 ft as measured along the lower deck.

Sill of Vertical Lift Gates – El. 697.3 ft.

Sketches of the dam are included in **Appendix A**.

4.0 Field Inspection

An inspection of the facilities was performed by Dana M. Dougherty, P.E. (Stantec) on October 19, 2008. The weather on the date of inspection was clear with temperature at approximately 55°F. The impoundment elevation was approximately 1.9 ft below normal elevation. The City was in the process of lowering the Hamilton Dam impoundment per directive from the MDEQ. This directive requires that the Hamilton Dam impoundment be lowered 3.25 ft.

The following items were noted (Reference photographs can be found in **Appendix C**):

1. The concrete condition on the downstream face of the dam is fair to poor. The right downstream retaining wall shows significant spalling in its top and outside corner. The left downstream retaining wall has significant spalling and cracking. The pier noses (three of five) are spalled. The access platform or walkway or the dam, concrete is in fair to poor condition. There is effervescence and cracking in the access platform support beams. There is no displacement. (Ref. Photos #1 and #5.)

2. The concrete condition of the upstream dam face is fair to poor. The noses of all piers show effervescence and some alligator cracking. This is also true for the right and left upstream retaining walls. There does not appear to be any substantial structural cracking in any of these members or displacement. There is spalling of concrete at the top of the piers as well as at the top of the abutment walls where the access platform rests. There is also some indication of spalling in the access platform beams and in some cases at the bottom of the beams themselves (Ref. Photos #2 and #6).

3. The gates are randomly open. The left gate, Bay No. 1, is 2 feet above the water level on this date. Bay No. 2 and No. 3 from the left, are 4 feet above water level on this date and Bay No. 4, 5, and 6 are 6.5 feet above water level. All dimensions reference water level to the bottom of the gate.

4. The superstructure appears to be in very poor condition. Concrete is in fair to poor condition. The operating platform, which housed a single moveable gantry crane for all six gates, has spalling in the beams as well as the piers. Protective railings are all intact, but in poor condition and require painting (Ref. Photos #7 and #8).

5. The top of the right embankment has a paved walkway with chain link fence on either side of the walkway. This is also true for the left embankment. There is also lighting at the site, utility poles in each embankment with a light fixture (Ref. Photos #3 and #4).

6. The embankments have some tree growth which should be removed.

7. On the date of the inspection, the water level is about 10.6 feet below the operating/walkway platform (El. 706.6 NGVD).

8. There is a 4 foot wide opening in the fence on the left downstream face of the dam, next to the utility pole, which allows access and is a safety issue. Also, the safety fencing that was installed on the upstream side of the dam, between the walkway and the gates, has been removed and is a safety issue.

5.0 Structural Stability

The assessment of stability is based on visual observations made during our field inspection (10/10/08).

The overall structural condition of the Utah Dam is categorized to be fair to poor. Substantial deteriorated concrete is evident with numerous spalls, cracks, and some exposed reinforcing steel. The superstructure concrete is in the poorest condition with the gate lift support structure no longer capable of supporting its intended function i.e. gate operation.

The condition of the access platforms and exposed portions of the piers is somewhat better than the superstructure but still would be categorized as poor. The submerged portion of the peirs and foundation were not inspected as part of this report, however experience with similar structures would imply that their condition would be better than the exposed components.

In conclusion, the Utah Dam structural stability will no longer support gate operation. Furthermore, continued use of the access platforms for pedestrian crossing will be dependent on future evaluation, repair and/or modification of those components.

UTAH DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

6.0 Hydrology and Hydraulics

The MDEQ has established the required spillway capacity at the Utah Dam to be 11,800 cfs (reference **Appendix B**). This equates to the 100 year frequency flood which is mandated by statute, P.A. 451, Part 315, Section 324.31516, for dams classified as low hazard such as the Utah Dam.

The hydraulic capacity of the Utah Dam is greatly impacted by the downstream Hamilton Dam. The normal impoundment elevation of the Hamilton Dam impoundment is approximately El. 708.0 (NGVD) while the gate sill elevation of the Utah Dam is 697.3. Thus, the Utah Dam is partially submerged under normal conditions.

Overtopping of the right embankment occurs at or near El. 714.0. The 1993 Acres Report (**Appendix B**) indicates that overtopping of this embankment will be experienced at flows over 7,830 cfs. The FEMA Flood Insurance Study (**Appendix B**) shows the 100 year flood elevation at the Utah Dam to be approximately El. 716.0. Thus the right embankment is overtopped under high flow conditions due to backwater impacts from the Hamilton Dam. It should be noted that the FEMA Flood Insurance Study assumes that all six gates are operable at Hamilton Dam. Since 1991 only three gates have been operable thus the backwater impact would be greater than shown on the FEMA maps.

The Utah Dam's hydraulic capacity is further diminished by the fact that the floodgates are currently locked in a partially open position. The bottom of gate elevation for each bay (numbered left to right looking downstream) is approximately:

Bay No. 1	708.5
Bays No. 2 and 3	710.5
Bays No. 4 through 6	713.0

Under high flows (100 year El. 716.0) the gates will impede flow thereby further exacerbating flood conditions.

For the above described reasons, it is concluded that the Utah Dam does not meet spillway capacity requirements as required by statute.

7.0 Operation and Maintenance

The Utah Dam is operated and maintained by staff from the City of Flint Water Treatment Plant. The floodgates are currently non-functional and are locked in a partially open position. Power has been disconnected from the gate operators. The impoundment elevation is maintained by the downstream Hamilton Dam thereby negating the usefulness of the Utah Dam.

The City staff therefore maintains a minimal surveillance effort at the dam. Minimal preventative maintenance has been performed in the recent past. It is the City's intent to remove all or a portion of the structure as funds become available. Until that time maintenance will be limited to those items necessary to insure public safety with regard to the pedestrian bridge crossing.

INSPECTION REPORT
HAMILTON DAM
CITY OF FLINT
GENESEE COUNTY, MICHIGAN

1.0 PURPOSE AND AUTHORITY

The purpose of this report is to present a summary of findings for the field inspection of the Hamilton Dam completed by Stantec Consulting Michigan Inc. on October 19, 2008 pursuant to the requirements of Part 315, Dam Safety, of the Natural Resources and Environmental Protection Act, 1994 P.A. 451, Section 31518.

This Dam Inspection Report and associated inspection activities were commissioned by the City of Flint, the dam owner. The Hamilton Dam is registered with the Michigan Department of Environmental Quality (MDEQ) as Dam Number 060.

References in this report to "left" and "right" are based on the observer facing downstream.

2.0 CONCLUSIONS AND RECOMMENDATIONS

The Hamilton Dam was inspected on October 19, 2008 in accordance with the Michigan P.A. 415, Part 315 criteria. The dam was found to be in poor condition which supports the conclusion found in previous dam safety reports. Specific comments/recommendations are as follows:

1. The stability of the exposed structural components including gate piers, access and operating platforms, and abutments is poor. These components are no longer capable of serving their intended purpose.
2. Three of the floodgates have been decommissioned while the reliability of the remaining gates is suspect. With three gates operating inadequate freeboard exists at the right embankment (looking downstream). In addition upstream flood elevations will be greater than those included in the FMEA Flood Insurance maps.
3. The MDEQ mandated drawdown should be adhered to until the dam is reconstructed.
4. The City should proceed immediately to implement the preferred option from the 2008 Reconstruction Feasibility Study.
5. In the interim, the City should exercise the Emergency Action Plan (EAP) annually to insure an efficient implementation when and if needed.

3.0 PROJECT INFORMATION

Hamilton Dam is located on the Flint River in downtown Flint, Michigan near the Flint Branch of the University of Michigan campus, and approximately 800 ft. upstream from the Saginaw Street Bridge.

Plans for the current dam are on file with the City of Flint, but original design data is not available. The dam was designed by Fargo Engineering Company of Jackson, Michigan, and was constructed about 1920 by Price Brothers Company of Lansing, Michigan on the site of a previous mill dam. The dam was constructed to sustain a head for the upstream water treatment plant intake.

The existing structure is a reinforced concrete gravity dam with six gated spillway bays. Each bay has a tainter gate on the fixed crest of a concrete spillway. The six bays, each 33 ft. long, and the five piers, each four feet thick, make a total length of 218 ft. There is an end sill below the spillway and an 18 ft. concrete apron beyond the end sill The gates are operated during flood flows.

The original 1920 dam had seven bays with tainter gates. In 1964, the southern (left) most gate, its spillway and headrace were removed.

A fish ladder was constructed through the right abutment sidewalls in 1978. Also in 1978, the right concrete abutment was modified to install an Archimedean screw pump.

Repairs to Hamilton Dam were carried out in the summer of 1992. Steel sheet piling was placed just upstream of the gates for Bays 1, 2 and 6 because of the deteriorated condition of the gates. The sheet piles were to maintain the headpond in case of gate failure. The top elevation of the sheet piles was placed near the top of the tainter gates (Elev. 707.8 ft.) in a closed position. Gate repairs were completed in Bays 3, 4, and 5. These repairs included the complete removal of the existing gates and replacement with new gates, repair of buttress and sill concrete, repair of gate trunnions, replacement of lift chains, and painting of all exposed gate steel.

The top deck of the structure is divided lengthwise into a pedestrian walkway and the gate hoist rails for the two gate hoists. The hoist rails consist of two "I" beams (18 inch and 15 inch) that are supported by the piers. The two hoists for raising the spillway tainter gates are driven by attached electric motors.

A U.S. Army Corps of Engineer's bronze disk is set flush with the bridge deck in the walkway at the second pier from the right end. Unless otherwise noted, data given in this report is based on the assumption that the E1 715.06 ft. elevation given for this benchmark is on National Geodetic Vertical Datum (NGVD).

The terrain near the dam and reservoir is urban and gently rolling. Five borings from the original plans show sand with an occasional pocket of clay or gravel in the soils overlying a soft sandstone which is 40 or 50 ft. below ground surface.

Six spillway bays and tainter gates make up the structure. Only Gates 3, 4 and 5 are currently operable. Sketches and pertinent data about Hamilton Dam are shown in **Appendix A**.

Hamilton Dam was classified by the U.S. Army Corp of Engineers as High Hazard in the 1980 Phase I Inspection Report. This classification remains in effect to date.

Plans for the original Dam construction in 1920 and plans for repairs performed in 1992 are on file with the City of Flint. Past inspection reports on file include the following:

- 1980 USACE, Phase I, National Dam Safety Program Report
- 1986 Ayres, Lewis, Norris & May, Inc. (ALNM) and Sublakes Diving Inspection Report
- 1988 MDNR Inspection Report
- 1989 Ayres, Lewis, Norris & May, Inc. (ALNM) Structural Evaluation and Reconstruction of Hamilton Dam Report
- 1993 Acres International Corp., Dam Inspection Report
- 1996 Ayres, Lewis, Norris & May, Inc. (ALNM) Inspection Report
- 1999 Paul C. Rizzo Associates, Inc. Dam Inspection Report
- 2000 USACE Hamilton Dam Condition Survey
- 2005 Soil & Materials Engineers, Inc. Dam Inspection Report
- 2008 Stantec Feasibility Study for Reconstruction

These reports have been consistent in their recommendations to undertake corrective action to address structural deficiencies within the facility. The 1989 Ayres, Lewis, Norris & May, Inc. (ALNM) and 2000 USACE Reports included estimated costs of $3,830,000 and $5,588,000 respectively to make the necessary improvements to insure dam safety and integrity. The 2008 Stantec Report estimated the reconstruction cost to be $4,901,000.

On March 14, 2008, acting under the authority of Part 315, Dam Safety of the Natural Resources and Environmental Protection Act, 1994 P.A. 451 as amended, the Michigan

Department of Environmental Quality issued an order to the City of Flint to drawdown the Hamilton impoundment 3.25 ft. to an elevation not greater than 705.25 NGVD for the purpose of public health, welfare and safety protection. The depth of necessary drawdown was computed by the MDEQ to eliminate the danger of loss of life downstream in the event of a sudden dam failure.

A permit under Part 301, Inland Lakes and Streams was issued for this activity on September 30, 2008. The City of Flint has subsequently abided by the conditions of this permit and has lowered the normal impoundment elevation to the prescribed elevation. It should also be noted that the MDEQ permit requires permanent deflation of the Obermeyer (Inflatable) Dam.

4.0 FIELD INSPECTION

An inspection of the facilities was performed on October 19, 2008 by Dana M. Dougherty, PE. The weather on the date of the inspection was clear with temperatures at approximately 55°F. The impoundment elevation was below normal by approximately 1.5 ft. The City was in the process of lowering the impoundment per directive from the MDEQ. This directive requires that the impoundment be lowered 3.25 ft. The floodgate in Bay #3 has been opened to accomplish this task.

The following items were noted during the field inspection (referenced photographs can be found in **Appendix C**):

1. The condition of the exposed concrete including piers, slabs, abutments is poor with numerous spalls, cracks and exposed reinforcing steel (Ref. Photos #1 through #4, #7, #8, #10).
2. The floodgates in Bays 1, 2 and 6 have been decommissioned by placement of steel sheeting across the face of these bays (Ref. Photos #2 and #8).
3. The City reports that the remaining floodgates (Bays 3 through 5) are operative, however, Bays 4 and 5 have not been operated with any frequency and thus their reliability is suspect.
4. The access walkway/platform remains closed to the public due to safety concerns (Ref. Photos #3 and #4).
5. Overall the condition of the dam continues to worsen with the structural integrity of numerous components compromised.

5.0 STRUCTURAL STABILITY

The assessment of stability is based on a visual observation made during our field inspection (10/19/08) and visual observations made during preparation of the 2008 Reconstruction Feasibility Study, as well as the 1989 condition survey (concrete corings).

The overall structural condition of the Hamilton Dam is poor. Exposed surfaces including gate piers, access and operating platforms and abutments all exhibit conditions that indicate these components have exceeded their useful life. Numerous spalls, cracks and exposed reinforcing steel exist.

In conclusion, the Hamilton Dam structural stability is deficient and thus this facility represents a potential liability with regard to public health, welfare and safety.

6.0 HYDROLOGY AND HYDRAULICS

The dam is regulated under State of Michigan P.A. 451 Part 315 statute. Guidelines that accompany this statute require high hazard potential dams with heights less than 40 ft. to be capable of passing a 200-year flood or the flood of record whichever is greater. For the Hamilton Dam, the 200-year flood controls and has been computed by the Michigan Department of Environmental Quality to be 13,000 cfs (reference **Appendix** B).

The computed maximum impoundment elevation for the 200-year flood event varies dependent on assumptions made with regard to the number of floodgates that are operative. In 1981, calculations were performed by the United States Geologic Survey and form the basis for the FEMA Flood Insurance mapping that is used to this day. The USGS assumed that all six floodgates were operational. The USACE also computed the maximum impoundment elevation in their 1981 National Dam Safety Inspection Report. They assumed that just two gates were operational due to the fact that the gates could not be locked in an open position and only two operators existed. In 1993 after decommissioning of Gates 1, 2 and 6, Acres International Corporation computed the maximum headwater elevation assuming that gates were operational in Bays 3, 4 and 5.

The results of these various studies is as follows (refer to **Appendix** B for more information):

Source	**Estimated 200-year Impoundment Elevation NGVD Datum**
1981 F.I.S. (U.S.G.S.)	709.05*
1981 Dam Safety Inspection Report (USACE)	711.6
1993 Dam Safety Inspection Report (ACRES)	712.8

** USGS added 0.95' to the computed impoundment elevation for the purpose of floodplain mapping. Therefore the floodplain mapping indicates a 200-year flood elevation of approximately 710.0 NGVD.*

It should be noted that there is uncertainty as to whether or not adequate freeboard exists at this site. The Acres report indicates that freeboard is sufficient based on the fact that the upstream right streambank area was raised in the mid 1980's. However, a recent survey conducted as part of the 2008 Reconstruction Feasibility Study indicates the elevation of this area to be similar to that shown in the 1981 USACE report i.e. ± 711.5 NGVD. Thus, it would appear that inadequate freeboard currently exists.

7.0 OPERATION AND MAINTENANCE

The Hamilton Dam is operated and maintained by staff from the City of Flint Water Treatment Plant. Floodgates in Bays 1, 2 and 6 are currently non-functional. Floodgates in the remaining bays can be operated, however their reliability is diminished due to the deteriorated condition of the operating slab.

City staff maintains the impoundment elevation by operating the gates on an as needed basis. The impoundment is currently being maintained at the MDEQ mandated level of 705.25 NGVD i.e. 3.25 ft below normal.

The City has performed minimal maintenance to the structure in anticipation of reconstruction.

Appendix 8 - Cost of Service Study – Flint Water Treatment Plant

DRAFT

Technical Memorandum
Cost of Service Study
Flint Water Treatment Plant

I. Introduction

This Technical Memorandum describes the proposed improvements needed at the Flint Water Plant to treat Flint River water on a continuous basis. The primary foundations for this evaluation were the "Water Treatment Plant Rehabilitation – Phase II" report dated December 2003 and the "Preliminary Engineering Report, Lake Huron Water Supply, Karegnondi Water Authority" dated September 2009. The findings, as presented in the following sections, address the improvements required for the water plant to produce finished water in conformance with the current federal and state drinking water regulations. In addition, operation and maintenance costs for continuous operation have been evaluated and included in order to determine the total cost associated with using the Flint River as a source of water.

Improvements, as proposed in this evaluation, along with those previously made during the Phase I improvements program, will produce a finished water quality equal to the current water quality as received from the DWSD. The design parameters are as follows:

1) Minimum Day Demand – 10-mgd
   Average Day Demand – 15-mgd (14-mgd in 2010 increasing to 15-mgd in 2050)
   Maximum Day Demand – 28-mgd

2) Turbidity – 0.20 NTU

3) Hardness – 80 to 100 mg/l as $CaCO_3$

4) Cryptosporidium – 3-Log Inactivation

5) Giardia – >3-Log Inactivation

6) Viruses – >4-Log Inactivation

7) Taste and Odor – Eliminated with pre-ozonation

8) Trihalomethanes – Less than 80 µg/l

9) HAA5 – Less than 60 µg/l

As part of this investigation, an inspection of the Flint Water Plant was performed on May 3, 2011. The purpose of this inspection was to determine if the recommendations in the Phase II report, as referenced above, needed to be revised due to changed conditions or water supply needs. Based on findings from this meeting, the major adjustment to be made is the reduction of average day demand from 20-mgd to 14-mgd and maximum day demand being reduced from 36-mgd to 28-mgd. Required improvements as recommended in this study have taken these new demands into account. The conceptual design of these new facilities would allow cost effective expansion to 36-mgd, as needed, to meet future demands.

II. Required Capital Improvements

The following describes the required improvements as required for the Flint Water Plant to operate on a continual basis using the Flint River as a water source. Most of these improvements are more fully described in the Phase II report and are not repeated to avoid duplicative effort.

A. Lime Sludge Disposal

Lime sludge is proposed to be pumped from the east and west softening basins to two new 42-ft diameter thickeners (25-ft SWD) located adjacent to the plate settling building. Decant from the thickener will flow by gravity to the primary clarifier influent channel. Thickened sludge (12% solids) will be pumped to a new plate-and-frame filter press located at the north end of the WTP 1 primary settling basin. A new two-story building would be constructed at that location to house the pumping facilities and presses. Each press, located on the second floor, will have a 225-cf per hour capacity and will drop the dewatered sludge into a first floor bunker area. The dewatered cake will be transferred to a lime storage concrete bunker located approximately 60 feet north of the sludge press building. The storage bunker (100-ft x 192-ft) will have the capacity to store three to four months of dewatered lime sludge cake. About every three months, contract haulers will remove the lime sludge and place on agricultural lands that are permitted for final disposal.

The capacities of these facilities are based on average day flow of 15-mgd, maximum day demand of 28-mgd and water quality softening requirements. Based on raw water quality data provided by the City of Flint, a lime dosage of 209 mg/l, soda ash dosage of 47 mg/l and carbon dioxide dosage of 37 mg/l were used to estimate lime sludge quantities and flows.

Opinion of Probable Cost:

Site and Access:			
Site Demolition	$ 129,000		
Roadway Improvements	$ 385,000		
Partial Settling Basin Demolition	$ 129,000		
On-site Truck Scale	$ 257,000		
Subtotal Construction:		$ 900,000	
Construction Contingencies (15%):		$ 135,000	
Design Contingencies (5%):		$ 45,000	
Engineering, Legal, Bonds & Administration (17%):		$ 153,000	
Opinion of Probable Cost:			**$ 1,233,000**

Thickener Basins - 42 ft Diameter:			
Two Thickener Mechanisms	$ 310,000		
Two Concrete Basins (25 ft SWD)	$ 513,000		
Two Geodesic Dome Covers	$ 180,000		
Install Equipment	$ 257,000		
Site Work	$ 97,000		
Utilities, Piping and Process	$ 193,000		
Subtotal Construction:		$ 1,550,000	
Construction Contingencies (15%):		$ 232,500	
Design Contingencies (5%):		$ 77,500	
Engineering, Legal, Bonds & Administration (17%):		$ 263,500	
Opinion of Probable Cost:			**$ 2,124,000**

Filter Presses and Building:

Two-225 cf Plate & Frame Press	$ 1,650,000		
Building (70 ft x 60 ft)	$ 3,331,000		
MEP	$ 1,089,000		
Site Utilities	$ 129,000		
Subtotal Construction:		$ 6,199,000	
Construction Contingencies (15%):		$ 929,850	
Design Contingencies (5%):		$ 309,950	
Engineering, Legal, Bonds & Administration (17%):		$ 1,053,830	
Opinion of Probable Cost:			**$ 8,493,000**

Lime Storage Bunker and Site Work:

12 ft Concrete Walls and Slab	$ 833,000		
Frame and Fabric Building Cover	$ 325,000		
Site Improvements	$ 385,000		
Front End Loader (5 cyd)	$ 308,000		
Site Utilities	$ 513,000		
Subtotal Construction:		$ 2,364,000	
Construction Contingencies (15%):		$ 354,600	
Design Contingencies (5%):		$ 118,200	
Engineering, Legal, Bonds & Administration (17%):		$ 401,880	
Opinion of Probable Cost:			**$ 3,239,000**
Total for Lime Disposal :			**$ 15,089,000**

B. Soda Ash Feed System

In order to remove the non-carbonate hardness, soda ash will be needed to meet the finished water hardness concentrations. Two new 800 #/hour feeders will be needed to meet the dosage requirements. Each of these feeders will be connected to the existing silos.

Opinion of Probable Cost:

Demolition of Existing Feeders	$ 20,000		
Two 800 #/hr Feeders	$ 112,000		
MEP	$ 109,000		
Chemical	$ 77,000		
New Pneumatic Fill System	$ 58,000		
Subtotal Construction:		$ 376,000	
Construction Contingencies (15%):		$ 56,400	
Design Contingencies (5%):		$ 18,800	
Engineering, Legal, Bonds & Administration (17%):		$ 63,920	
Opinion of Probable Cost:			**$ 516,000**

C. Additional Chemical Storage

During the Phase I improvements, the MDEQ did not mandate 30-day chemical bulk storage requirements since the plant was a redundant water supply to the DWSD. However, if the facility becomes a continuously operated treatment plant, then additional chemical storage must be added to meet the minimum storage volume requirements. To comply with the regulations, new oxygen, nitrogen and carbon dioxide storage facilities must be provided as follows.

Liquid Carbon Dioxide:
    Capacity – 34 tons
    Vaporizer – 750 #/hour @ 300 psig
    Piping – Schedule 80 Carbon Steel and Schedule 40 - 304L Stainless Steel

Liquid Oxygen
    Capacity – 9000 gallons
    Operating pressure – 75 psi
    Feed Rate – 175 scfm
    Piping – Type K Copper

Liquid Nitrogen
    Capacity – 540 gallons
    Operating pressure – 100 psi
    Feed Rate – 1 scfm
    Piping – Type K Copper

Opinion of Probable Cost:

Carbon Dioxide Storage Facilities	$	328,000		
MEP	$	103,000		
Oxygen & Nitrogen Storage Facilities	$	961,000		
MEP	$	109,000		
Subtotal Construction:			$	1,501,000
Construction Contingencies (15%):			$	225,150
Design Contingencies (5%):			$	75,050
Engineering, Legal, Bonds & Administration (17%):			$	255,170
Opinion of Probable Cost:			**$**	**2,057,000**

D. Electrical and SCADA Improvements

Section 9, relating to power and controls, of the Phase II study was prepared by Dmytryka Jacobs Engineers (DJE). The scope of the Phase II work did not include detailed investigations of the water plant site-wide power distribution nor the secondary power distribution within each of the facility structures. However, a number of observations and basic recommendations were presented in Section 9 by DJE.

The Flint Water Plant currently uses 2400V as primary power throughout the facility. All of the power feeders in the plant site are 5kV rated and it appears the existing switchgear is also rated at 5kV. Most of the major electrical improvements installed during Phase I were dual voltage (2400/4160) equipment in anticipation of the plant power being changed to 4160V in the near future. This change would allow the existing network of power feeders to handle approximately twice the power and would eliminate running new feeders to various portions of the plant.

The current sub-station has two 2.5MVA transformers running in parallel for a total capacity 5 MVA. These old transformers are not equipped with cooling fans. The full connected load to these transformers is estimated to be 6.97 MVA while the estimated power load at 36 MGD is 4.22MVA. Based on these estimates there is sufficient power for the plant with both sub-station transformers in service. Even though the transformers are owned by Consumers Energy, it could take weeks to replace one of these main transformers in the event of a unit failure, which will result in reduced treatment and pumping capacity. The sub-station switchgear was installed in 1960 and is antiquated and difficult to maintain.

The two existing Fairbanks Morse generators are currently inoperable and would cost approximately $1M to rehabilitate. The DJE team recommended installing two new emergency generators in lieu of re-building the existing units.

Section 9 of the Phase II report provides sufficient detail for the purposes of this report, but a detailed electric system evaluation of the entire plant should be performed prior to any major improvements to this facility.

While LAN did not perform a detailed review of the WTP electrical system during our site visit, it appears that all of the DJE findings are still pertinent. We, therefore, concur with the improvements as recommended by DJE in the Phase I report.

Opinion of Probable Cost:

Substation Upgrade	$	961,000		
Standby Power Generation	$	2,242,000		
Pump Station No. 4 Upgrade	$	1,365,000		
Filter Press Building Feeder	$	87,000		
WTP SCADA, Equipment & Programming	$	720,000		
Telemetry System Equipment & Programming	$	103,000		
Computers, Software & Training	$	155,000		
Filter Transfer PS Power Feeders	$	135,000		
Emergency PS Power Feeders	$	145,000		
Subtotal Construction:			$	5,913,000
Construction Contingencies (15%):			$	886,950
Design Contingencies (5%):			$	295,650
Engineering, Legal, Bonds & Administration (17%):			$	1,005,210
Opinion of Probable Cost:			**$**	**8,101,000**

E. Post-Chlorination and Zebra Mussel Control

The previous report recommended changing the disinfection system from gaseous chlorine to sodium hypochlorite due to the potential for hazardous gas release and the requirements imposed by new federal regulations. Previous treatability studies have not addressed the potential impact of re-growth in the system due to ozonation by-products. These impacts should be addressed prior to proceeding with final plans for using river water.

The Flint River is known to be infested with Zebra mussels and mitigation measures will have to be implemented if the plant is placed into continuous operation. A sodium permanganate feed system is proposed to address these concerns.

Opinion of Probable Cost:

Demolition of Existing Equipment	$ 39,000	
Storage Tanks	$ 9,000	
Metering Pumps and Tables	$ 11,000	
Piping, Valves & Tables	$ 9,000	
Containment	$ 59,000	
Installation	$ 108,000	
Subtotal Construction:		$ 235,000
Construction Contingencies (15%):		$ 35,250
Design Contingencies (5%):		$ 11,750
Engineering, Legal, Bonds & Administration (17%):		$ 39,950
Opinion of Probable Cost:		**$ 322,000**

F. Security Issues

For water plant security issues, please refer to City of Flint Vulnerability Assessment. Details are omitted in this report due to confidentiality.

Not available at the time of the previous report, a source water monitoring system is included in the study due to recent advancements in technology. The proposed system design is based on Hach Model SC1000, equipped with UVAS, NH4D, pH, ORP, turbidity and DO probes.

Opinion of Probable Cost:

Security Improvements	$ 145,000	
Source Water Monitoring System	$ 95,000	
Subtotal Construction:		$ 240,000
Construction Contingencies (15%):		$ 36,000
Design Contingencies (5%):		$ 12,000
Engineering, Legal, Bonds & Administration (17%):		$ 40,800
Opinion of Probable Cost:		**$ 329,000**

G. PS No. 4 - Low and High Service Pumps

Section 7 of the Phase II report included recommendations to replace two of the low lift pumps and two of the high lift pumps along with various other improvements. During the site visit, it was apparent the condition of this facility has continued to deteriorate. Furthermore, with the reduction in water system demands, the various pump capacities are no longer properly sized to efficiently meet the new plant flow ranges. The pumps and motors are oversized and are operating outside their best efficiency ranges and should be replaced due to age, condition and cost to operate.

Additionally, some of these pumps cannot be operated due to excessive vibrations in the shaft and steady bearings. Existing vibration monitors are functioning as designed and are shutting the power off to the motors to avoid damage.

For low lift service, it is proposed to install two 10-mgd and two 15-mgd (nominal ratings) vertically mounted pumps equipped with low voltage inverter duty motors. The motors would be powered by low voltage variable frequency drives. This will provide a firm rated capacity of approximately 35-mgd in low lift capacity.

For high lift service, it is proposed to install one 10-mgd, two 15-mgd and one 20-mgd (nominal ratings) pumps equipped with medium voltage inverter duty motors. These motors will be power by medium voltage variable frequency drives. This combination of pumps will provide a firm rated capacity of 40-mgd.

Opinion of Probable Cost:

Demolition of Existing Equipment	$	135,000		
Install Two (2) 10 MGD @ 40 ft of TDH Vertically Mounted Pumps with 125 HP, 480 V Inverter Duty Motor with 20 ft of Shaft & Steady Bearings	$	473,000		
Install Two (2) 15 MGD @ 40 ft of TDH Vertically Mounted Pumps with 150 HP, 480 V Inverter Duty Motor with 20 ft of Shaft & Steady Bearings	$	495,000		
Install One (1) 10 MGD @ 190 ft of TDH Vertically Mounted Pump with 450 HP, 4160 V Inverter Duty Motor with 20 ft of Shaft & Steady Bearings	$	245,000		
Install Two (2) 15 MGD @ 190 ft of TDH Vertically Mounted Pumps with 700 HP, 4160 V Inverter Duty Motor with 20 ft of Shaft & Steady Bearings	$	520,000		
Install One (1) 20 MGD @ 190 ft of TDH Vertically Mounted Pump with 800 HP, 4160 V Inverter Duty Motor with 20 ft of Shaft & Steady Bearings	$	285,000		
Piping, Valves, Supports & Bearings	$	480,000		
Intermediate Platforms, Ladders & Stairs	$	360,000		
Ventilation & Boiler Systems	$	340,000		
Install Three (3) Low Voltage VFD Units	$	85,000		
Install Four (4) Medium Voltage VFD Units	$	2,250,000		
Subtotal Construction:			$	5,668,000
Construction Contingencies (15%):			$	850,200
Design Contingencies (5%):			$	283,400
Engineering, Legal, Bonds & Administration (17%):			$	963,560

Opinion of Probable Cost: $ 7,766,000

H. Filter Transfer Station to Dort Reservoir and UV Inactivation

Under the requirements as outlined in the USEPA drinking water regulations addressing potential microbial contaminants, additional treatment technologies and enhancement of existing processes must be implemented to comply with these regulations.

As required under the enhanced surface water treatment rules, it is essential for water utilities to address giardia, cryptosporidium, viruses and bacteria in finished water. The level of treatment is dependent on the source water classification. The City of Flint will need to perform a two-year source water study to determine the bin placement for the Flint River. For the purposes of this report, a Bin 4 placement was selected due to the nature of the watershed and, therefore, it is assumed enhanced Ct and UV inactivation will be required.

Reservoir No. 3 does not provide sufficient Ct to meet the current regulations, therefore, Dort Reservoir will need to be placed into the process train. Since Dort Reservoir does not match the hydraulic profile of the plant, an intermediate pump station will be required. This new facility will also include a UV inactivation system to comply with the enhanced water quality regulations.

This proposed facility, located west of the filters and south of Dort Reservoir, will house three 14-mgd (nominal rating) variable speed pumps with inverter duty, low voltage motors for a firm rated capacity of 28-mgd. Housed in a separate part of this same structure will be the UV system that will be equipped with three 12" medium pressure units with a rated capacity of 28-mgd.

Opinion of Probable Cost:

Site Work & Utilities	$ 77,000	
Building (80 ft x 60 ft)	$ 1,440,000	
Three (3) 14 MGD @ 40 ft of TDH, Vertically Mounted Pumps with 150 HP, 480 V Inverter Duty Motor	$ 535,000	
MEP	$ 940,000	
Valves and Controls	$ 205,000	
Install Three (3) 12" MP UV Units	$ 590,000	
UV Piping & Controls	$ 368,000	
Ventilation & Boiler Systems	$ 165,000	
Install Three (3) Low Voltage VFD Units	$ 85,000	
Piping Connections	$ 125,000	
200 ft of 30" Water Main	$ 200,000	
600 ft of 36" Water Main	$ 420,000	
Subtotal Construction:		$ 5,150,000
Construction Contingencies (15%):		$ 772,500
Design Contingencies (5%):		$ 257,500
Engineering, Legal, Bonds & Administration (17%):		$ 875,500

Opinion of Probable Cost: $ 7,056,000

I. Emergency Interconnect Pumping Station

The City of Flint and Genesee County DWWS have entered into an agreement to provide 8-mgd of back-up service to each other under emergency conditions. There are several alternatives for pumping station locations and configurations to accomplish this interconnect. For the purposes of this report, a station located west of the filter building was selected as the most practical from and operational cost perspective. While the opinions of cost presented below indicate that these pumps will be housed in their own structure, it is feasible to house the pumps in the filter transfer station for potential savings.

Preliminary design for this pumping station include two constant speed 8-mgd pumps equipped with soft starts and medium voltage motors. A reverse flow control station will be included within the same structure to allow for flow from the DWWS to assist the City of Flint. Approximately three miles of 24-inch pipeline will be needed to connect the two systems.
Opinion of Probable Cost:

Site Work & Utilities	$	90,000		
Building (32 ft x 24 ft)	$	245,000		
Install Two (2) 8 MGD @ 290 ft of TDH, Vertically Mounted Pumps with 600 HP, 4160V Motor	$	380,000		
MEP	$	335,000		
Valves and Controls	$	128,000		
Reverse Flow Control Station	$	110,000		
Ventilation Systems	$	35,000		
16000 ft of 24" Water Main	$	4,992,000		
Subtotal Construction:			$	6,315,000
Construction Contingencies (15%):			$	947,250
Design Contingencies (5%):			$	315,750
Engineering, Legal, Bonds & Administration (17%):			$	1,073,550
Opinion of Probable Cost:			**$**	**8,652,000**

The opinions of capital cost presented in the preceding sections are tied to an ENR Index of 8688 to match the September 2009 Lake Huron Water Supply Report. Furthermore, the contingency percentages included with each opinion of cost are the same as in the September 2009 report. The total opinion of probable project cost of these proposed improvements is as follows:

Lime Sludge Disposal	$	15,089,000
Soda Ash Feed System	$	516,000
Additional Chemical Storage	$	2,057,000
Electrical and SCADA Improvements	$	8,101,000
Post-Chlorination and Zebra Mussel Control	$	322,000
Security Issues	$	329,000
PS No. 4 - Low & High Service Pumps	$	7,766,000
Filter Transfer Pumping Station & UV	$	7,056,000
Emergency Interconnect Pumping Station	$	8,652,000
Total Opinion of Probable Project Cost:	**$**	**49,888,000**

III. Cost of Additional Operation

The City of Flint currently operates the water treatment plant periodically during the year to maintain the systems and to meet regulatory requirements. The water treatment plant is staffed with various classifications of employees to operate and maintain the facility for these minimal operations.

As part of this work, and to develop all costs of providing water service from the Flint River, it is necessary to determine the probable cost for operating and maintaining this facility for continuous operation. Water quality differences between the Flint River and Lake Huron are significant and require different treatment chemicals and dosages. Most noticeable is the fact that Lake Huron water does not require softening which negates the need for softening process and the associated lime sludge disposal.

The primary cost parameters that are included in this difference are labor, chemicals, residual disposal and electrical power. Each will be discussed in the following sections. These costs were projected through the year 2050.

A. Labor

Additional staffing was discussed and developed with representatives from the City of Flint to provide full time coverage on a 24/7/365 schedule, plus provide staff for residual management and operations of the various dams. Hourly rates and fringe benefits were based on current budget figures and inflated at a rate of 3% for future costs. The following table outlines the proposed staffing a cost for this operational element.

Classification	Number	Cost/Hr	Hrs/Year	Total	Fringe (%)	Total
Operators	12	$ 20.00	2080	$ 499,200	90.40%	$ 950,477
Maintenance	4	$ 25.00	2080	$ 208,000	90.40%	$ 396,032
Laboratory QA/QC	2	$ 24.00	2080	$ 99,840	90.40%	$ 190,095
Laboratory SDWA	2	$ 20.00	2080	$ 83,200	90.40%	$ 158,413
Planned Overtime	NA	MIXED	8320	$ 178,048	90.40%	$ 339,003

This estimate represents approximately $2,034,000 per year of additional labor.

B. Chemicals

Chemical costs are based on the projected average day water demand of 14-mgd and the average dose for each of the chemicals based on the raw water quality information and other operational records. Further, data from the previous treatability work performed during the Phase I improvements was also incorporated into these estimates. Chemical suppliers and other water utilities were contacted to obtain current chemical purchase costs which were adjusted by the ENR ratio back to an index of 8688. Where necessary, transportation costs to the Flint, MI area were included. The following summarizes the chemical costs associated with treating the Flint River water.

Chemical	Dose(mg/l)	Cost/#	Cost/ MGD
Ferric	44.50	$0.24	$89.07
Lime	209.00	$0.10	$174.31
Soda Ash	47.00	$0.29	$113.67
CO_2	37.00	$0.10	$30.86
Cl_2	3.00	$0.34	$8.51
Fluoride	1.00	$0.33	$2.75
Phosphate*	1.00	$0.51	$4.25
		Cost per MGD	$423.42

*Costs range from $0.51 to $0.96 per pound

In addition to the above, the cost of ozone will need to be added which is approximately $20.08 per million gallons per day per mg/l dose. This cost includes oxygen, nitrogen and power costs.

C. Residual Disposal

This category is divided into two groups: clarifier sludge collected in the plate settling basins and lime sludge from the softening process. The clarifier sludge is pumped from the clarifier basins by zone (six zones per train, three trains, total of 18 zones) to the plant main drain. As part of the Phase I work, the main drain was connected to a new wastewater pumping station located south of the filter gallery building. This pump station discharges the collected residuals to the city's sanitary sewer system. Nearly all of the filter wash water is recirculated back to the head of the ozone facility for re-use.

The cost to treat clarified sludge discharged into the sanitary sewer system is calculated as follows:

Plate Clarifier Sludge	
Flow (MGD)	14
SS (mg/l)	75
Primary Sludge (#/d	13,435
% Solids	2%
Sludge (gals/day)	80,500
Sludge (cf/day)	10,762

Based on the City of Flint's current wastewater charges of $1.00 per 100 cf, the annual cost would be $39,200 per year.

Lime/Soda Ash softening generates large quantities of residual wastes that have high disposal costs. The treatment proposed in this study involves pumping the sludge, at about 4% concentration, from the softening basins to two gravity thickeners, where it will concentrate to about 12% solids. After thickening, sludge will be pumped to the filter presses to be dewatered to approximately 55% solids. The filter presses will drop the cake into a lower bunker where it will be removed by an end loader to the main storage bunker. About every three months, the sludge will be loaded onto trucks and applied to agricultural land.

The volume of sludge is estimated as follows:

Sludge Production from Clarifier

Reaction	meq/l	meq/l as $CaCO_3$	meq/l as $Mg(OH)_2$
CO_2	0.25	0.25	0
$Ca(HCO_3)_2$	4.65	9.30	0
$Mg(HCO_3)_2$	0.30	0.60	0.30
$MgSO_4$	0.89	0.89	0.89
Excess Lime	1.25	1.25	0
	Total meq/l	12.28	1.19
	Less Practical Limits meg/l	0.60	0.20
	Precipitate Produced meq/l	11.68	0.99
	Precipitate Produced mg/l	584	49
	Precipitate Produced #/MG	4872	412
	Total #/MG	5284	

WTP Flow (MGD)	14	27		
Dry Sludge Production in #/day	73,983	142,681		
@ 4% Solids (gals/day)	221,771	427,701		
@ 12% Solids (gals/day)	73,924	142,567		
@ 12% Solids (gals/week)	517,466	997,970		
Dry Sludge Production (tons/week)	259		SG $CaCO_3$	2.71
Number of Hours per Week to Press	48		SG $Mg(OH)_2$	2.36
Dry Sludge Processed (#/hr)	10,789		SG solids	2.68
@ 55% Solids Sludge Processed (#/hr)	19,617			
55% Solids Sludge (#/cy)	2571		Sludge Solids =	55% as $CaCO_3$
@ 55% Solids Sludge Processed (cf/hr)	206		Sludge Unit Wt. =	95.22 pcf

Based on the preceding, 471 tons of softening sludge at 55% solids will be handled each week based on average flow and chemical dosage. Several Michigan water facilities were contacted to obtain lime sludge hauling and disposal costs. From this data a rate of $18.50 per wet ton was selected as a reasonable rate for disposal cost. This rate will result in an annual cost of $453,000.

D. Power

Practically all of the additional power costs are associated with low lift, intermediate transfer and high service pumping. Additional power costs will be used for process and handling of the softening sludge. The City of Flint is currently paying $0.07 per kwhr for service at the water plant. Power costs are calculated as follows:

TDH (ft) - High	190
TDH (ft) - Filter Transfer	40
TDH (ft) - Low	40
TDH Total (ft)	270
Pump Eff. (W to W)	80.00%
$/kwhr	$0.070
Pumping Cost Per MGD	$99.51
Solids Handling per MGD	$4.98
Total Power Cost per MGD	$104.49

Annual costs associated with the operation and maintenance of the Flint Water Plant are summarized in the attached tables following this section.

IV. Project Implementation Schedule

There are a number of issues that will impact the implementation schedule for this work. The source water studies to define bin number associated with cryptosporidium and giardia will take approximately two years. Part of these studies can be performed concurrently with design, but sufficient work will need to be performed to avoid impacting design schedule or work. A planning period of one year should be allowed for preliminary water quality and regulatory evaluations prior to initiating design work. Design of this project will require 10 to 12 months, with an additional three months required for permitting. After permits are received, allow three months for bidding and contract execution. Major equipment procurement and construction will take from 24 to 30 months. Plant commissioning will take about 2 months.

Total time required from notice to proceed to project completion 52 months to 60 months. This time frame does not include financing issues.

Subject: FYI: Washington Post Article today - In Flint, Mich., there's so much lead in children's blood that a state of emergency is declared

https://www.washingtonpost.com/news/morning-mix/wp/2015/12/15/toxic-water-soaring-lead-levels-in-childrens-blood-create-state-of-emergency-in-flint-mich/

In Flint, Mich., there's so much lead in children's blood that a state of emergency is declared

By Yanan Wang December 15 at 4:31 AM

For months, worried parents in Flint, Mich., arrived at their pediatricians' offices in droves. Holding a toddler by the hand or an infant in their arms, they all have the same question: Are their children being poisoned?

To find out, all it takes is a prick of the finger, a small letting of blood. If tests come back positive, the potentially severe consequences are far more difficult to discern.

That's how lead works. It leaves its mark quietly, with a virtually invisible trail. But years later, when a child shows signs of a learning disability or behavioral issues, lead's prior presence in the bloodstream suddenly becomes inescapable.

According to the World Health Organization, "lead affects children's brain development resulting in reduced intelligence quotient (IQ), behavioral changes such as shortening of attention span and increased antisocial behavior, and reduced educational attainment. Lead exposure also causes anemia, hypertension, renal impairment, immunotoxicity and toxicity to the reproductive organs. The neurological and behavioral effects of lead are believed to be irreversible."

The Hurley Medical Center, in Flint, released a study in September that confirmed what many

Flint parents had feared for over a year: The proportion of infants and children with above-average levels of lead in their blood has nearly doubled since the city switched from the Detroit water system to using the Flint River as its water source, in 2014.

The crisis reached a nadir Monday night, when Flint Mayor Karen Weaver declared a state of emergency.

“The City of Flint has experienced a Manmade disaster,” Weaver said in a declaratory statement.

The mayor — elected after her predecessor, Dayne Walling, experienced fallout from his administration’s handling of the water problems — said in the statement that she was seeking support from the federal government to deal with the “irreversible” effects of lead exposure on the city’s children. Weaver thinks that these health consequences will lead to a greater need for special education and mental health services, as well as developments in the juvenile justice system.

“Do we meet the criteria [for a disaster area]? I don’t know,” she told Michigan Live. But Weaver doesn’t think the city can receive the help it needs without alerting federal officials to the urgency of the matter.

To those living in Flint, the announcement may feel as if it has been a long time coming.

Almost immediately after the city started drawing from the Flint River in April 2014, residents began complaining about the water, which they said was cloudy in appearance and emitted a foul odor.

Since then, complications from the water coming from the Flint River have only piled up. Although city and state officials initially denied that the water was unsafe, the state issued a notice informing Flint residents that their water contained unlawful levels of trihalomethanes, a chlorine byproduct linked to cancer and other diseases.

Protesters marched to City Hall in the fierce Michigan cold, calling for officials to reconnect

Flint's water to the Detroit system. The use of the Flint River was supposed to be temporary, set to end in 2016 after a pipeline to Lake Huron's Karegnondi Water Authority is finished.

A petition lobbying for the ending the city's Flint River water supply garnered 26,000 signatures.

Through continued demonstrations by Flint residents and mounting scientific evidence of the water's toxins, city and state officials offered various solutions — from asking residents to boil their water to providing them with water filters — in an attempt to work around the need to reconnect to the Detroit system.

That call was finally made by Gov. Rick Snyder (R) on Oct. 8. He announced that he had a plan for coming up with the $12 million to switch Flint back to the Detroit system. On Oct. 16, water started flowing again from Detroit to Flint.

This, too, was accompanied by the sense that it had come too late, particularly for the parents of children who may have been permanently affected.

These parents and other Flint residents filed a class-action federal lawsuit against Snyder, the state, the city and 13 other public officials in November for the damages they have suffered as a result of the lead-tainted water. The suit, which claims to represent "tens of thousands of residents," alleges that the city and state officials "deliberately deprived" them of their 14th Amendment rights by replacing formerly safe drinking water with a cheaper alternative that was known to be highly toxic.

"For more than 18 months, state and local government officials ignored irrefutable evidence that the water pumped from the Flint River exposed [residents] to extreme toxicity," the complaint reads. "The deliberately false denials about the safety of the Flint River water was as deadly as it was arrogant."

Calling officials' conduct "so egregious and so outrageous that it shocks the conscience," the complaint cites the specific experiences of a few plaintiffs and their families, all of whom allege they have been challenged by similar health ailments since high levels of lead and copper entered their bloodstreams.

These conditions include skin lesions, hair loss, chemical-induced hypertension, vision loss and depression. Of the four families described in the complaint, two had ceased to drink Flint water after a certain point — and used it only for washing and cooking — but still said they were exposed to many of the same ill effects.

As the Detroit Free Press reported in October, avoiding Flint water became a way of life for the city's residents.

Those who could afford it opted for bottled water, buying it by the gallons. Those who couldn't spare the money drank it straight from the tap all the same, knowing that they would be paying for it later. When it came to bathing, some slowly filled bathtubs with pots of boiled water for their children.

LeeAnn Walters, a Flint resident and mother of 4-year-old twins, took every precaution after blood tests revealed that the level of lead in one of her sons had soared after the switch to Flint River.

"I was hysterical," Walters told the Free Press. "I cried when they gave me my first lead report."

She had feared lead was the problem when her whole family developed rashes and her son stopped gaining weight.

Now, Walters said, when her children experience problems as they grow up, she will always wonder whether things would have been different — if their lives would have been better — if it weren't for the water.

Subject: Al Jazeera inquiry about Flint

HQ sent us this draft response to an Al Jazeera this morning … they need us to provide input on several of the questions. This version has supposedly been reviewed by Joel Beauvais. Anne has handed hard copies of the inquiry to the task force members (they're all on a conference call now).

Would you like to discuss this at the beginning of your 11:30 briefing? (Anne and I will both need to leave at noon to take the mandatory EEO training.)

Subject: FW: TRAVIS REVIEW: MEDIA INQUIRY: Flint questions

Jeff/Anne – need to get these answers on Flint to Al Jazeera ASAP. I've noted which ones we need your team to answer and which ones we just need sign off on. Thanks.

1. Can you shed some light on what guidance was sent to the state in regard to appropriate testing for lead levels?

Need R5 to answer

2. • [Need R5 edits.] At all times during this water crisis, was the City of Flint properly

following federal rules when testing the water and informing the public about possible lead concerns in the water? Was the City of Flint properly testing for Lead and Copper in the water?

During the course of the water crisis, the city of Flint was found to be in violation of several National Primary Drinking Water Regulations, including the xx rules, but was not in violation of the Lead and Copper Rule. EPA has established a technical task force to assist the city and state with ensuing that corrosion control in the system is re-optimized as quickly as possible.

3 – [Need R5 input since you all would have provided input to MI on the recommended testing protocols.] The director of Michigan's Department of Environmental Quality indicated that at some point during Michigan's testing the EPA sent out guidance about the approved testing protocol they were using. It was testing protocol that he now says he feels was not putting the public health first. Can you shed some light on what guidance was sent to the state in regard to appropriate testing for lead levels?

Without knowing which guidance is specifically referenced, EPA cannot provide the clarification requested in the question. However, guidance has been provided to all primacy agencies regarding collecting samples and calculating compliance(http://www.epa.gov/dwreginfo/lead-and-copper-rule-compliance-help-primacy-agencies#clarifiaction) .Furthermore, additional guidance regarding LCR compliance for primacy agencies is also available (http://www.epa.gov/dwreginfo/lead-and-copper-rule-compliance-help-primacy-agencies#clarifiaction)

4: [Need R5 edits.] According to Federal rules, should the City of Flint have had corrosion control in place prior to switching its water source from Detroit to the Flint River?

In accordance with federal rules, the City of Flint ensured corrosion control was in place prior to switching its water source from Detroit to the Flint River. However, the steps that the City of Flint was required to take upon switching sources from Detroit Water were not clearly addressed by the LCR (specifically, how corrosion control treatment should be maintained when a community switches to a new source of water). To clarify these steps, on

November 3, 2015, EPA issued a memorandum that clarifies corrosion control practices.

5: [Need R5 edits.] Lastly, Marc Edwards' testing methods (using wide-mouth sampling containers etc) were much different than the state's (using narrow sampling containers.) Were they both acceptable under the federal rules during the testing, and are they both currently acceptable under the rules today?

EPA's sampling collection methods for lead can be found in 40 CFR 141.86. Currently, the regulations do not specify the type of sampling container required, and while the use of a narrow-mouth container may not be the easiest protocol for collecting samples, this approach is acceptable under the rule.

Hi Monica,

Is it okay if this slips to tomorrow? They're such sensitive responses that - even if I get a response in the next hour - I'd really prefer if we gave Joel the opportunity to review.

Also, related, I think we're going to have to ask Region 5 to weigh in on #1 and #3. We've drafted a general response, but I think it'll need to go to them for comment.

Subject: Agenda and location of the NDWAC meeting this week

Workgroup members, agenda and details of the meeting is below. The meeting place is at the **Crystal City Marriott** (not to be confused with the Crystal Gateway Marriott). The hotel is a short walk away from the Crystal City metro station.

http://www.marriott.com/hotels/maps/travel/wascc-crystal-city-marriott-at-reagan-national-airport/

Summary

On November 2, 2015, the U.S. Environmental Protection Agency (EPA) announced a meeting of the National Drinking Water Advisory Council (NDWAC) in the Federal Register, as authorized under the Safe Drinking Water Act. This notice announces the location of the meeting (see the ADDRESSES section of this notice). The meeting is scheduled for November 17, 18 and 19, 2015. During this meeting, the NDWAC will focus discussions on developing recommendations for the EPA Administrator on the Lead and Copper National Primary Drinking Water Regulation—Long Term Revisions.

Dates

The meeting on November 17, 2015, will be held from 8:30 a.m. to 4:15 p.m.; November 18, 2015, from 8 a.m. to 5 p.m.; and November 19, 2015, from 8 a.m. to noon, eastern standard time.

Addresses

The public meeting will be held at the Crystal City Marriott at Reagan National Airport, 1999 Jefferson Davis Highway, Arlington, Virginia 22202.

Hi Bentley,

Thanks, this is very helpful! We'll work on it in that order. Once I get a sense of our timeline for getting you the TA, I'll circle back.

You're correct on Section 7. The Reduction of Lead in Drinking Water Act addressed the definition of "lead-free" plumbing, solder, etc. The law went into effect at the beginning of 2014. EPA has a website that provides information: http://www.epa.gov/dwstandardsregulations/section-1417-safe-drinking-water-act-prohibition-use-lead-pipes-solder-and

Subject: RE: Lead-Free Drinking Water Act: TA requested

Hi Cathy and Denise,

To help facilitate the TA, we prioritized the sections in this bill, starting with the most important from our perspective and then descending in importance. Feel free to send along TA as you finish it, or you may send along TA in waves, a few sections at a time.

•□□□□□□□□ Section 2 – Revision of National Primary Drinking Water Regulations for Lead

•□□□□□□□□ Section 4 – Public Notice and Education

•□□□□□□□□ Section 8 – Lead in Schools

•□□□□□□□□ Section 5 – Additional Provisions: providing filters, lead testing in federal buildings, national-wide “reboot” lead test, monitoring and corrosion control revisions to drinking water regulations

•□□□□□□□□ Section 3 – Service Line Replacement

•□□□□□□□□ Section 6 – Service Line Replacement Fund

It is our understanding that in the 111th Congress, legislation was passed regarding Section 7 of the bill, to address lead in solders, fluxes, plumbing fitting and fixtures, etc.

Thanks again.

-Bentley

Subject: Lead-Free Drinking Water Act: TA requested

Hi Cathy and Denise,

We are looking at various ways to ensure that what happened in Flint does not happen again in Michigan or across the country. Senator Peters is very concerned about providing lead-free drinking water, monitoring our water systems, and notifying/educating the public about the serious adverse health effects of lead in drinking water.

After the discovery of widespread lead contamination in Washington, D.C. drinking water, the Lead-Free Drinking Water Act was introduced in the 109th and the 110th Congress, which offered various proposals to amend the Safe Drinking Water Act to ensure safe, lead-free drinking water.

We realize that some provisions may now be redundant, out-of-date, or simply unfeasible. Senator Peters requests technical assistance and/or feedback as soon as possible on the Lead-Free Drinking Water Act, and specifically what provisions would be relevant today. If EPA has any views that were made public back when the bill was introduced in 2005 or in 2007, we would be interested in reading those as well. The 109th Congress version is attached.

Thank you for your work on this.

Connor Corcoran

Subject: Conversation with MDHHS regarding draft Phosphate Factsheet

INTERNAL COMMUNICATIONS

Hi everyone,

In order to improve internal communication re: Flint activities, avoid duplication and prevent inconsistent messaging, Tom Poy and Rita would like to begin weekly Flint meetings (first meeting-TBD). Also, they agreed that those involved with Flint should cc or bcc each other on all related emails as FYI. I've started a list to help identify those who should be included in email listing.

Tom P., Rita, Nick, Miguel, Andrea, Mostafa, Heather, Jennifer, Kim

Please let me know if I've missed someone.

Just FYI on Flint stuff that I've been working on...

-Yesterday, I spoke with Linda Dykema, Division Director of the MDHHS, who confirmed that her office – along with USEPA-Cinc (Mike Shock and Darryl Lyttle), Genesee County Health Department, and ATSDR, developed a phosphate factsheet. Although the draft has been reviewed by all organizations for technical accuracy, the factsheet is still in their communication's office awaiting approval. She shared the draft with me but strongly requested that we not distribute it outside of EPA. She hopes the factsheet will be released soon but couldn't give a timeframe.

-Prior to learning about the MDHHS factsheet, Tim Henry asked that I develop an EPA health statement re: phosphates. I have a strong draft and will have OW/OST review and finalize the language to help with future inquiries (especiallly if the MDHHS factsheet is not available soon). What I've developed is not in conflict with their info (see below).

- Yesterday, I provided a very brief response to Mr. Woodson's inquiry regarding phosphate safety. Basically, I directed him to NSF's factsheet. He sent a reply noted that the response was not helpful. Until we have approved an health statement or factsheets, I don't have much for him but did reach out to NSF for help (see next bullet).

- I contacted NSF and asked if they had consumer-friendly info to distribute regarding the toxicological evaluation of phosphate products. They said that they would work on it provided I send a formal request to their office (done!).

DRAFT HEALTH STATEMENT

Why is phosphate added to drinking water?

Public water systems commonly add phosphate to drinking water to minimize the release of lead from pipes. Phosphate works by forming a protective coating on the inside of pipes and household plumbing. This coating acts as a liner to keep corrosive water from dissolving the lead into the drinking water.

What is phosphate?

Phosphate, a salt of phosphoric acid, is a natural mineral found in rocks. It is an essential nutrient and naturally present in foods (such as dairy products, meat, poultry and nuts). In addition, it has been used for decades as a food ingredient and has wide commercial application in such items as cleaning products, toothpaste, fire extinguishers, and fertilizers.

How much is added to my drinking water?

Phosphate must be maintained at proper levels to ensure that lead is reduced. The target levels will vary depending on the system design and distribution system. Typically, phosphate levels are between 0.5 and 3.0 milligrams per liter (PO_4^{3-}).

Are there health risks?

EPA believes that the addition of phosphate poses little health risks at the dose required for lead reduction. Higher phosphate levels are found in food and soft drinks (e.g., colas) than in tap water. Most importantly, the potential health benefit from decreased lead levels is much greater in comparison to the negligible risk from phosphates. In addition, FDA regulates phosphate in food and considers it, "generally recognized as safe" and unlikely to cause adverse effects.

How do we know if these chemicals are safe?

The American National Standards Institute (ANSI) and the National Sanitation Foundation (NSF) have developed standards to certify the safety of chemicals used in drinking water. Phosphate products are certified additives under the *NSF Standard 60* and as such, required to undergo a complete analysis including a toxicological evaluation. More information can be found at: http://www.phosphatesfacts.org/pdfs/NSF_International_Statement_-_Phosphate_Treatment_Chemicals.pdf

Subject: Draft Statement about shake-down

Hey guys, please see below -- does this make sense? If so we can share it more widely for comment. Let's come up with an alternative to "shake-down". Miguel – I think we should get your idea about running the plant off the Detroit water into the discussion somewhere down the road. I think it would confuse things right now.

#####

The Flint drinking water treatment plant will need to be run through a "shake-down" period using KWA supplied water, before the water is distributed to the public. Flint will need to work with their consultant and MDEQ to define the parameters against which the plant performance will be assessed to define a successful outcome (i.e., define objective performance criteria). KWA water should not be distributed to the public until those criteria are satisfied.

During the shake-down period Flint will need to distribute to the public water from an alternate source; as water is already received from Detroit (Great Lakes Water Authority), that is an obvious choice for that interim period. How long the shake-down period lasts is a function of how long it takes the system to consistently meet the performance criteria. EPA has been informed that an objective of the Flint water plant will be to produce treated water that "mimics" the quality of the water received from Detroit; there are benefits to establishing this as an performance criterion as described below.

Flint and its consultant can complete a number of assessments prior to the completion of the KWA source that may help expedite the shake-down process and we encourage them to do so. For example, bench top jar tests using similar source water are planned and will help to establish operating parameters for the treatment plant processes. Assessment of corrosion control treatment using Detroit source water may be transferrable to the KWA source water if the Flint treatment plant produces water of comparable quality to the Detroit water; this could limit the amount of time in shake-down needed to assess performance of corrosion control treatment. EPA is planning to work with the city to set up pipe loops at the Flint treatment plant and we are targeting having them in place to assess ongoing corrosion control treatment in January 2016.

Subject: Pipe Rig Funding Needs

The $30K sought is to allow for the construction of a pipe loop rig at the Flint Treatment Plant. The following describes the assessment work that will be done using the rig. Additional funds will be required to complete all the work described.

Corrosion Control Treatment Optimization Evaluations

The corrosion control treatment optimization evaluations are necessarily separated into two stages. The first stage is intended to optimize corrosion control treatment with the current water source and water quality conditions. The second stage is designed to prepare for the transition to the new water source (KWA Pipeline) and water quality conditions, and to ensure that the City of Flint is able to simultaneously comply with all National Primary Drinking Water Regulations following the transition to the new source.

Short-Term (Current) Lead Release Optimization Evaluation. A lead pipe rig system will be constructed at the Flint water treatment plant with exhumed lead pipes, carefully collected and installed into the pipe rig. EPA-ORD will provide technical assistance in the rig design and construction, as well as the design provisions for chemical additions. One to two people will be required to be on-site to perform periodic chemical analyses and operate and maintain the pipe rig system, as well as to troubleshoot/repair any problems and to collect samples. Laboratory instruments for pH and colorimetric tests (chlorine residual, orthophosphate) will be needed on site. It is anticipated that the design will include a “control” loop and loops with possibly 3-4 different dosages, in duplicate. The estimated sampling frequency would be at least three times per week, using ICP for metals and ICP-MS for lead on each sample, with one complete characterization sample before each stagnation period. Filtration apparatus will also be needed.

Linda Dykema already KNEW about the Wash Post article; I guess Genessee County was not happy with the delays of getting this fact sheet finalized, so they just gave it to the mayor. She said she didn't need the info I had collected on Phosphates, since the draft is going thru review.

She said she has weekly calls with Genessee County Health Dept (Thursdays), and she will check with the County on the status of their plan to have Americorp volunteers walk door to door in Flint to distribute voluntary consumer education. I said I would contact her Monday to check in with her on this project.

FYI, Linda Dykema's direct line is Personal Phone / Ex. 6 She said she will be working Mon, Tues,Wed next week.

Subject: Funding for Flint Task Force

Hi Tom –

A couple of weeks ago I spoke to you about a request from the Flint Safe Drinking Water Task Force to cover the cost of construction of a pipe loop rig at the Flint Treatment Plant to assess the effectiveness of corrosion control treatment. The Task Force has an urgent need for $30K to build the pipe rig and to conduct the first stage of testing to assess the effectiveness of corrosion control treatment being used in connection with water supplied from Detroit by the Great Lakes Water Authority. Would it be possible for Cindy to provide Darren Lytle and Michael Shock with access to this funding by the end of the week? Additional funding may be required to complete the second stage of testing, which will be conducted to prepare for transition to the new source of water supplied by the Karegnondi Water Authority – but we can discuss that after the holidays.

Here’s a description of the work that the Task Force plans to do:

Corrosion Control Treatment Optimization Evaluations

The corrosion control treatment optimization evaluations are necessarily separated into two stages. The first stage is intended to optimize corrosion control treatment with the current water source and water quality conditions. The second stage is designed to prepare for the transition to the new water source (KWA Pipeline) and water quality conditions, and to ensure that the City of Flint is able to simultaneously comply with all National Primary Drinking Water Regulations following the transition to the new source.

Short-Term (Current) Lead Release Optimization Evaluation. A lead pipe rig system will be constructed at the Flint water treatment plant with exhumed lead pipes, carefully collected and installed into the pipe rig. EPA-ORD will provide technical assistance in the rig design and construction, as well as the design provisions for chemical additions. One to two people will be required to be on-site to perform periodic chemical analyses and operate and maintain the pipe rig system, as well as to troubleshoot/repair any problems and to collect samples. Laboratory instruments for pH and colorimetric tests (chlorine residual, orthophosphate) will be needed on site. It is anticipated that the design will include a “control” loop and loops with possibly 3-4 different dosages, in duplicate. The estimated sampling frequency would be at least three times per week, using ICP for metals and ICP-MS for lead on each sample, with one complete characterization sample before each stagnation period. Filtration apparatus will also be needed.

Thanks in advance for your help with this,

Susan

Yep, we have it. There were two issues that started to get mixed up, but have been straightened out. The first was whether anyone suggested or planned corrosion control for the interim period on Flint River water, and then whether anyone has actually initiated corrosion control studies for the transition from the Flint River to KWA/Lake Huron.

It will be good to have the weekly branch meetings on Flint so that we can keep folks updated on what's going on.

FYI, In case you don't already have this document:

Preliminary Engineering Report: Lake Huron Water Supply, Karegnondi Water Authority. September 2009. Prepared by AECOM, Jones & Henry Engineers LTD, Lockwood Andrews and Newnam Inc, O'Malia Consulting, ROWE Professional Services Company, and Wade Trim Inc. on behalf of City of Flint, Genessee County, Lapeer County, and Sanilac County.
ftp://cityofswartzcreek.org/2010%20Full%20Council%20Packets/2010-May-24%20Mtg,%20Budget%20-%20Karegnondi%20Report/May%2024%20Mtg,%20Karegnondi%20Water%20Line%20Engineering%20Study.pdf

Note: Appendix 9 (p338-357 of the pdf) includes a detailed description of the Flint WTP and recommendations for modifications after the proposed change to Lake Huron water. The future recommendations include (see "9.3.6 - Corrosion Control and Sequestering Agent") phosphoric acid at 1-2 mg/L in the treated Lake Huron water.

Thanks,
Val

Mike,

Thanks so much for all the documents you sent. I had seen the "City of Flint Water Supply Assessment, February 2013" previously. When I looked at it today, I found that the document I was looking for was listed on page 6 which is the "Analysis of the Flint River as a Permanent Water Supply for the City of Flint, 2011." After some Googling and subscribing to SCRIBD.com, I found the attached documents which are the report and its appendices. Neither document considers corrosion control treatment as a parameter to be addressed, although a cost estimate for phosphate addition is included in Appendix 8. I'm not sure if Flint followed any of the recommendations in this report before switching sources. What I have found interesting is that the "City of Flint Water Supply Assessment, February 2013", which was conducted by the Michigan State Treasurer's Office, recommended that Flint continue buying water from Detroit, but the State Emergency Manager(s) allowed Flint to contract with the Karegnondi Water Authority. Politics anyone?

Subject: RE: Flint River Study

Hi, George;

This is all that I have, and I don't think there ever was a competent, technical study done to focus on the corrosion control impacts. These studies were aimed at water quantity aspects, except the one that looked at THMs. I am thinking that the 2013 Water Supply Assessment document attached may be the study referenced on the flintwaterstudy.org web site. The study was commissioned in 2011 but finished in 2013. No mention of corrosion control for lead, though.

The mistake made to go from Detroit to Flint River water was predictable with the knowledge of even 30-35 years ago. You can't put a water with a pH of 7.5 or so into a system full of lead pipes. End of story.

And certainly not put it into brass and soldered copper with a boatload of chloride, on top of the low pH. The central problem is that the LCR framework cannot currently prevent the implementation of knowingly incompetent, stupid technical decisions. States are generally powerless to stop it, even if they know better. And sometimes they either don't know better, or don't care. This situation was both. State guidance is to pre-flush for 3-4 minutes before LCR sampling stagnation (Flint instructions said 5 minutes), 6-8 hours standing with no use from that faucet, then add it to many houses having plastic interior plumbing because either old galvanized pipe failed or copper was stolen during vacant periods. Additionally, there was no verification that sites sampled actually met the targeting criteria of the LCR. This is a clinic on LCR flaws.

The consultants, DEQ and Flint apparently all thought that "lime softening" was sufficient for corrosion control, though they did not take into account that using recarbonation to lower the pH by a couple of units undid any benefit. Plus, quick calculations Darren did from monthly operating data suggested wild swings in pH (though always too low) and carbonate concentration, so that whole process was out of control.

The Veolia report reflects a scary lack of concern about the lead. They suggested saving lime and reducing softening, but focused on TTHMs and the aesthetic aspect of discolored water from iron corrosion and main breaks. Their suggestion was POLYPHOSPHATE addition as a partial solution, absolutely the worst thing they could do for lead on top of the low pH.

--Mike

Hi George,

I read that article but I do not have a copy of the report mentioned. Mike Schock and Darren Lytle have had more contact with the Flint folks, so I'm copying them to see if they have seen it.

Subject: Flint River Study

Miguel,

I've been following the Flint lead issue mainly by checking the flintwaterstudy.org web site. In one of the articles posted there that I read last week, which I can't find now, it was mentioned that the City of Flint in 2011 had a contractor prepare a report on what would be needed if they began to use the flint River as a permanent source. It was further stated that the City submitted this report to the Michigan DEQ sometime in 2013. However, it appears that the DEQ did not consider the report when they allowed Flint to switch sources. I'm wondering if you have seen this 2011 report, and if so, could you send me a copy. I'm really curious about the report's recommendations, as a source switch like Flint's is probably a rare occurrence. I think that we might want to clarify what may be needed to approved a source change as part of the LCRLTR and/or LCR guidance. The 2011 report might be helpful in considering what might be needed in the LCR and its guidance.

I know that you're on the Flint work group so there's no rush to send me the report if you have access to it. Thanks.

George

Subject: Part 2 of Michigan Radio documentary: How people in Flint were stripped of a basic human need: safe drinking water

We'll send the complete Flint clips package around later this morning …

http://michiganradio.org/post/how-people-flint-were-stripped-basic-human-need-safe-drinking-water

How people in Flint were stripped of a basic human need: safe drinking water

By LINDSEY SMITH • MICHIGAN RADIO

The tap water in Lee Ann Walters' home in Flint was causing her family's health problems. Tests show her water had extremely high lead levels. Her son Gavin was diagnosed with lead poisoning.

"How does this happen in the United States?" she asks. "I mean, you hear about it in third world countries, but how does this happen, specifically in a state that is surrounded by the Great Lakes?"

It's a good question. How did this happen?

To understand, we have to go back to 2013.

Flint was broke -- like “nearing bankruptcy” broke.

Flint had a string of these state-appointed financial hatchetmen during this time -- trying to get the city’s finances straight.

They were looking for savings everywhere, and they had their eyes on the expensive water they buy from Detroit, so when Genesee County decided to build a new water system, one that’s separate from Detroit, Flint was definitely interested in joining.

Once it was clear Flint could save millions of dollars a year with the new system, Flint got on board.

But there was a catch. The new water system wasn’t built yet, and it wouldn’t be ready until the summer of 2016, at the earliest.

And once Detroit realized Flint was going to leave its system, it jacked Flint’s water rates up even more – to the tune of $10 million over the two years the new pipeline would be under construction.

So in the spring of 2013, Detroit kind of had Flint over a barrel.

It was state treasury officials who got creative.

Their solution?

Forget Detroit, Flint's emergency manager said. Let Flint get really cheap water from the Flint River.

That brings us to April 25, 2014.

It was a Friday morning. A small group of city and state officials got together inside the Flint water plant. It was a big day. The day Flint stopped buying Detroit's water.

There was a countdown, and then Flint Mayor Dayne Walling pushed a tiny black button.

That push of a button closed a valve in an underground pipe that brought water from Detroit. Flint was officially cut off from Detroit's water.

To celebrate, the group took small clear plastic cups, and filled them with the city's new drinking water. In TV station WNEM's report from that day, you can see the group come together in a small circle. They raise their plastic cups, smile, and make a toast.

But the celebrations didn't last long.

City residents started complaining right away.

The water was brown or reddish.

It stank.

It tasted weird.

Darnell Earley was Flint's emergency manager at the time of the switch.

"What we have to do is respond to that, find a way to fix it, make it better and move on," said Earley.

Things did not get better.

Four months after the switch, the city detected E. coli in the water. E. coli is a nasty bacterium. It can make you very sick, and it can even cause kidney failure in kids and the elderly.

Residents were told to boil their water. These boil water advisories came out right around the time kids were heading back to school.

Phylis Brock is a lunch lady at Flint Community Schools. She says there was one little girl who would come into the cafeteria in the mornings, and she was really concerned about the water Brock was using to make her oatmeal.

The little girl's mom told her to be careful.

"'So I had to go back and forth with her for about three days. 'It's bottled water' – 'Yes, I boil it' – 'Mom said no' – and so finally I've convinced her. She'll eat oatmeal again," said Brock.

Brock's boss, the executive chef at Flint Community Schools, Wally Janeczek, said there were other problems.

“Some of our cooks started mentioning about how the water was smelling and that when they turned it on, it didn’t look quite right,” he said.

Janeczek didn’t take any chances. Five months after the switch, he started buying gallons of bottled water in bulk to prepare and wash all of the school food.

Janeczek’s main concern was the E. coli. You can’t make food for a school full of kids laced with bacteria that can make you violently ill. And Flint did get a handle on the E. coli problem, but killing the bacteria brought a whole new set of problems.

The city started dumping chlorine into the water system. Now people complained the water smelled like a swimming pool.

Flint resident Amber Hasan says the smell wasn’t the scary part.

“My eyes are burning in the shower and I was like, ‘oh my goodness, like, what’s going on?’ I get out the shower and I can’t see for a minute because my eyes are burning from whatever,” said Hasan.

Meanwhile, six miles south of Hasan’s house, Lee Anne Walters started noticing alarming clumps of hair in her shower drain.

“I had lost a bunch of hair,” says Walters. “At one point I had lost all my eyelashes. I still wear fake eyelashes because my eyelashes did not grow back what they were before. It makes me very self-conscious, so that’s now why I wear fakes.”

Flint’s water damaging to car parts

If you're thinking these people are delicate flowers with sensitive skin and eyes, consider this: Flint's water was so caustic; it was damaging car parts at one of General Motors' engine plants. Tom Wickham is a spokesman for GM's Flint operations.

"So what happened was we had employees who were checking the parts and they noticed there's something wrong here. There was some corrosion, some rust forming and they decided to raise the red flag," says Wickham.

GM tried to treat the water to get rid of the extra chlorine that Wickham says was rusting the engine parts. It didn't work well, so they brought in semi-trucks full of water instead.

It wasn't cheap.

"I don't have that number and that's not something we'd disclose," he says. "When I look at, what I was told at the time was, 'it's just a lot of money.'"

But GM was kind of lucky. A sliver of the company's sprawling property is technically in Flint Township, not the city of Flint, and Flint Township still gets its water from Detroit. GM discovered it could hook up through the township and get its water from Detroit again.

So eight months after the switch, GM left Flint's water system. The company was one of Flint's largest water customers. GM pulling out meant the city lost almost half a million dollars a year.

And then, a month later – nine months after the switch – people living in Flint got a notice in the mail. The notice said Flint was in violation of the Federal Safe Drinking Water Act.

It turns out: the city dumped too much chlorine in the water, so much that a by-product of the disinfectant, called trihalomethane, was above levels set by the federal government. Over time, exposure to trihalomethane can increase the risk of cancer and other health problems.

Getting nowhere with city and state officials

It's no surprise that angry people showed up again in droves at city hall, but their concerns were pretty much blown off.

"The city water is safe to drink," said then-mayor Dayne Walling. "My family and I drink it and use it every day."

Walling is a former mayor now, thanks to the water crisis.

By this time, people were bypassing city hall – which wasn't offering much help, or even acknowledging the problem.

In January 2015, in single-digit cold, people like Mike Sargent took matters into their own hands. They started giving out cases of free bottled water. Sargent spent the morning loading them into people's cars and trucks.

"You know, I knew that our intention would only be a band-aid on all that needed help," says Sargent.

By this time, Flint had a new emergency manager. Jerry Ambrose insisted the water was safe. In fact, Ambrose seemed more concerned about bad press than bad water.

“It doesn’t have to travel very far out of Flint to see that this news has been picked up not just in the Flint area, but throughout the state, and even beyond that,” said Ambrose. “There’s clearly a perception issue.”

But Flint residents didn’t think it was a “perception issue.”

At city hall, residents like Claire McClinton demanded the city reverse course.

“I mean, what do we have to do to get them to turn the water back on to Detroit?” asked McClinton. “We survived bacteria. We’ve had boil water advisories as a result. They put too much chloride in the water, we’ve got trihalomethanes, and it’s just been one disaster after another.”

But Ambrose was blunt: The city was broke. It couldn’t afford to reconnect to Detroit, even if it wanted to.

A leaked report from the EPA

Through that spring of 2015 and into the summer, folks hauled their milk jugs full of discolored water to meetings.

They brought their hand-lettered signs down to city hall.

Good Samaritans handed out bottled water.

But the “Flint water crisis” hadn’t been coined as a phrase yet. Out-of-town reporters weren’t flocking to cover the rallies or tell the story, but then, in late June, something shifted.

In her little yellow house on the south side of Flint, Lee Anne Walters opened her laptop, and there, in her email, was a draft report from an EPA guy who had come to her house to check out her tap water.

She immediately forwarded the email to a reporter she had met in the spring. Curt Guyette is an investigative reporter who works for the ACLU of Michigan.

“You know, talking about the ‘hazardous waste levels’ of lead was certainly attention grabbing,” says Guyette.

The draft EPA report showed lead levels at Lee Anne Walters’ house were way worse than she thought.

We’re talking simply jaw-dropping numbers.

Let me put it this way: If you have a glass of water, and it has a lead level of 5,000 parts per billion, the EPA considers it hazardous waste. One sample from the Walters’ house had more than 13,000 parts per billion. And that’s not even the scary part. The scary part is this report said there was reason to believe that the Walters’ home could be a canary in the coal mine.

“It’s not this individual home. It’s not coming from inside the home. It’s coming from outside the home. We know now, from emails and other records, that, for months, the EPA had been warning state officials that something was wrong with Flint’s water,” says Guyette.

But you won’t hear from the guy who works for the EPA who wrote this report; the guy who was doing most of the warning. The EPA won’t make him available, but Guyette managed to get him on the phone before writing a blog post about the report.

“He wanted the information to get out,” says Guyette. “And he was willing to go outside normal EPA protocol in order to make sure that happened.”

This leaked report, this was the very first time any official had publicly said Flint’s water may not be safe.

But back then, the EPA report wasn’t finalized, so Guyette was lucky to have scored this one conversation with the author.

The EPA wasn’t talking to any reporters about it.

The state’s non-response response

So back in July, I turned to Brad Wurfel, the spokesman for Michigan’s Department of Environmental Quality. Wurfel agreed to talk to me about the EPA report. The first thing I asked him was: what responsibility does the state have in making sure lead isn’t getting into people’s drinking water?

“Let me start here,” Wurfel said. “Anyone who is concerned about lead in the drinking water in Flint can relax. There is no broad problem right now that we’ve seen with lead in the drinking water in Flint.”

It turns out, there was a broad problem, and it turns out, the MDEQ is exactly the agency responsible.

And we know now that the same week I talked to Brad Wurfel, was the same week some of the people he works with at the MDEQ realized that Flint’s latest lead tests weren’t looking too good.

The tests were bad enough that at that point, they should have informed the public about the broad lead risk, but that's not what happened. Instead, state and city officials kept telling residents there was no lead problem in Flint's water; that this EPA report was wrong; that the report was written by a "rogue employee."

About a month after the EPA's report was plastered all over the media, Lee Anne Walters went with a group of Flint residents and concerned pastors to Lansing. They were able to arrange a meeting with top officials at Michigan's Department of Environmental Quality.

Walters had hoped that, after she leaked the federal report, state officials would take their concerns more seriously.

"They blew us off like we didn't know what we were talking about," says Walters.

State officials told Walters and others that the EPA employee who gave her the report had been "handled," but Walters had met someone who did take her seriously.

Help for people in Flint, Michigan comes from a professor in Blacksburg, Virginia

Later that afternoon, after that unproductive meeting with state regulators, she made a phone call that helped change the course of Flint's water crisis.

Marc Edwards is an environmental engineer, and a professor at Virginia Tech. He's studied the corrosion of old water systems for decades. Edwards has tested probably 30,000 homes for lead in his career. He's never seen anyone with higher lead levels than Lee Anne Walters' home in Flint.

On that warm, Tuesday afternoon in August, when Walters called Edwards to tell him how awful that meeting with the state went, Edwards remembers hanging up the phone and physically shaking with anger.

“I mean this is an imminent and substantial endangerment to children, and for me sitting 15 hours away, I can't believe how people could just sit there and let other children drink that water,” says Edwards.

“I mean, how could you do that?”

Edwards couldn’t sleep. He decided he had to drop everything.

He got four grad students together, and a bunch of lead test kits. Two days later, they loaded up in Edwards’ 13-year-old white “soccer mom” mini-van and drove 15 hours straight – directly to Flint.

By mid-August, the small research lab on the 4th floor of Durham Hall at Virginia Tech was a beehive of activity. Cardboard FedEx boxes full of lead testing kits from Flint started arriving for analysis.

Lee Anne Walters, and a group of Flint residents helped hand out the testing kits all over Flint. In all, graduate students, like Anurag Mantha processed more than 800 samples.

“We spent so many weekends here trying to get that done on time, so that we could get the data and start giving out the results to people because every hour, every day, we're delayed that thing, more and more people were still drinking the Flint water,” she says.

The tests showed lead levels in Flint were pretty bad.

Alerting the people of Flint

Bad enough, that one afternoon in mid-September, he went back to Flint. On the lawn in front of Flint City Hall, Edwards addressed several reporters, and about two dozen Flint residents.

Point by point, he explained why there's a dangerous lead problem in Flint.

"This problem has arisen because of what's known as a corrosion issue. So most cities, like Detroit, have treatments for their water where they put chemicals in the water to stop corrosion," he said to the crowd. "You can't see it, but there's an iron nail in this bottle here."

He held up two small bottles of water. In one with pretty clear water, you can see a small nail in the top. The water in the other bottle is orange. This was Flint's water. It was basically eating the nail. The iron nail was disintegrating into the water.

Edwards says Flint's corrosive water is doing the same thing to distribution pipes all over the city.

"Flint is the only city in America that I'm aware who does not have a corrosion control plan in place to stop this kind of problem," Edwards said. "So this water looks bad. It smells bad. It tastes bad. And this is part of what people have been complaining about."

But, Edwards warned the crowd, the real danger isn't the iron you can see in the tap water. The real danger is odorless, tasteless lead, that's also leaching from the distribution system.

Edwards said people in Flint should protect themselves against the lead exposure immediately.

He told them to stop drinking the tap water; to buy a certified lead filter, or bottled water if they can afford it.

Tomorrow, learn how state officials continued to downplay the lead risk to Flint's children, even after experts found dangerously high levels of lead in the water. And we meet a Flint pediatrician who risked her reputation to change the city's course. That's on the third and final installment of Not Safe To Drink, a special documentary from Michigan Radio.

In Flint, Mich., there's so much lead in children's blood that a state of emergency is declared

By Yanan Wang December 15 at 4:31 AM

Flint, Mich., resident Gladyes Williamson cries out through her tears, overwhelmed with frustration over the water drawn from the Flint River. (Jake May /Flint Journal-MLive.com via AP)

For months, worried parents in Flint, Mich., arrived at their pediatricians' offices in droves. Holding a toddler by the hand or an infant in their arms, they all have the same question: Are their children being poisoned?

To find out, all it takes is a prick of the finger, a small letting of blood. If tests come back positive, the potentially severe consequences are far more difficult to discern.

That's how lead works. It leaves its mark quietly, with a virtually invisible trail. But years later, when a child shows signs of a learning disability or behavioral issues, lead's prior presence in the bloodstream suddenly becomes inescapable.

According to the World Health Organization, "lead affects children's brain development resulting in reduced intelligence quotient (IQ), behavioral changes such as shortening of attention span and increased antisocial behavior, and reduced educational attainment. Lead exposure also causes anemia, hypertension, renal impairment, immunotoxicity and toxicity to the reproductive organs. The neurological and behavioral effects of lead are believed to be irreversible."

The Hurley Medical Center, in Flint, released a study in September that confirmed what many Flint parents had feared for over a year: The proportion of infants and children with above-average levels of lead in their blood has nearly doubled since the city switched from the Detroit water system to using the Flint River as its water source, in 2014.

The crisis reached a nadir Monday night, when Flint Mayor Karen Weaver declared a state of emergency.

"The City of Flint has experienced a Manmade disaster," Weaver said in a declaratory statement.

The mayor — elected after her predecessor, Dayne Walling, experienced fallout from his administration's handling of the water problems — said in the statement that she was seeking support from the federal government to deal with the “irreversible” effects of lead exposure on the city’s children. Weaver thinks that these health consequences will lead to a greater need for special education and mental health services, as well as developments in the juvenile justice system.

“Do we meet the criteria [for a disaster area]? I don’t know,” she told Michigan Live. But Weaver doesn’t think the city can receive the help it needs without alerting federal officials to the urgency of the matter.

To those living in Flint, the announcement may feel as if it has been a long time coming.

Almost immediately after the city started drawing from the Flint River in April 2014, residents began complaining about the water, which they said was cloudy in appearance and emitted a foul odor.

Since then, complications from the water coming from the Flint River have only piled up. Although city and state officials initially denied that the water was unsafe, the state issued a notice informing Flint residents that their water contained unlawful levels of trihalomethanes, a chlorine byproduct linked to cancer and other diseases.

Protesters marched to City Hall in the fierce Michigan cold, calling for officials to reconnect Flint’s water to the Detroit system. The use of the Flint River was supposed to be temporary, set to end in 2016 after a pipeline to Lake Huron’s Karegnondi Water Authority is finished.

A petition lobbying for the ending the city’s Flint River water supply garnered 26,000 signatures.

Through continued demonstrations by Flint residents and mounting scientific evidence of the water’s toxins, city and state officials offered various solutions — from asking residents to boil their water to providing them with water filters — in an attempt to work around the need to reconnect to the Detroit system.

That call was finally made by Gov. Rick Snyder (R) on Oct. 8. He announced that he had a plan for coming up with the $12 million to switch Flint back to the Detroit system. On Oct. 16, water started flowing again from Detroit to Flint.

This, too, was accompanied by the sense that it had come too late, particularly for the parents of children who may have been permanently affected.

These parents and other Flint residents filed a class-action federal lawsuit against Snyder, the state, the city and 13 other public officials in November for the damages they have suffered as a result of the lead-tainted water. The suit, which claims to represent “tens of thousands of residents,” alleges that the city and state officials “deliberately deprived” them of their 14th Amendment rights by replacing formerly safe drinking water with a cheaper alternative that was known to be highly toxic.

“For more than 18 months, state and local government officials ignored irrefutable evidence that the water pumped from the Flint River exposed [residents] to extreme toxicity,” the complaint reads. “The deliberately false denials about the safety of the Flint River water was as deadly as it was arrogant.”

Calling officials’ conduct “so egregious and so outrageous that it shocks the conscience,” the complaint cites the specific experiences of a few plaintiffs and their families, all of whom allege they have been challenged by similar health ailments since high levels of lead and copper entered their bloodstreams.

These conditions include skin lesions, hair loss, chemical-induced hypertension, vision loss and depression. Of the four families described in the complaint, two had ceased to drink Flint water after a certain point — and used it only for washing and cooking — but still said they were exposed to many of the same ill effects.

As the Detroit Free Press reported in October, avoiding Flint water became a way of life for the city’s residents.

Those who could afford it opted for bottled water, buying it by the gallons. Those who couldn’t spare the money drank it straight from the tap all the same, knowing that they would be paying for it later. When it came to bathing, some slowly filled bathtubs with pots of boiled water for their children.

LeeAnn Walters, a Flint resident and mother of 4-year-old twins, took every precaution after blood tests revealed that the level of lead in one of her sons had soared after the switch to Flint

River.

“I was hysterical,” Walters told the Free Press. “I cried when they gave me my first lead report.”

She had feared lead was the problem when her whole family developed rashes and her son stopped gaining weight.

Now, Walters said, when her children experience problems as they grow up, she will always wonder whether things would have been different — if their lives would have been better — if it weren’t for the water.

Mayor Karen Weaver declares water crisis state of emergency in Flint

By Ron Fonger | rfonger1@mlive.com The Flint Journal on December 14, 2015 at 9:37 PM, updated December 15, 2015 at 7:39 AM

FLINT, MI -- Mayor Karen Weaver has declared a state of emergency in Flint, saying the city needs federal help to deal with its lead in water crisis.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told the City Council today, Dec. 14.

The new mayor asked that the Genesee County Board of Commissioners call a special meeting to take action to support her declaration, that it be forwarded to Gov. Rick Snyder, and potentially President Obama.

The end result of the resolution is not known, but Weaver said the city can't expect further help from the federal government without it.

"Do we meet the criteria (for a disaster area)? I don't know," Weaver said. "I'm going to ask and let them tell us no."

Flint is in a public health emergency, declared by Genesee County, because of rising levels of lead in water and in the blood of children after the city changed its water source to the Flint River from April 2014 until October.

The county declaration came after a Hurley Medical Center doctor's study showed the percentage of Flint infants and children with above-average lead levels nearly doubled citywide, and nearly tripled among children in "high risk" areas of lead exposure.

City officials have also said the use of corrosive Flint River water also damaged Flint's water infrastructure after state regulators never required the river water be treated to make it less corrosive.

Council members were divided in their opinion about what the declaration will mean.

"What this does is help position us as a community to show ... that we need resources in our community," said Councilman Scott Kincaid. "(It allows for us) to apply for state and federal funds. We have to prove ... that we need resources."

Councilman Josh Freeman said he doesn't want residents to expect immediate help with the city's water infrastructure, including lead service lines, because of the declaration.

"We need to find a way to actually fix the problem," Freeman said. "This declaration does not (fix the problem)."

Weaver's resolution says the damage done to Flint children because of lead exposure is irreversible, creating the need for increased spending on special education and mental health services and increased stress on the juvenile justice system.

This mom helped uncover what was really going on with ...

This mom helped uncover what was really going on with Flint's water (part one of the Michigan Radio documentary Not Safe to Drink)

Lindsey Smith, Michigan Radio • 17 hours ago

Up until October, the Walters family lived in a yellow two-story home on the south side of Flint. A couple of red maple trees shade the tiny front yard.

Walters heads to the back of the house, in a small room off of the kitchen, where the family keeps its stockpile of bottled water.

"This is our water stash. Once a week we go and we fill 40 gallons of water, so we have water to drink with, to cook with, and to bathe Gavin and Garrett in," says Lee Anne Walters.

Walters won't let her kids drink any water from her faucet. She won't even let her four-year-old boys, Gavin and Garrett, bathe in anything but bottled water, so preparing for bath time is quite the chore.

Walters takes jugs of water she buys at the store, dumps them in large pots, and heats the water on her stove. Once it boils, she dumps the water in the bathtub. Then she adds three or four gallons of cool water to sort of get the bath at the right temperature.

Over several months, Walters says she's gotten pretty efficient at this routine. She's got bath prep down to about 45 minutes.

“And then in between, because we only do the bathing thing once a week now – because, one, it's expensive, and two, the expense of all this on top of the water bills? We do baby wipe baths in between,” says Walters.

Walters scrubs the boys down with baby wipes almost every day. Luckily, her husband can shower at work. Her two oldest kids – they're teenagers – usually shower over at grandma's house outside of town.

There's a lot of people in Flint who knew something was wrong with the water, but this family's story, particularly Walters' role as a worried mother, changed everything about how the water crisis in Flint was handled.

Something's in the swimming pool

People in Flint started complaining about their tap water early in the summer of 2014 – not long after the city stopped pumping its drinking water from Detroit.

Instead, Flint started pumping it from the Flint River. Back then, Lee Anne Walters didn't think it was that big of a deal.

They had just bought their house. Someone had stripped all the plumbing from it, so they had to redo the house with new plumbing, and they installed a whole house filter.

Every drop of water that comes into her home goes through this filter.

But a few weeks after the city's switch to water from the Flint River, Walters noticed something was weird.

She had just set up the swimming pool in the side yard for the summer.

"Gavin started breaking out every time he'd get in the pool," says Walters.

The rash was bad enough that Walters took him to the doctor.

"And the doctors kept telling us it was contact dermatitis." She says they told her that "he's coming into contact with something that he's allergic to."

Later, Walters says her doctors suggested it was eczema. They gave her a cortisone cream to rub on Gavin's rash, but by July 2014, it wasn't just Gavin. His twin brother Garrett got the rash too.

"And we took them in and they told us it was scabies, so we treated them with a pesticide," says Walters.

Tiny mites cause scabies, and the common treatment is a chemical that's also in some pesticides. It's even in some mosquito nets and flea collars.

Walters rubbed the prescription cream on her twin boys from the neck down.

"I spent a ton of money because all the laundry that we had, all the bedding that we had, we took it to a laundromat," she says.

Walters was relieved when the boys' rash went away, but that feeling didn't last long.

Walters remembers the day the rash came back, because she had a bunch of people over to celebrate her daughter's high school graduation.

"And all the people that were here swimming and drinking the water, all of them broke out," she says.

She scheduled another doctor's appointment for her four-year-olds. She got the same diagnosis, but Walters really had some doubts about the scabies diagnosis, especially after the party.

"The third time they tried to convince us that it was scabies, I said, 'nun-uh, no.' The cream wasn't working on Gavin - period. He had that rash for more than a month straight."

Walters wasn't standing for it anymore, so she took Gavin to a dermatologist down in Brighton. They scraped in between Gavin's little toes, and put it under the microscope.

"And she verified by doing the skin scrapes that there was no scabies. There was no live anything – no dead anything – no eggs, so no scabies," she says.

She still didn't know what caused the rash, but Walters noticed something. Gavin's rash flared up every time he swam in the pool, and every time he took a bath.

Something clicked.

It became clear to her right then that Gavin's rash was caused by something in the tap water.

The city of Flint learns about Walters' problem

Eight months after Flint started pumping its drinking water from the Flint River, Lee Anne Walters stopped letting her kids drink it – everyone from the four-year-old twins, Garrett and Gavin – to her teenagers, JD and Kaylie.

“We quit drinking the water in December, when my 14-year-old got sick and it started coming through our filter and out the kitchen sink brown,” she says.

That was December 2014.

Walters says the water had this orangeish-brown tinge that would not go away, even when she put a fresh cartridge in the water filter, and at this point she was putting a fresh cartridge in the water filter at least a couple times a month.

Back when Flint was buying Detroit water, she only replaced it a couple times a year, so she called the city out to come take a look.

The city sent Mike Glasgow, Flint’s Utilities Administrator. He’s a Flint native and he’s spent the bulk of his career working for the city.

“I remember this fairly well,” says Glasgow. “A complaint had come through from her about discolored water – orange water.”

Glasgow says complaints like Walters’ were common around this time, but there’s a reason this one stood out.

“After the first day there, I said, ‘well, there’s a few ways we go about cleaning this up. We can flush hydrants. I’ll have people from our service center get out and check the area – see if anything’s out of the ordinary. I’ll be back a week later as a follow-up and usually we can clear something up in that amount of time,’” he said.

A week later, Glasgow went back to Walters’ house. Her tap water looked exactly the same. It still had this orange tinge.

“And I just happened to have some lead and copper sample bottles with me, and since her water was still discolored, I started to worry more about corrosion," he says.

People like Glasgow, those who help operate water plants in older cities like Flint, they worry about corrosion.

It can be a sign that a city isn't treating its water properly.

Water that's treated correctly – that has the right chemical balance – it will actually coat the inside of old pipes. That coating helps keep metals, like lead, copper, and iron from showing up in people's tap water.

An urgent voicemail. A mother's panic.

Glasgow ran a test on Walters' water.

"About a week later I got the results and it was pretty high for lead, so I called her right away to let her know," say Glasgow.

The results were alarming enough that Glasgow called Walters right away, but he couldn't reach her that afternoon.

He left her a voicemail.

Walters vividly remembers the message.

She recounted it for me:

"Hi Lee Anne, it's Mike from the Water Department. I just wanted to call and let you know we got your test back. Please, whatever you do, don't let your kids drink the water. Don't make their juice with it. And please just give me a phone call back as soon as possible.”

Walters tossed and turned all night, worrying.

How bad could the water be?

By the time Walters did get ahold of Mike Glasgow the next day, she was kind of panicked.

“He's like, ‘your number's at 104,’ and I'm like, ‘OK, well what is it supposed to be?’ He's like, ‘not over 15.’ And I’m like, ‘wait, what?’”

I just want to make sure you really get these numbers they’re talking about. I mean, there’s no level of lead exposure that is considered safe, but any amount of lead in water above 15 parts per billion is a problem.

At that level, cities are supposed to at least warn you about how bad your lead levels are.

The lead level in the water at the Walters’ place was seven times higher than that.

But at that moment, hearing that number – 104 parts per billion – Walters remembers she didn’t know what to make of it.

“OK, what does this mean? He's like, ‘we don't know. We’ve never seen a number like this before in the city.’ He’s like, ‘it’s the highest anyone’s ever seen.’”

Glasgow was adamant no one drink the water. Don’t use it to cook with. Don’t brush your teeth with it. If you’re going to take a shower, wash dishes, or even do a load of laundry, let the water run for 10 or 15 minutes first.

Flushing beforehand helps lower lead levels, he said.

A week later, Glasgow came back to do a follow-up test.

“And that one came back at 397, and it was like, ‘whoa. OK. Well, here's an even higher number. What the hell?’ And then it was, ‘OK, well now you've got to start flushing your water for 25 minutes before you use it for anything,” says Glasgow.

After that test, Glasgow decided to keep a close eye on the water at the Walters’ place. He came out almost every week.

“And they were seeing it consistently brown every week,” says Walters. “They didn’t have any answers for me.”

You can see iron in water.

It’s what gave Walters’ tap water that awful orange tinge, but you can’t see the lead in water. It’s odorless, tasteless, and much more dangerous to your health.

With numbers like that, Lee Anne Walters did what probably any mother would do. She took her kids to the doctor to get tested for lead.

When the tests came back, the diagnosis wasn’t good for Gavin. The doctors said he had lead poisoning.

“After the fact, knowing I was giving this to my kids makes me sick, because we should be able to trust the fact that we’re paying for this service,” she says. “And we should be able to trust the fact that it’s not going to harm our kids.”

Tomorrow, in part two of our series, we’ll hear how Lee Anne Walters contacts the EPA, and red flags start to go up. Mike Glasgow’s fear about corrosion turns out to be well founded.

Flint Mayor Declares State of Emergency Over Water Problems

By THE ASSOCIATED PRESS

FLINT, Mich. — Dec 15, 2015, 7:54 AM ET

Flint's mayor has declared a state of emergency due to problems with the city's water system caused by using water from the Flint River, saying the city needs more federal help.

Karen Weaver announced the declaration Monday night and said the move intends to help raise awareness of continuing problems. She said damage to children caused by lead exposure is irreversible and that the city will need to spend more on special education and mental health services as a result.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told City Council.

Exposure to lead can cause behavior problems and learning disabilities in young children.

Genesee County earlier declared a public health emergency. Officials have told Flint residents not to drink unfiltered tap water.

Flint switched from Detroit's water system last year to Flint River water in a cost-cutting move while under state emergency financial management. The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

But residents complained about the taste, smell and appearance of the water. Officials maintained the water met safety standards, but children were found to have elevated levels of lead in their blood and it was determined that corrosive river water was drawing lead from aging pipes.

Flint returned to Detroit's system in October.

Weaver was elected in November, unseating the incumbent mayor who led the city during the public health emergency and blamed state and federal agencies for the city's water problems. Weaver had promised while campaigning to issue an emergency declaration.

City Council members were divided about what the declaration will mean, The Flint Journal reported. Councilman Scott Kincaid said it's needed to seek more aid, noting that "We have to prove ... that we need resources."

Councilman Josh Freeman said he doesn't want residents to expect immediate help with the city's water infrastructure, including lead service lines, because of the declaration. He said the declaration doesn't fix the problem.

"We need to find a way to actually fix the problem," Freeman said.

FEMA sends 28,000 liters of bottled water to Flint amid lead troubles

By Ron Fonger | rfonger1@mlive.com on December 14, 2015 at 4:24 PM, updated December 14, 2015 at 8:50 PM

FLINT, MI — The federal government is helping to replenish the bottled water supply in Flint.

Two trucks delivered about 28,000 liters of water from the Federal Emergency Management Agency to the Food Bank of Eastern Michigan on Monday, Dec. 14. The water will be donated to "partner agencies" in the city of Flint that will distribute the water to residents.

"I don't think any (previous water donations) have been quite this large," said Kelly Belcher, marketing manager for the Food Bank.

Cassie Ringsdorf, a FEMA spokeswoman, said the agency maintains commodity stockpiles at warehouses across the country and makes them available.

"These commodities are available for use, within hours, should an incident occur that requires support from FEMA," Ringsdorf said in an email to The Flint Journal.

"As a part of our normal commodities management process, FEMA periodically offers commodities nearing the end of their shelf-life to eligible non-profits for donation. These donations are not done, 'on-request,' but are a part of our normal strategy to maintain our stockpiles for use in emergencies," the statement said.

A news release from the Food Bank credited Michigan State Police Lt. Billie Jo Roach with having identified the availability of the water from FEMA.

Flint remains in a public health emergency, and officials have said residents should not drink unfiltered tap water because of rising lead levels while the city used the Flint River as its water source from April 2014 until October 2015.

Earlier this month, Virginia Tech professor Marc Edwards said even though the city no longer uses the river as a water source, water remains unsafe to drink unfiltered in some areas of the city.

Roach is the MSP Emergency Management and Homeland Security Division District 3 coordinator.

The Journal could not immediately reach a representative of the MSP Emergency Management and Homeland Security Division for further comment.

FEMA said the Food Bank claimed two truckloads of water and agreed to pay all transportation costs associated with the donation.

Belcher said the United Way of Genesee County paid that expense for the Food Bank.

The Food Bank's partner agencies that will receive the FEMA water include soup kitchens, homeless shelters and food pantries, the organization said in its news release.

In trying to solve one water crisis, the city of Flint, Michigan, has inadvertently created a newer, even bigger one — and it's coming at the cost of children's health.

Now, after tests have shown elevated lead levels in the blood of some local children, the mayor of Flint has declared a state of emergency to pave the way for possible government disaster aid.

"I can tell you today that we need state and federal assistance for the people to feel comfortable. We need some help," Flint Mayor Karen Weaver said during a Tuesday afternoon news conference, after first announcing the disaster declaration Monday.

"There's no question in my mind that Flint is not able to take on this challenge by ourselves," she added as residents in attendance broke out in applause.

Weaver was elected in November, running on the promise that she would declare the state of emergency in the city of 99,700.

She said damage to children caused by lead exposure is irreversible, and that the city will need to spend more on special education and mental health services as a result.

Exposure to lead can cause behavior problems and learning disabilities in young children, health officials warn.

Genesee County, where Flint is located, earlier declared a public health emergency. Officials have told Flint residents not to drink unfiltered tap water.

Flint's water woes are only the latest for a community that saw its financial fortunes sink with the downturn of the American auto industry.

Flint switched from Detroit's water system last year to the Flint River as part of a cost-cutting move while under the state's emergency financial management. Officials had estimated the cash-strapped city would save about $5 million in less than two years because of the change.

Tapping from the Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

But residents complained about the taste, smell and appearance of the water. Officials maintained the water met safety standards, but children were later found to have elevated lead levels in their blood and it was determined that corrosive river water was drawing lead from aging underground pipes.

Flint, Michigan, residents protest the water quality in the city on Oct. 5, 2015, outside Flint City Hall. Danny Miller / AP

Flint returned to Detroit's system in October, but the damage was apparently done.

"So far, what we've had is Band-Aid fixes. We have the filter program, we have talked about diets for lead exposure, and don't get me wrong, we want these things to continue," Weaver said at a City Council meeting Monday night, according to NBC affiliate WEYI. "We need all of that, but it's not enough."

Residents flooded City Hall in protest this year saying their children were being poisoned; water filters and bottled water were handed out as part of a government response.

Flint mom Lee Anne Walters told NBC News in October that the tap water was to blame for her son, Garrett, seeing his lead levels triple.

"I'm all for doing what's in the best interest of our city," Walters said about the initial move to switch water systems. "But if you're going to do this, you better make sure it's safe — and they didn't."

Ron Leix, a spokesman for the state Emergency Management and Homeland Security Division, said county commissioners would need to support Flint's disaster declaration in order for financial aid to be considered.

And that could take time.

"It's not like FEMA will come here on a magic carpet," Leix told NBC News on Tuesday. "It can be a lengthy process."

Already, county officials have signaled they may not back Weaver's request. Genesee County board Chairman Jamie Curtis said he has no plans to call a special meeting to vote on supporting the disaster aid, reported MLive.com

A call to the county Board of Commissioners went unanswered Tuesday afternoon.

Leix, meanwhile, said it's unclear how much money Flint would be able to collect in government aid even if the process does move forward. "We haven't seen the damage assessment," he added.

Flint, Michigan, tried to save money on water. Now its children have lead poisoning (Vox.com)

http://www.vox.com/2015/12/15/10237054/flint-lead-poisoning

Updated by Libby Nelson on December 15, 2015, 7:00 p.m. ET @libbyanelson
libby@vox.com

The water in Flint, Michigan, poisoned the town's children with lead for months. Now the mayor of Flint has declared a state of emergency, saying that the elevated lead levels will have long-lasting effects in its children.

Four percent of the town's children have elevated levels of lead in their bloodstream — double the share affected a few years ago, according to tests from Flint's Hurley Medical Center and confirmed by the state.

This all came about because a struggling Rust Belt city, trying to save money, ended up failing at one of its most basic tasks, providing safe drinking water. And the city compounded the problem by ignoring months of warnings from activists who felt its water was not safe to drink.

Flint's decision, and the state's insufficient water testing, led to irreparable damage. There's no amount of lead safe for children to drink, and the effects of lead poisoning last a lifetime.

How Flint poisoned its children while trying to avoid bankruptcy

Although the state of emergency wasn't declared until today, the lead crisis in Flint has been public since October, and suspected long before that.

But things were bad in the Michigan city long before its tap water turned out to be unsafe.

Flint was once a prosperous manufacturing town, but it never recovered from the closure of General Motors plants in the late 20th century. By 2013, when the water saga started, Flint's population had dropped from 200,000 in the city's heydey in the 1960s and 1970s to about 99,000 today. Its landscape was dotted with abandoned homes. The unemployment rate was 16 percent. Forty-two percent of residents, including two-thirds of children, were living in poverty — a higher share than in even Detroit, which had become a symbol of post-recession urban blight.

Flint was also going broke. It had lost 75 percent of its property tax base since the 1980s. An emergency manager had been running the town's finances since 2011. The city was overloaded with $1.1 billion in unfunded pension costs.

And there wasn't much left to cut: Budget cuts had already slashed its police force, cutting the total number of officers from 265 officers in 2007 to 122 in 2012. In 2013, it was named the most dangerous city in America.

So Flint decided to save money on water. It had been purchasing water from Detroit, but costs had been climbing even as Flint's population fell. In 2013, the city decided to join a new, regional water system that, like Detroit, drew water from Lake Huron. The switch would save millions of dollars per year.

The problem was that the regional water system wasn't yet built, and Flint wanted to start getting its water from somewhere other than Detroit right away. So the city started taking its water directly from the Flint River in 2014 — celebrating its break from Detroit with a countdown and a toast, Michigan Radio reported.

Residents started complaining about the water's smell and taste almost immediately, saying it caused rashes, hair loss, and other health problems. A nearby General Motors plant said the water was damaging its car parts and quit using it. At one point, residents had to boil water due to bacteria.

But the city assured them that everything was fine, and that the bad smell and taste don't necessarily indicate other problems. They claimed federal tests showed the water was safe.

Flint officials took a very long time to admit they had a lead problem

Even as other problems with Flint's water were uncovered — bacterial contamination, as well as high levels of other contaminants that can cause liver problems — the lead poisoning remained hidden.

In late June, an employee at the U.S. Environmental Protection Agency's Chicago office leaked a report on Flint's water to a local activist, whose son had developed a rash after swimming in a pool filled with Flint water and was diagnosed with lead poisoning. It said tests found high lead levels in the water. The city had told the woman the lead came from her plumbing, not the water.

But Flint continued to deny it, saying the report was released prematurely by a "rogue employee." Flint's lead problem wasn't made public until early fall, after outside researchers from Virginia Tech got involved and found extremely high levels of lead in the water of some Flint homes — and elevated levels in 40 percent of the homes the researchers tested.

In September, pediatricians reported that when the city bought water from Detroit, 2.5 percent of children under 5 in the most affected zip codes had elevated levels of lead in their blood. After the switch, that share had more than doubled, to 6.3 percent.

In the city as a whole, the proportion of children with high blood lead levels doubled, from 2.1 percent to 4 percent.

The city finally admitted it had a serious problem. In October, Flint began handing out water filters and began buying water from Detroit again, at a cost of $12 million.

The state Department of Environmental Quality admitted it had making a mistake in testing Flint's water for lead and other contaminants. "The water testing steps followed would have been correct for a city less than 50,000 people, but not for a city of nearly 100,000," Dan Wyant, the department's director, said in a statement.

Lead poisoning lasts a lifetime

Lead poisoning affects brain development so much that the gradual reduction of lead poisoning in American society has worked something of a miracle. Exposure to lead, and no amount of exposure is now considered safe, can lead to learning disabilities, lower IQs, and impulsivity. Those effects, multiplied over a city or state or country, are costly.

Eliminating lead in gasoline, Mother Jones's Kevin Drum argued in 2013, might be responsible for the dramatic drop in crime in the US in the 1990s:

If you add a lag time of 23 years, lead emissions from automobiles explain 90 percent of the variation in violent crime in America. Toddlers who ingested high levels of lead in the '40s and '50s really were more likely to become violent criminals in the '60s, '70s, and '80s.

But lead poisoning is still around, particularly in poor neighborhoods, where it's more likely to linger in paint on the walls of older houses. Freddie Gray, whose death in police custody led to protests in Baltimore last year, grew up around lead paint chips. Gray, like other Baltimore residents, won a settlement in 2010 from the landlords who allowed those conditions to persist.

In Flint, attorneys are recruiting plaintiffs for a class action lawsuit against the city and state. It's likely to be a long process, but the damages from the city's brief stint of filtering its own water will last years.

Go deeper:

Kevin Drum's Mother Jones article on how lead poisoning caused the rise and fall of crime in the US is a testament to just how bad the condition can be.

Michigan Radio is in the middle of publishing a multi-part documentary on Flint's water crisis that lays out the story in fascinating, horrifying detail.

Another horrifying lead paint scandal: an experiment in Baltimore in the early 1990s deliberately exposed children to lead in order to test the effectiveness of lead removal techniques.

Flint, Michigan, Declares State of Emergency Over Amount of Lead in Drinking Water (Slate.com)

http://www.slate.com/blogs/the_slatest/2015/12/15/flint_declares

By Ben Mathis-Lilley

Downtown Flint in a photo from 2009.

Photo by Rebecca Cook/Reuters

The mayor of Flint, Michigan, has declared that **the level of lead in the city's drinking water constitutes a state of emergency**, the *Washington Post* writes Tuesday. The city began using the Flint River as its water source in 2014, and a**September study** found that the number of infants and children with above-average levels of lead in their blood has since nearly doubled:

Screenshot/Flint Water Study

Mayor Karen Weaver says that the potential impact of **lead poisoning** on the physical and mental health of Flint children will require federal resources that can only be accessed by making the emergency declaration. (Lead has particularly damaging effects on children.) The city previously **declared a "public health emergency"** in October.

The city of Flint was for many decades a center of manufacturing operations for General

Motors and related companies; a 2003 study called the automotive industry the **"leading remaining source of lead pollution" in North America**.

A State of Emergency Over Water in Flint (The Atlantic)

http://www.theatlantic.com/national/archive/2015/12/flint-michigan-lead-water-toxic/420654/

Citing toxic levels of lead in the drinking water, the mayor of the Michigan town said "irreversible" damage is being done to children in the area.

Michigan's Flint River Wikimedia

ADAM CHANDLER DEC 15, 2015 U.S.

The mayor of Flint, Michigan, has declared a state of emergency over the city's drinking water, which she says has caused "irreversible" damage to the health of the children consuming it.

"This action is being taken to protect the health, safety, and welfare of the citizens of Flint," wrote Karen Weaver in the declaration Monday night.

Over the past year, residents have increasingly complained of health issues, and doctors have detected high iron levels in patients' blood. Last April, the city switched from Detroit's water system to the use of the local Flint River in an effort to save money during a financial crisis.

“The Flint River was supposed to be an interim source until the city could join a new system getting water from Lake Huron,” the AP noted. Officials have since urged residents not to drink unfiltered tap water.

In a dispatch from Flint earlier this year, my colleague Alana Samuels outlined the problem, including how the city’s diminishing population impacts its ability to improve its aging infrastructure.

Like many cities in America, Flint has lost residents but still has to provide services like water and sewer and road maintenance within the same boundaries. All while bringing in less tax revenue to pay for it. Flint has not had the money to spend on crucial infrastructure upgrades, and has left old pipes in place for longer than most engineers would recommend. Water prices are rising in Flint, like they are in lots of other cities, but the quality of water is getting worse, not better.

Weaver, elected last month, had campaigned on a promise of declaring an emergency if conditions didn’t change. And while it’s not clear what concrete changes the declaration will inspire, some residents were happy to see some action being taken.

“I’m thrilled,” wrote Melissa Mays, a resident of Flint, in an email on Tuesday. “It’s what we’ve been pushing for since we found out how badly our infrastructure was damaged. It’s definitely a step in the right direction.”

Michigan mom feels "helpless" amid tainted water crisis (CBS News)

http://www.cbsnews.com/news/flint-michigan-drinking-water-lead-contamination-lawsuit-mays-family-impact/

Flint, Michigan, is in a state of emergency, now months after high levels of lead turned up in its tap water. This week, more than 7,000 gallons of bottled water from FEMA arrived in the city.

When officials tapped into the Flint River for the city's drinking water, the strong chemicals used to clean the water caused lead from the pipes to leak into the supply, reports CBS News correspondent Adriana Diaz. By the time Flint went back to its original water source, families said the damage was already done.

"When I hear my son get up at night and cry because his bones hurt and there's nothing I can give him, there's nothing I can do for him to take away his pain,I feel completely helpless," Melisa Mays said.

For nearly five months, Mays and her family drank the water from their tap, unaware there was lead in it. Mays said she noticed a change in her three children: convulsions, skin lesions, memory and hair loss.

"My heart breaks, because fact of the matter is, I handed them the glasses of water," Mays said.

Last month, Mays and other Flint residents filed a civil lawsuit.

In court papers, they accused state and local officials of "not properly monitoring or sampling the Flint River water" and delaying "in notifying the public of serious safety and health risks." They went on to call the city's "deliberately false denials" about the safety of the water "deadly" and "arrogant."

"They continually said the water is safe to drink," Rhonda Kelso said.

The city's water problems started in the spring of 2014, when Flint moved its water supply from a source in Detroit to the Flint River. The switch was supposed to save the city about $15 million a year.

But the lead levels detected in Flint's children under the age of five nearly doubled, according to a study by a local medical center.

In October, city officials declared unfiltered water unsafe to drink. Shortly after, Flint switched back to the original Detroit water supply.

"Damage from lead is irreversible," Flint's new Mayor Karen Weaver said.

Weaver said the city needs to fix its decaying infrastructure.

"When we made that switch to the Flint water, we damaged the pipes. We already had very old infrastructure but there was no corrosion control in place," she said.

The World Health Organization declares any level of lead in the body unsafe and is particularly toxic to young children. Severe cases of exposure may cause mental disabilities and behavioral difficulties with irreversible neurological effects.

"I can make nightmares go away, I can make spiders go away. I can't fix this and I can't make this go away," Mays said.

Flint's mayor told CBS News that upgrading the city's infrastructure could cost $1 billion, but she hopes declaring a state of emergency will unlock additional state and federal funding. Gov. Rick Snyder has created a task force to review Flint's water crisis.

Flint mayor declares 'manmade disaster' over lead-tainted water supply (The Guardian)

http://www.theguardian.com/us-news/2015/dec/15/michigan-mayor-declares-manmade-disaster-lead-tainted-water-supply

The Michigan city has declared a state of emergency over contaminated water, affecting the entire city of 100,000 residents and those who commute there

Employees at the Flint, Michigan General Motors plant, which stopped using Flint water because it was rusting the machinery. Photograph: Jake May/AP

Joanna Walters in New York
@Joannawalters13

Tuesday 15 December 2015 17.45 ESTLast modified on Tuesday 15 December 201518.04 EST

The city of Flint, Michigan, has declared a state of emergency over contaminated water supplies amid calls for a criminal investigation, the resignation of the state governor and a class action lawsuit that could top $1bn.

The Federal Emergency Management Agency (Fema) sent 28,000 bottles of water to the city on Monday just hours before the mayor declared: “The city of Flint has experienced a manmade disaster.”

Critics believe the entire city has been affected to varying degrees by high levels of lead and other pollutants in the water. This includes the 100,000 residents and those who commute to Flint for work.

At a city council meeting on Monday night, Mayor Karen Weaver said Flint needed federal help to deal with a crisis over water supplies tainted with lead.

The Flint authorities had switched the public water supply in April 2014 from Lake Huron to the Flint river. The river flows through the city but had not been used for consumption since the early 1960s because of industrial pollution.

After the switch, many residents immediately reported that the water coming out of their taps was yellowy, cloudy and odorous.People reported suddenly breaking out in rashes or losing their hair.

Public protests followed, but the authorities repeatedly said the water was safe, despite stepping up water treatment and occasionally issuing advice to residents to boil it.

But in October 2015, the city returned to its previous supplier, the city of Detroit, which treats water from Lake Huron then passes it on to Flint, 66 miles to the north-west.

Comments:

"Because of similarities in source water and in treatment processes with Detroit's Huron plant, the Flint water plant will likely produce treated water with quality substantially similar to that of the water currently being received from Detroit."- Although we hope this will be accurate if that is the intent, I can't tell how likely that will be. Also, just because processes (and source water) are the same, they can be operated totally differently and produce totally different finished water quality.

"Assessment of corrosion control treatment using Detroit source water with lead pipe loop rigs in advance of switching to the KWA source may also be transferrable to the KWA source water." I think that you must also note the loops will help predict whether lead release will be an issue when the new plant goes on line (see last draft suggestions).

Hi all –

Please see attached. I think it incorporates many, if not most of the edits from you all. It is a clean version, because, frankly, the mark-up had become somewhat noisy. The one thing that Mike suggested – to offer up TSC as a third party consultant – has not been incorporated. It is a good suggestions and will have its time and place, but I am hoping to keep this focused on the need to do a performance assessment before distributing water to the public, and the need to maintain access to and use of an alternate source in the interim. We are adding a lot of good detail to that message, but at some point I fear we will bury or lose the message.

We would like to get this out today. Please let me know this afternoon if you are ok with Bob sending this, or make edits you need to see for it to be acceptable to you.

I recommend that Bob's transmittal message to the City be succinct, along the lines of the following:

Natasha –

You had asked about the EPA Flint Safe Drinking Water Task Force position regarding an alternative source of water that Flint would use as the transition to KWA supplied water played out. Attached, please find the Task Force recommendations. Please feel free to contact me if you have questions.

"Because of similarities in source water and in treatment processes with Detroit's Huron plant, the Flint water plant will likely be configured to produce treated water with similar quality ~~substantially similar~~ to that of the water currently being received from Detroit."- Although we hope this will be accurate if that is the intent, I can't tell how likely that will be. Also, just because processes (and source water) are the same, they can be operated totally differently and produce totally different finished water quality. I agree. To Darren's point, we have discussed this with the city, engineer, etc. But as far as I know, we do not have a firm design and confirmation as to exactly what the coagulant will be, the dosage, the residual, etc. All could affect the effectiveness of the lead release control, TTHMFP, etc.

"Assessment of corrosion control treatment using Detroit source water with lead pipe loop rigs in advance of switching to the KWA source may also be transferrable to the KWA source water." I think that you must also note the loops will help predict whether lead release will be an issue when the new plant goes on line (see last draft suggestions). **Yes, this is a significant point.**

I like the change that Mike made on the plant configuration. Detroit's Lake Huron plant does not have ozone, so if Flint is retaining the ozone treatment (and it seemed like they planned to last month), then the treatment trains won't match even if Flint uses alum and the Lake Huron plant continues to use it.

I am fine with Darren's other change about the loops and lead release.

Hope that helps.

Jeff

Subject: RE: Performance Evaluation Period

Hi all –

Please see attached. I think it incorporates many, if not most of the edits from you all. It is a clean version, because, frankly, the mark-up had become somewhat noisy. The one thing that Mike suggested – to offer up TSC as a third party consultant – has not been incorporated. It is a good suggestions and will have its time and place, but I am hoping to keep this focused on the need to do a performance assessment before distributing water to the public, and the need to maintain access to and use of an alternate source in the interim. We are adding a lot of good detail to that message, but at some point I fear we will bury or lose the message.

We would like to get this out today. Please let me know this afternoon if you are ok with Bob sending this, or make edits you need to see for it to be acceptable to you.

I recommend that Bob's transmittal message to the City be succinct, along the lines of the following:

Natasha –

You had asked about the EPA Flint Safe Drinking Water Task Force position regarding an alternative source of water that Flint would use as the transition to KWA supplied water played out. Attached, please find the Task Force recommendations. Please feel free to contact me if you have questions.

I like the change that Mike made on the plant configuration. Detroit's Lake Huron plant does not have ozone, so if Flint is retaining the ozone treatment (and it seemed like they planned to last month), then the treatment trains won't match even if Flint uses alum and the Lake Huron plant continues to use it.

I am fine with Darren's other change about the loops and lead release.

Hope that helps.

Jeff

Comments:

"Because of similarities in source water and in treatment processes with Detroit's Huron plant, the Flint water plant will likely be configured to produce treated water with similar quality ~~substantially similar~~ to that of the water currently being received from Detroit."- Although we hope this will be accurate if that is the intent, I can't tell how likely that will be. Also, just because processes (and source water) are the same, they can be operated totally differently and produce totally different finished water quality. I agree. To Darren's point, we have discussed this with the city, engineer, etc. But as far as I know, we do not have a firm design and confirmation as to exactly what the coagulant will be, the dosage, the residual, etc. All could affect the effectiveness of the lead release control, TTHMFP, etc.

"Assessment of corrosion control treatment using Detroit source water with lead pipe loop rigs in advance of switching to the KWA source may also be transferrable to the KWA source water." I think that you must also note the loops will help predict whether lead release will be an issue when the new plant goes on line (see last draft suggestions). **Yes, this is a significant point.**

Thanks for getting back to me. I need to ask you to look at another set of revisions. Bob wanted to ensure that we retained the substantive recommendations, but focus the paper, eliminate redundancies and make it generally more concise. He and I went through it once again, and attached is the result. Please take a look and let me know if it misstates anything or if there is anything that is essential to say, but is now missing.

SERVICE OR ACHIEVEMENT WHICH MERITS SPECIAL HONOR

Describe the service or achievement which merits a National Honor Award. Include the following: (1) indicate whether this achievement is completed or ongoing; and (2) describe how the achievement **exceeds** the person's or team members' normal duties. **Margins must be one inch (both sides) and typed in 12-point Times New Roman only.** Any narrative description which exceeds these two pages will be rejected in its entirety.

The Safe Drinking Water Act establishes standards and other requirements to protect the health of people who get their drinking water from a public water system. The requirements applicable to lead are complicated as the source of lead contamination in drinking water is often from the drinking water distribution system (especially service lines from the main line to homes and other users) and plumbing within homes and buildings. Furthermore, there is no "safe" level at which to set a standard. Consequently, the SDWA establishes requirements for water suppliers to ensure corrosion control, test for its effectiveness and take action if trigger levels are exceeded in drinking water at the tap. Under the SDWA these requirements are administered by states when they obtain "primacy" and EPA acts in an oversight role.

Up until April 2014, Flint, Michigan purchased drinking water from the Detroit Water and Sewerage District. The water was treated by Detroit to provide corrosion control for lead. Flint changed its source of drinking water to the Flint River in April 2014, and began treating the water at its own treatment plant before distribution to the public. Almost from the start, Flint experienced problems with its treated water, beginning with taste and odor complaints and concerns about rashes from users, followed by violations of bacteria standards and exceedance of disinfection byproducts standards for total trihalomethane compounds. In February 2015, one of the nominees was informed by a Flint resident of high lead levels in her drinking water and children's blood. This award recognizes the work of the three nominees to investigate and assess the lead in drinking water problems in Flint, identify its likely cause, and advise management in the State and Region of the situation, triggering a remedial response that continues to this day. While the lead issue has yet to be fully resolved in Flint, the actions of the nominees to bring it this far are award-worthy.

Miguel Del Toral is a nationally recognized expert on lead in drinking water and the lead and copper rule, with experience working throughout the Region on problems with sampling for lead in drinking water and controlling lead sources and using that experience to inform revisions to the rule. When notified by the resident, Miguel Del Toral began to work with her to better understand the extent of the problem and factors likely contributing. In the process, Miguel told the resident about Mark Edwards, a renowned lead expert who would also begin working with her to characterize her contamination problem, and he secured the assistance of the Region 5 laboratory to analyze water samples. Over the course of the late winter and spring, Miguel and Jennifer travelled to Flint to meet with the resident, assess the plumbing at her home, provide sample bottles for collection and analysis of her home tap water, and to collect a sample of the resident's service line when it was removed by the city.

Starting in February, together with Jennifer Crooks, the EPA drinking water program manager responsible for Michigan, Miguel immediately brought the matter to the State's attention and the two began to ask questions about how the State was advising Flint about compliance with the lead and copper rule and what sort of corrosion control treatment Flint was providing. The State initially indicated that Flint had an optimized corrosion control program. However, through their persistence and repeated communications with Michigan, by April Miguel and Jennifer were able to confirm that the state had not required Flint to provide corrosion control treatment, but instead simply required compliance testing to see if action levels would be exceeded. Finally, in light of the importance of the compliance testing, Miguel and Jennifer reiterated our long-standing concerns about the instructions the State provides to residents to pre-flush the water lines the night before sampling, knowing that the practice would have the effect of keeping sample results low.

NARRATIVE DESCRIPTION, *CONTINUED*

Tom Poy is the manager of the Ground Water and Drinking Water Branch, responsible for the SDWA programs in all of the Region 5 states. Throughout the process he supported the efforts of Miguel and Jennifer to understand the lead issues in Flint, and to communicate our concerns to Michigan. He also charged Miguel with compiling the results of the work at the Flint residence and other lead testing results from Flint into a report that could be used by management.

Miguel completed the interim report requested by Tom on June 24, and it provided the basis for a series of actions by Division and Regional leadership. The results to date have been compelling:

ò Michigan admitted that it made mistakes implementing the lead and copper rule;
ò Flint was directed by Michigan in August 2015 to begin treatment for corrosion control no later than January 2016; Flint subsequently switched back to Detroit water in October 2015 and is expected to begin providing additional corrosion control treatment in December 2015;
ò EPA nationally issued a clarifying memorandum confirming that corrosion control treatment must be maintained when drinking water sources are changes; and
ò Michigan has committed to eliminate the practice of pre-flushing the night before lead and copper rule compliance samples are taken by residents.

The efforts of the three nominated individuals brought the issues in Flint to light and prompted remedial action on the part of the city, state and EPA. The work described clearly went above and beyond their normal oversight role with a primacy state, and was critically important given the toxicity of lead especially to the young and the disadvantaged community affected by the problem. Throughout the process they have maintained a high degree of professionalism, even as one was branded a "rogue employee" by a State spokesperson. Finally, recognizing how much we rely on States to implement the SDWA, they have approached the issue as a public health problem that had to be resolved -- but resolved with the State, making improvements to the State program rather than condemning it.

CITATION

In 25 words or less, summarize the service or achievement for which this nomination is being submitted. This citation will appear on National Honor Award certificates, plaques, the Ceremony program, and the National Honor Awards website.

For Actions to Identify and Resolve a Public Health Crisis in Flint, Michigan

SUPPORT STAFF STATEMENT

Support staff must be permanent Federal Government employees. Senior Environmental Employment (SEE) program enrollees, students hired under the Student Temporary Employment Program (STEP), and contractors are **not** eligible to receive National Honor Awards.

The activities recognized by this award were conducted with minimal support staff involvement; that received was from a student trainee.

Subject: From the Free Press: When did state know kids in Flint were lead poisoned?

http://www.freep.com/story/opinion/columnists/nancy-kaffer/2015/12/17/flint-water-lead/77365380/

When did state know kids in Flint were lead poisoned?

Nancy Kaffer, Detroit Free Press Columnist 12:04 a.m. EST December 17, 2015

When did the State of Michigan first learn that kids in Flint had been poisoned by lead in the city's drinking water?

This is one of the most critical questions to answer in the aftermath of a public health crisis that's still unfolding in one of the state's largest cities.

And it shouldn't be a hard question to answer.

But when I asked Gov. Rick Snyder this week, he said he couldn't recall.

Officials at the state department of health say they didn't know what was happening until a Flint pediatrician released her own analysis in September -- even though data previously collected by the state showed the same trend, a reversal in a decades-long decline in the percentage of kids with lead in their blood.

And the health department has been stalling a Virginia Tech University researcher who has been trying to get public records that could show who knew what, and when.

It's ridiculous. Immediately after Snyder acknowledged there was a problem in Flint, the Free Press editorial board encouraged him not to slow-walk the postmortem. Snyder has appointed an after-action task force to find out what happened, and he told the Free Press this week that he's waiting for that report to provide answers to many of these questions -- but answers should certainly be readily available for the man in charge of the state departments involved in this fiasco.

So inconsistency and obfuscation continue.

Regardless of individual culpability, the water crisis in Flint has shown that the state systems designed to ensure safe drinking water and healthy children tilt toward inertia: Despite mounds of data, despite understanding the consequences of lead exposure, Flint was allowed to pursue a reckless water treatment program with the approval of everyone from the Flint City Council to the state Treasurer's Office and the Michigan Department of Environmental Quality.

Flint switched its water supply in April 2014, drawing its drinking water from the Flint River while a new regional water system it plans to join next year is under construction. The local water treatment plant, with the approval of the Michigan Department of Environmental Quality, failed to add chemicals to the river water that would have prevented lead in aging service lines from leaching into the water. All of these decisions were made with the approval of a series of emergency managers, appointed by Snyder to guide the city back to financial stability.

Within months, the amount of lead in Flint's drinking water soared. Lead poisoning is irreversible, and can cause behavioral and developmental problems in children.

After an initial six-month round of testing was complete in January, results showed that the amount of lead in Flint's water was rising, although still within what state officials say they believed were federal safety guidelines. The U.S. Environmental Protection Agency got involved; a memo written by an EPA water regulations manager found fault with both Flint's water treatment and MDEQ's water testing protocol. But nothing happened. State officials continued to insist that Flint's drinking water was safe, even as internal documentation showed that it wasn't.

So, we know that state officials knew that lead in Flint's water was rising, months before officials publicly acknowledged what was happening. But when should the state have known that the percentage of Flint kids with elevated blood-lead levels was growing?

Virginia Tech's Marc Edwards, a MacArthur genius grant recipient who has tested water samples from hundreds of Flint homes, submitted a request under the state's Freedom of Information Act for documents related to elevated blood-lead levels in Flint kids to the state health department in early November. The department notified him later that month that the documents he'd requested were ready. He paid the state's tab, and waited. He's still waiting.

A health department lawyer wrote in an e-mail to Edwards that a "litigation hold" placed by state Attorney General Bill Schuette's office, because of a lawsuit filed by Flint residents alleging the state acted improperly when it switched to river water, meant she couldn't release the documents. But Schuette's office told a Free Press reporter that there was no "litigation hold" (a term Free Press lawyer Herschel Fink, who has decades of experience litigating the rules surrounding public documents, said he'd never heard).

When Edwards informed the lawyer that the AG's office hadn't supported the notion of a litigation hold, the health department lawyer said she needed to review the documents to see if any were subject to attorney-client privilege. Again, Fink looked askance at this explanation: Public documents don't become private by simply virtue of being associated with a lawsuit.

Why is the health department stalling? I'm not sure, and it would be irresponsible to speculate.

For months, state officials denied that the water in Flint had problems. In July, MDEQ spokesman Brad Wurfel told Michigan Radio that folks in Flint could "relax." In an internal e-mail, Wurfel wrote that community groups were keeping people in Flint "hopped up." When Mona Hanna-Attisha, the Flint pediatrician, released her analysis of Flint kids' blood-lead levels, the state's immediate response, across multiple departments, was to attempt to discredit her work. Snyder's spokeswoman said the data used by Hanna-Attisha -- a pediatrician with degrees in medicine and public health -- was "spliced and diced."

And the health department, in response to a Free Press request, sent over a batch of blood-lead testing data that it said would refute Hanna-Attisha's conclusions. But a straightforward reading of the data showed that the state's own blood-lead testing data confirmed the doctor's findings, Free Press data analyst Kristi Tanner found. Yet the state health department continued to deny that the spike in blood-lead levels the doctor identified were anything but a seasonal anomaly. A week later, the health department reversed course, completely endorsing Hanna-Attisha's findings.

Health department spokeswoman Jennifer Eisner wrote in an e-mail: "We work closely with our 45 local health departments across the state to provide public health services. Historically, a request would come to MDHHS from the local health department to conduct epidemiological analysis before our department would have stepped in. As part of our after-action report, we continue to review how we will conduct this process in the future."

But here's the thing: For months, state officials worked diligently, not to investigate the brewing public health crisis in Flint, but to discredit outside experts presenting test results contrary to the state's assertions that everything was fine. And all that time, data that would have shown what was happening was ignored.

Subject: Summary of Meetings on Flint with Sens. Stabenow and Peters and Cong. Lawrence

Good Morning,

The meetings yesterday went well and were productive. There were no specific follow ups – just a continued commitment to communicate with their staffs. The topline points were

- Need to prevent this from happening again
- Need to increase/improve outreach to residents to get filters, get water tested and flush lines before using water
- Want to know when the protective coating will be in place in the pipes
- Concern that Michigan does not have the expertise or will to ensure Flint establishes and maintains proper treatment in the long run

Specific questions/points from the meetings were

- Cong. Lawrence
  - This issue is coming from the citizens and people want answers
  - How does a resident know that their water is safe and is meeting standards? (Testing and Consumer Confidence Report)
  - What will come out of the audit of MDEQ's program? (Susan described the plan for the audit)
  - Were there gaps on EPA's end in identifying and/or correcting the problems? (We reviewed EPA's role, and we have been providing and continue to provide timely, critical technical support to the state and the city.)
- Sen. Stabenow

o The state is not doing helpful outreach. The information is not easy to get or easy to understand.

o Is there any kind of PSA that EPA can do? Need to do more to get the word out.

o Does Flint have to change from Detroit water to KWA? (They may be contractually obligated to switch.)

o Can the city really be ready to change water sources again? (The Task Force is working with the state and the city to begin planning for that now, including planning for a "shake-down" period to make sure that the treatment plant is fully operational before switching sources.)

•□□□□□□□□ Sen. Peters

o Has there ever been another system that did not add corrosion control? (This situation is unique, so the LCR did not account for it. The ambiguity of the rule, in terms of the need to continue corrosion control when switching sources, has been resolved.)

o How much will the switch to KWA cost, including the preparations? (We don't have dollar figure, yet, and Flint is still deciding on their approach.)

o Met with the City Administrator, and they do not have access to any funding.

o How soon do you think we'll be able to predict when the corrosion control coating will be in place? (There are too many variables to try to hazard a guess. In DC, it took months.)

Susan, Eric, Tiffany and Peter, please let me know if I left anything out or got anything wrong. Please let me know if you have any questions.

FLINT DRINKING WATER CLIPS

US. EPA REGION 5 – AS PREPARED BY PETER CASSELL (ORA/OEC/PA) ON DEC. 17, 2015

- EPA Flakes on Flint - Guest Post by Anjali Waikar (NRDC Blog)
- After ignoring and trying to discredit people in Flint, the state was forced to face the problem (Michigan Radio)
- Flint's Water Crisis Just Became A Double Emergency (Huffington Post)

EPA Flakes on Flint - Guest Post by Anjali Waikar (NRDC Blog)

I am thrilled to host this guest post from Anjali Waikar, staff attorney for NRDC's Environmental Justice Program:
If you haven't heard by now, there is an

existing public health crisis in Flint, Michigan, in which an entire city has been exposed to lead contamination. The source? The city's drinking water. The evidence is clear: no amount of lead exposure is considered safe. Even low lead exposures in childhood can lead to a range of lifelong consequences, including intellectual disabilities, lower IQs, and serious medical conditions.

Last month, NRDC notified the City of Flint and Michigan officials that we plan to sue them for violations of the Safe Drinking Water Act (SDWA), the federal law that requires public water systems to test, monitor, and treat drinking water to ensure that it's safe. We served the notice alongside a community group, Concerned Pastors for Social Action, the ACLU of Michigan, and Flint resident Melissa Mays, who have been among those leading the fight to expose this crisis.

In addition to notifying local and state officials about the lawsuit as required under the SDWA, NRDC also petitioned the federal Environmental Protection Agency (EPA) to use its emergency powers to step in and fix this public health crisis.
Astoundingly, last week - nearly two and a half months after we served the emergency petition

calling for immediate action - the EPA responded with a "status update" saying that it intends to hold off on acting on our emergency petition "until such time as the Agency determines that corrosion control treatment is fully optimized for the Flint system." In other words, EPA told us that it's not acting on the emergency petition until Flint deals with the issue on its own. Thanks, EPA.

Specifically, the 'ask' we made to EPA relates to the question of how lead appeared in the water in the first place. One way lead can appear is if the source water coursing through the pipes is corrosive; left untreated, corrosive water can result in lead leaching from the pipes until it makes its way to the faucet. This is what happened when Flint switched its water source from Lake Huron to the Flint River in 2014: the river water was highly corrosive, and the city and governmental officials failed to treat it. After the problem was uncovered, we asked EPA to step in to help Flint with this issue by "optimizing corrosion control" to help reduce that leaching effect, as the SDWA requires.

Make no doubt about it: this is a public-health disaster that requires city, state and federal leadership and cooperation, including more transparency about how Flint's drinking water is tested and treated. The state of Michigan and local officials have already made numerous missteps. For example, they had failed to acknowledge that the water wasn't safe to drink - even after testing found dangerously high lead levels in some residents' tap water. They had dismissed residents' concerns as "near hysteri[cal]" and "irresponsible," despite well-established evidence that there is no safe level of lead exposure. It took months of public outcry, led by community advocates like Melissa Mays, before city and state officials finally conceded that there was a problem with the water.

The EPA's reluctance to exhibit any meaningful leadership role in Flint reflects an unfortunate pattern of government officials in this case absolving themselves of any responsibility or wrongdoing. The people of Flint need less governmental mismanagement and more demonstrated leadership from the city, state and federal government. That is why we have given notice of our intent to sue. Adults are needed in the room--if EPA isn't going to do it, we will.

After ignoring and trying to discredit people in Flint, the state was forced to face the problem (Michigan Radio)

By LINDSEY SMITH • 22 HOURS AGO

http://michiganradio.org/post/after-ignoring-and-trying-discredit-people-flint-state-was-forced-face-problem#stream/0

STEVE CARMODY / MICHIGAN RADIO
Listen
Listening...
18:31
Listen to part three of the Michigan Radio documentary Not Safe to Drink.

If you missed parts 1 or 2 of Not Safe to Drink, you can find them here.

Back in September, research scientists from Virginia Tech came to Flint to break some bad news.

Marc Edwards, PhD, of Virginia Tech University, holds two vials of water, one from Flint and the other from Detroit. Edwards' research helped uncover the serious problems affecting Flint's water supply.
CREDIT STEVE CARMODY / MICHIGAN RADIO
Their tests showed high levels of lead in people's tap water. Lead is especially harmful for young children.

It can lead to things like a lower IQ and attention problems. And once that lead gets into a kid's blood, the damage is done. You can't reverse it.

So the researchers from Virginia Tech warned people in Flint to stop drinking the tap water.

Meanwhile, city and state officials continued to say Flint's water was safe.

"I don't know how they're getting the results they're getting," Michigan Department of Environmental Quality spokesman Brad Wurfel said at the time. "I know that it doesn't match with any of the other surveillance in the area and I think that it, at the end, I don't necessarily think it's as important as the broader issue of reminding people that if you have lead service lines to your home or you've got lead pipes in your home, it's worth being concerned about."

The impression the state repeatedly gave is that the risk to Flint residents was no different than it was when Flint got water from Detroit. It was no different in Flint than any other Michigan city with lead service lines.

But there were big differences between the water Flint got from Detroit and the water it pumped from the Flint River.

The most important one was corrosion control treatment

Corrosion control treatment is what coats the inside of old lead pipes and plumbing, preventing water from corroding lead and other heavy metals from the pipes and getting into people's tap water. Think of it like Pepto Bismol but for pipes.

flint river water more corrosive
When Flint bought water from Detroit, it was treated to control corrosion. But when Flint started pumping water from the river, it didn't use any corrosion control treatment. That's because officials at Michigan's Department of Environmental Quality told the city it didn't need to.

Not right away, anyway.

MDEQ said Flint needed a year or so to test the water first to figure out the right treatment.

Wurfel put it this way:

“It's just a matter of getting it right. You know if I handed you a bag of chocolate chips and sack of flour and said ‘make chocolate chips cookies,’ we’d still need a recipe, right? And they need to get the results from that testing to understand how much of what to put in the water to address the water chemistry from the river which is different from the water chemistry in Lake Huron.”

But all the other water experts I talked to said this wait-and-see approach was a really bad idea.

Without treatment, the protective coating on the inside of the pipes that built up over the years from Detroit’s water likely disappeared. And that’s what caused lead levels to spike in many homes in Flint.

When Lee Anne Walters discovered Flint wasn’t treating for corrosion control last March, she told the federal Environmental Protection Agency. The EPA asked the state about it right away.

At first, the MDEQ said Flint was using corrosion control. But when the EPA asked what kind of treatment it was using, the state confessed: Flint wasn't doing anything.
And at first, the MDEQ said Flint was using corrosion

control. But when the EPA asked what kind of treatment it was using, the state confessed: Flint wasn't doing anything.

Peter Grevatt, who directs the EPA's Office of Groundwater and Drinking Water, says it's really unusual for a city to go from buying completely treated water (what Flint got from Detroit) to treating its own.

It's fair to say state regulators had not dealt with this situation in recent memory.

Because of the lead problems in Flint, Grevatt has sent a clarifying memo to all states, saying basically, you cannot not have corrosion control treatment. It's too important to skip, even for a little while.

"We have about 10 million lead service lines in the ground across the country," says Grevatt. "So we know for certain that there are many communities that have building materials in their distribution systems that could present a hazard to the population. More than 99% of the 52,000 drinking water systems across the country have been able to meet the requirements of the lead and copper rule and protect the public."

The water service line is the pipe that takes water from the water main, in front of your house, to your house. Before the 1960s, many water service lines were made of lead.

Many of the 10 million lead service lines that remain in the country are in older cities. Cities like Flint.

Flint should've tested for lead at homes with lead service lines. People who live in these homes have the highest risk of lead exposure from their water. If a city's water treatment isn't working, that's where it would show up first.

But here's the thing. Flint doesn't even know where its lead service lines are.

A century's worth of records on index cards

In Flint's public utility building, on the side of a hallway, there are six standard filing cabinets. On top of the cabinets is a stack of tattered, yellowing maps.

Flint's records of where its lead service lines are located are still on hundreds of index cards.
CREDIT STEVE CARMODY / MICHIGAN RADIO

Inside the filing cabinets are two incomplete sets of records. Some are like a time capsule, handwritten index cards going back a century.

These index cards, these yellow maps, these are Flint's records.

"It's not ideal but it is what we have," Flint's Water Distribution Supervisor, Robert Bincsik, admitted. "A lot of things that you, I know personally, I mean, I spent a lot of time in the field, so a lot of things you learn, I mean you, we just do from memory. I mean, a lot of this stuff there's a lot of things about the water system I know that are just in my personal memory. We do with what we have and we try to do the best we can and this is what we have."

Other Flint records are visibly decaying.
CREDIT STEVE CARMODY / MICHIGAN RADIO
So when Flint tested for lead in its water last summer, it wasn't testing the homes it was supposed to, mainly because Flint doesn't know exactly where those homes are. Its records of lead service lines live on 100-year-old index cards that aren't organized in any kind of helpful way.

Still, Flint officials relied on those records to pick which homes to test for lead. They also put a shout

out on Twitter. One employee canvassed his neighborhood, going door to door looking for water samples.

It got a little frantic the last weekend in June. Because by early July, Flint had to submit a report to the state.

This report was supposed to measure how much lead was getting into the water in neighborhoods with lead service lines. The numbers from each of those homes would get put through a math formula to arrive at one, very important, number.

That number would determine whether Flint's tap water was above or below a limit for lead set by the federal government.

What happened next kind of defies logic.

The state continues to say the water is safe

The state picked out two of Flint's samples that tested highest for lead -- and it invalidated them.

One of the samples the state tossed was from Lee Anne Walters' house. It was by far the highest lead sample in Flint's report.

“I was told by the EPA that they couldn’t throw my samples out,” she said. “That my samples had to be used.”

Officials with the MDEQ say they invalidated the sample for a technical reason - and of all reasons, it was that Walters had a water filter.

The bottom line is, by throwing these two high lead samples out, Flint’s number shifted. It went from being just above the federal limit, to just below the limit.

It meant city and state officials could continue saying the water was safe. It meant they wouldn’t have to mount a major campaign to tell residents how to protect themselves and their families from lead in their water.

I talked to Jim Sygo about this. He’s the guy the state put in charge of the MDEQ's water division after the department came under fire for its handling of Flint. I asked him -- even if it does turn out it was technically ok to throw out Lee Anne Walters’ sample, it just looks bad, right?

“Well, you know, there’s not a lot I can say about, a lot of things look bad to people until they understand what the process and the procedures are," he said. "I think our biggest point is we were following the requirements of the regulations basically in doing that."

So for awhile here, even after outside experts are raising the alarm about Flint's lead problem, the state kept sticking to its message that the water there was safe.

That is, until a Flint pediatrician decided to put her reputation on the line for Flint kids.

The percentage of kids with elevated lead levels nearly doubled

Dr. Mona Hanna-Attisha heads the Pediatric Residency program at Hurley Medical Center in Flint. She was the first to put together the data to find that blood lead levels of children in Flint had nearly doubled.
Less than a mile from the Flint River sits the Hurley Medical Center, where Dr. Mona Hanna-Attisha heads the Pediatric Residency Program.

She says a longtime friend of hers had heard about Flint's water problems, and suggested she take a look at lead levels in the city’s children.

She first ran the data on Hurley Children’s Clinic patients.

Right away, she noticed a significant increase in the percentage of kids with elevated blood lead levels when she compared samples from before the city switched its water source, and after.

“But our sample size was too small so I couldn’t go screaming from the rooftops,” she said. “This is such a politically messy issue. We are a city chartered hospital. And we get, you know, money from the state. It’s mayoral election season, so it is a mess.”

This group -- not politicians, not activists, but doctors -- called on the city to switch from the Flint River, back to Detroit's water
So Hanna-Attisha got her hands on more data. Pretty much all the data from the area, which goes to Hurley to get processed.

She ran those statistics, and her findings said after Flint switched to the river for its drinking water, the percentage of kids with elevated lead levels nearly doubled. That’s for children age five and younger, who live inside the city limits.

She rechecked her work over and over again.

Before she went public, she needed to be sure about this.

She gathered other area doctors together, and shared the information.

And on a Thursday in late September, they held a press conference to reveal their findings. And this group -- not politicians, not activists, but doctors -- called on the city to switch from the Flint River, back to Detroit’s water, to protect public health.

It was, forgive the pun, a watershed moment.

The dynamic begins to shift in Flint

Protestors in Flint
CREDIT STEVE CARMODY / MICHIGAN RADIO
“I was shocked to see so many people there. I think every mayoral candidate was at this press conference,” Hanna-Attisha remembers.

But state officials quickly tried to discredit Hanna-Attisha.

Over the next few days, state officials tried to convince reporters that Hanna-Attisha's numbers were wrong. Pretty quickly, she started getting calls and emails from reporters asking her to respond to numbers the state was releasing that tried to debunk her work.

Hanna-Attisha was sure she had it right. But she was basically getting a very public takedown from very powerful state agencies.

"I just started becoming almost physically ill," she said. "How can you not second guess yourself? How can you not feel like, oh my god, what did I do?"

She went back over the numbers. The numbers didn't lie.

It took several days, but eventually state officials came around. They rechecked their own numbers and found Hanna-Attisha was right.

Lee Anne Walters stood at the back of the room, during that first press conference, behind the TV cameras, watching Dr. Hanna-Attisha go through her slideshow. The slideshow featured a hypothetical Flint child.

Hanna-Attisha detailed the struggles this child might face after being exposed to high levels of lead.

This child would be at greater risk of needing special education. At greater risk of behavior problems, and ADHD. At greater risk of getting swept up into the criminal justice system.

The switch back to Detroit water came too late for Gavin Walters, whose blood lead level tests showed he has lead poisoning. His family has since moved down to Virginia, but his mom still uses bottled water, waiting on tests to confirm that the tap water there is safe.
CREDIT LINDSEY SMITH / MICHIGAN RADIO
Lee Anne Walters listened to all of these things about this hypothetical child. And she shed a few tears for a very real kid. Her four year old son, Gavin.

"The state nurse told me, oh, I understand your son has lead poisoning, but it's not as bad as it could be, he's only going to lose a few IQ points," she remembers. "No, that's my child. How would you feel if someone told you that about your child? How is that fair to him?"

It took a couple weeks, but eventually, officials in Lansing held their own press conference.

Michigan Governor Rick Snyder and other top state officials conceded. In the interest of public health in Flint, the city would stop using the Flint River for drinking water. After saying for months that Flint couldn't afford to switch back to Detroit's water system, the state, the city and the Mott Foundation managed to scrounge together $12 million.

And on October 16th, with much, much less fanfare, some Flint official pushed the tiny black button at the water plant to reopen the valve to Detroit water.

No more Flint River water.

It was a victory for the people in Flint who'd been fighting for this for more than a year now.

A victory too late for the Walters family

That came too late for Gavin, Lee Anne Walters' son.

In October, the Walters moved from Flint to Virginia. Walters' husband Dennis went from the Navy reserves, back to active duty. The Navy transferred them to Norfolk.

“A big, huge part of the reason why my husband went back to active duty was to get us out of Flint,” she said. “Because of what it was doing and the health concerns and the fact that we weren't being listened to with our child being poisoned.”

Gavin and Garrett Walters.
CREDIT LINDSEY SMITH / MICHIGAN RADIO
Her four year old twin boys are already doing better in Virginia. No more weird skin rashes. Gavin is putting back on some of the weight he lost.

In Virginia, even bath time has returned to normal.

In Flint, the lead levels in the Walters’ water were so high she was told not to let her kids even touch it. So once a week, she’d spend 45 minutes warming up jugs of bottled water on the stove to bathe her twin boys Gavin and Garrett.

Now, she just turns on the faucet. Makes sure the temperature is right. Plugs the tub. Throws in a few plastic Teenage Mutant Ninja Turtles. You know, like most any parent in America.

After everything this mom went through in Flint, you better believe she’s getting her water tested for lead in her new home, some 700 miles away.

But for now, Walters is still so wary about the safety of tap water, she doesn’t let the boys spend any more time in the tub than they need to.

“Look at me,” she tells them, when Gavin and Garrett protest an early end to bath time. “I promise you that once the tests come back and says it’s A-OK you will take a really, really, really long bath. Okay? Okay.”

So while bath time is back to normal in Virginia, the Walters still have a bottled water stash in the garage. She still uses bottled water to make everything from their morning coffee to the instant mashed potatoes at dinner.

“I will not drink it 'til it's tested,” she says. “I will never, ever trust a water source again, just because I'm told to.”

The struggle Lee Anne Walters went through as a mom, it’s put her in places she never imagined.

Countless late nights worrying. Confrontations with government officials, pediatricians, people who just didn't listen, refused to believe there was anything wrong.

Over the next few years, if Gavin has health problems or trouble at school, she'll be wondering: is this a symptom of his lead poisoning?
The experience has changed Walters, and her family too. It's not just the lead poisoning of one of her babies. Over the next few years, if Gavin has health problems or trouble at school, she'll be wondering: is this a symptom of his lead poisoning?

Even now, even though Walters is no longer in Flint, she's still fighting.

She's pushing for accountability from the state, she has testified in front of national panels, pestered U.S. congressmen, insisting the regulations on lead in water get tightened up; in the hopes that no other mom has to go through this nightmare again.

This is the third and final installment of Not Safe to Drink, a special documentary from Michigan Radio. Catch up with Part One and Part Two.

Flint's Water Crisis Just Became A Double Emergency (Huffington Post)

Turns out declaring an emergency doesn't make the emergency go away.

JeCorey Hawkins had a scary moment with the water in Flint, Michigan, in September. The 22-year-old psychology student had stooped at a drinking fountain at his university when the water took on a grainy texture in his mouth.
"I was very creeped out because I didn't know if I would be sick," Hawkins told The Huffington Post on

Tuesday. He said he and his family, which lives in Flint, hadn't been drinking tap water since earlier this year, though he trusted the University of Michigan's efforts to test and treat water on its Flint campus.

Flint's water problems turned out to be worse than most people realized when a local pediatrician reported in September that more children were being poisoned with lead, a dangerous neurotoxin. The continued problems with the water prompted Flint Mayor Karen Weaver to declare an emergency Tuesday.

"I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver said.

It's the second emergency declaration over toxic water for the beleaguered city -- Genesee County, which surrounds Flint, declared an emergency for the same reason back in October.

Jamie Curtis, chairman of the Genesee County Board of Commissioners, told HuffPost he didn't understand what Weaver hoped to achieve with her declaration, saying the mayor hadn't been in touch with any demands. He said the commission would take it up at its Jan. 4 meeting.

"I'm not sure what her declaration is," Curtis said. "What I don't think the people of Flint need ... is nothing more than rhetoric saying, 'I've declared this emergency,' but nothing comes of it."

The county's Oct. 1 declaration warned Flint residents not to drink the water unless it had been specially filtered and confirmed not to have high levels of lead.

The trouble started in 2014 when emergency managers appointed by Michigan Gov. Rick Snyder (R) decided to try saving money by switching Flint's water supply from the Detroit system to the Flint River. Local officials toasted the decision, though residents immediately complained about the taste, smell and appearance of what came from their taps. Most importantly, the new water turned out to be more corrosive, causing lead to leach from Flint's old pipes -- and into the city's kids.

Research published by Flint pediatrician Mona Hanna-Attisha in September showed levels of lead in children's blood spiked at the same time as the water switch. Elevated blood lead levels are especially harmful for children, who can suffer stunted growth and irreversible brain damage. In October, after denying any problem, state officialsacknowledged they failed to treat the water to adjust for its corrosiveness, and Snydersigned legislation switching Flint back to Detroit's water. The city has told residents it could take as long as six months for the water lead levels to decline.

A Dec. 11 report from the Michigan Department of

Environmental Quality said the state found elevated blood lead in 39 of 1,836 Flint residents who had testing done since early October. Blood lead levels can decline in a matter of weeks after a person is exposed to lead.

This week, in response to Weaver's new disaster declaration, a spokesman for Snyder referred HuffPost to previous statements from the governor's office outlining actions already taken, including an Oct. 2 action plan and the Oct. 21 creation of a special task force to investigate what went wrong and recommend solutions.

Hawkins wasn't impressed by the latest emergency declaration.

"It's kinda scary, but at the same time, it's like, the water has been this bad, you know, for all this time," he said. "They just decided to put a name to it at this point."

Hawkins has two younger sisters, 10 and 7 years old, who he said have suffered some hair loss, which is a common complaint among Flint residents who can't avoid bathing with the water.

"There is no reason for them to be losing hair at their age," Hawkins said.

This article has been updated with information from a Department of Environmental Quality report.

When did state know kids in Flint were lead poisoned?

Michigan governor Rick Snyder talks about the Flint water situation with the editorial board of the Detroit Free Press on Monday, December 14, 2015. Romain Blanquart Detroit Free Press

When did the State of Michigan first learn that kids in Flint had been poisoned by lead in the city's drinking water?

This is one of the most critical questions to answer in the aftermath of a public health crisis that's still unfolding in one of the state's largest cities.

And it shouldn't be a hard question to answer.

But when I asked Gov. Rick Snyder this week, he said he couldn't recall.

Officials at the state department of health say they didn't know what was happening until a Flint pediatrician released her own analysis in September -- even though data previously collected by the state showed the same trend, a reversal in a decades-long decline in the percentage of kids with lead in their blood.

And the health department has been stalling a Virginia Tech University researcher who has been trying to get public records that could show who knew what, and when.

It's ridiculous. Immediately after Snyder acknowledged there was a problem in Flint, the Free Press editorial board encouraged him not to slow-walk the postmortem. Snyder has appointed an after-action task force to find out what happened, and he told the Free Press this week that he's waiting for that report to provide answers to many of these questions -- but answers should certainly be readily available for the man in charge of the state departments involved in this fiasco.

So inconsistency and obfuscation continue.

Regardless of individual culpability, the water crisis in Flint has shown that the state systems designed to ensure safe drinking water and healthy children tilt toward inertia: Despite mounds of data, despite understanding the consequences of lead exposure, Flint was allowed to pursue a reckless water treatment program with the approval of everyone from the Flint City Council to the state Treasurer's Office and the Michigan Department of Environmental Quality.

DETROIT FREE PRESS

Snyder must act on Flint lead crisis

Flint switched its water supply in April 2014, drawing its drinking water from the Flint River while a new regional water system it plans to join next year is under construction. The local water treatment plant, with the approval of the Michigan Department of Environmental Quality, failed to add chemicals to the river water that would have prevented lead in aging service lines from leaching into the water. All of these decisions were made with the approval of a series of emergency managers, appointed by Snyder to guide the city back to financial stability.

Within months, the amount of lead in Flint's drinking water soared. Lead poisoning is irreversible, and can cause behavioral and developmental problems in children.

After an initial six-month round of testing was complete in January, results showed that the amount of lead in Flint's water was rising, although still within what state officials say they believed were federal safety guidelines. The U.S. Environmental Protection Agency got involved; a memo written by an EPA water regulations manager found fault with both Flint's water treatment and MDEQ's water testing protocol. But nothing happened. State officials continued to insist that Flint's drinking water was safe, even as internal documentation showed that it wasn't.

So, we know that state officials knew that lead in Flint's water was rising, months before officials publicly acknowledged what was happening. But when should the state have known that the percentage of Flint kids with elevated blood-lead levels was growing?

Virginia Tech's Marc Edwards, a MacArthur genius grant recipient who has tested water samples from hundreds of Flint homes, submitted a request under the state's Freedom of Information Act for documents related to elevated blood-lead levels in Flint kids to the state health department in early November. The department notified him later that month that the documents he'd requested were ready. He paid the state's tab, and waited. He's still waiting.

DETROIT FREE PRESS

Doctor: Lead seen in more Flint kids since water switch

MDEQ e-mails show stunning indifference to Flint peril

A health department lawyer wrote in an e-mail to Edwards that a "litigation hold" placed by state Attorney General Bill Schuette's office, because of a lawsuit filed by Flint residents alleging the state acted improperly when it switched to river water, meant she couldn't release the documents. But Schuette's office told a Free Press reporter that there was no "litigation hold" (a term Free Press lawyer Herschel Fink, who has decades of experience litigating the rules surrounding public documents, said he'd never heard).

When Edwards informed the lawyer that the AG's office hadn't supported the notion of a litigation hold, the health department lawyer said she needed to review the documents to see if any were subject to attorney-client privilege. Again, Fink looked askance at this explanation: Public documents don't become private by simply virtue of being associated with a lawsuit.

Why is the health department stalling? I'm not sure, and it would be irresponsible to speculate.

For months, state officials denied that the water in Flint had problems. In July, MDEQ spokesman Brad Wurfel told Michigan Radio that folks in Flint could "relax." In an internal e-mail, Wurfel wrote that community groups were keeping people in Flint "hopped up." When Mona Hanna-Attisha, the Flint pediatrician, released her analysis of Flint kids' blood-lead levels, the state's immediate response, across multiple departments, was to attempt to discredit her work. Snyder's spokeswoman said the data used by Hanna-Attisha -- a pediatrician with degrees in medicine and public health -- was "spliced and diced."

DETROIT FREE PRESS

State data confirms higher blood-lead levels in Flint kids

And the health department, in response to a Free Press request, sent over a batch of blood-lead testing data that it said would refute Hanna-Attisha's conclusions. But a straightforward reading of the data showed that the state's own blood-lead testing data confirmed the doctor's findings, Free Press data analyst Kristi Tanner found. Yet the state health department continued to deny that the spike in blood-lead levels the doctor identified were anything but a seasonal anomaly. A week later, the health department reversed course, completely endorsing Hanna-Attisha's findings.

Health department spokeswoman Jennifer Eisner wrote in an e-mail: "We work closely with our 45 local health departments across the state to provide public health services. Historically, a request would come to MDHHS from the local health department to conduct epidemiological analysis before our department would have stepped in. As part of our after-action report, we continue to review how we will conduct this process in the future."

But here's the thing: For months, state officials worked diligently, not to investigate the brewing public health crisis in Flint, but to discredit outside experts presenting test results contrary to the state's assertions that everything was fine. And all that time, data that would have shown what was happening was ignored.

Why?

When Edwards informed the lawyer that the AG's office hadn't supported the notion of a litigation hold, the health department lawyer said she needed to review the documents to see if any were subject to attorney-client privilege. Again, Fink looked askance at this explanation: Public documents don't become private by simply virtue of being associated with a lawsuit.

Why is the health department stalling? I'm not sure, and it would be irresponsible to speculate.

For months, state officials denied that the water in Flint had problems. In July, MDEQ spokesman Brad Wurfel told Michigan Radio that folks in Flint could "relax." In an internal e-mail, Wurfel wrote that community groups were keeping people in Flint "hopped up." When Mona Hanna-Attisha, the Flint pediatrician, released her analysis of Flint kids' blood-lead levels, the state's immediate response, across multiple departments, was to attempt to discredit her work. Snyder's spokeswoman said the data used by Hanna-Attisha -- a pediatrician with degrees in medicine and public health -- was "spliced and diced."

DETROIT FREE PRESS

State data confirms higher blood-lead levels in Flint kids

And the health department, in response to a Free Press request, sent over a batch of blood-lead testing data that it said would refute Hanna-Attisha's conclusions. But a straightforward reading of the data showed that the state's own blood-lead testing data confirmed the doctor's findings, Free Press data analyst Kristi Tanner found. Yet the state health department continued to deny that the spike in blood-lead levels the doctor identified were anything but a seasonal anomaly. A week later, the health department reversed course, completely endorsing Hanna-Attisha's findings.

Health department spokeswoman Jennifer Eisner wrote in an e-mail: "We work closely with our 45 local health departments across the state to provide public health services. Historically, a request would come to MDHHS from the local health department to conduct epidemiological analysis before our department would have stepped in. As part of our after-action report, we continue to review how we will conduct this process in the future."

But here's the thing: For months, state officials worked diligently, not to investigate the brewing public health crisis in Flint, but to discredit outside experts presenting test results contrary to the state's assertions that everything was fine. And all that time, data that would have shown what was happening was ignored.

Why?

http://www.freep.com/story/news/local/michigan/2015/12/17/flint-water-coordinator/77474574/

John Wisely, Detroit Free Press 7:46 p.m. EST December 17, 2015

Harvey Hollins, a former vice president of Wayne State University, has been tapped by Gov. Rick Snyder to coordinate the state's response to the Flint water crisis.

Snyder named Hollins this week after a task force recommended a single person or entity to lead the follow-up needed after lead was found in Flint's drinking water system. Experts concluded that the lead leached into the system from old pipes after the city began using Flint River water as its source supply. The city was under state emergency management when the switch was made.

"Harvey is well-versed in the issues and the challenges faced by our cities and will be effective in this role," Snyder said in a letter to a task force appointed to review the crisis. Hollins currently serves as Snyder's director of urban initiatives.

In October, Snyder rolled out a plan to conduct additional water and blood tests in Flint, expedite improvements to the city's water system and increase lead education for residents. Because the responses will come from several state departments, Hollins will coordinate them and inform the task force on their progress.

Snyder also agreed to a task force recommendation that "a readily understood dashboard should be developed that reports on the goals, timelines and assignments,"

Snyder created the task force in the wake of the Flint crisis, which saw lead levels rise in Flint drinking water and eventually in the blood of children.

In April 2013, Flint voted to join the newly formed Karegnondi Water Authority, which plans to draw water from Lake Huron and pipe it across Michigan's Thumb to Flint's water treatment plant. The day after the vote, the Detroit Water and Sewerage Department terminated a decades-long contract with Flint to supply water. Detroit gave the city one year to get a new source. The Karegnondi pipeline isn't scheduled for completion until 2016.

Flint switched to the Flint River water in April 2014 and almost immediately residents complained of foul smelling and tasting water. The city and the Michigan Department of Environmental Quality initially insisted the water was safe, but by September 2014, doctors had already detected a spike in the amount of lead seen in blood samples drawn from Flint children.

Experts found that the water leaving Flint's treatment plant was lead-free, but it was picking up lead from aging pipes in the system. Detroit had solved the problem by adding corrosion control chemicals to the water it sold to Flint, but the City of Flint wasn't adding them.

One man will lead the state’s efforts to deal with Flint’s water crisis.

Harvey Hollins, Office of Urban Initiatives, State of Michigan

Credit State of Michigan

Harvey Hollins is the director of the Office of Urban Initiatives. Gov. Snyder has appointed Hollins to oversee the state agencies responding to Flint’s water crisis.

Errors in how the water was treated (actually, how it wasn't treated) are blamed for unhealthy levels of lead in Flint’s drinking water going undetected for months.

State agencies insisted for more than a year that Flint’s drinking water was safe, after a switch from Detroit water to the Flint River. Outside groups disagreed, tracing rising lead levels in Flint tap water to the corrosive Flint River. Eventually, the state helped pay for the city to temporarily return to Detroit water.

But experts say the city’s tap water is not safe to drink.

The Michigan Department of Health and Human Services and the Michigan Department of Environmental Quality have been working with local agencies to respond to the ongoing crisis.

Hollins’ appointment follows a recommendation from the governor’s Flint water task force. The panel issued an interim list of recommendations this week. The task force says someone needs to coordinate state health and environmental agencies’ activities.

In a letter to the task force, Gov. Snyder describes Hollins as “well-versed” in the challenges facing Michigan cities.

Flint Mayor Karen Weaver welcomes the announcement.

“It should help to have one person be the point person because then you shouldn’t lose track of things. They shouldn’t fall through the cracks,” says Weaver.

Not everyone is happy with the governor's choice.

“Political appointees and public relations people are what got us into this mess, and they aren’t who we need leading us out of it,” says Flint State Senator Jim Ananich, “Anything less than a professional trained in emergency management or public health will not suffice.'

Ananich says he would like to see someone appointed from the Michigan State Police, the Federal Emergency Management Agency or the Department of Homeland Security.

The governor's Flint water task force also says there is a need to establish goals and set timelines now for fixing Flint’s water woes.

The panel’s final report on Flint’s water crisis is due next year.

Flint Mayor Declares State of Emergency Due to Water Crisis

The mayor of Flint, Michigan says her city is experiencing a "man-made disaster" after a 2014 switch to a new water source.

Officials in Flint, Michigan have declared a state of emergency due to the quality of the city's drinking water. So we know that Flint is not in a position to bear this burden alone and we are asking and looking for state assistance.

Weaver says as she promised during her campaign, she'll continue to fight the city's water issues - and getting a state or federal State of Emergency status will help offset some of the huge costs that have come along with water issues.

More than anything, a city-wide state of emergency is a step toward getting a state or federal declaration. He later told the same publication that the issue will receive a "full hearing" in front of the Genesee County Board of Commissioners on January 4.

The city has since switched its water source, but because Flint used inadequate corrosion controls, the tainted water so badly eroded pipes in the city that any water that flows through them is still unsafe to use.

Flint returned to Detroit's system in October.

Snyder created the task force in wake of the Flint crisis, which saw lead levels rise in Flint drinking water and eventually in the blood of children.

The damage is done.

Before the lawsuits start flying, Bolden said, "The first step is to get these kids tested, including the adults tested - because you know the kids - if you have lead poisoning, that leads to learning disabilities and other challenges". "Flint's water was so caustic; it was damaging auto parts at one of General Motors' engine plants", reporter Lindsey Smith said Tuesday in a documentary about Flint's water.

But experts say the city's tap water is not safe to drink. This comes after months of debate over Flint's water and medical evidence of elevated levels of lead in the blood of some children.

FLINT, MI -- Gov. Rick Snyder and members of the Flint Water Advisory Task Force are exchanging ideas about how to handle the Flint lead in water crisis in letters released today, Dec. 17, including the potential appointment of a point person to coordinate ongoing work.

In a Dec. 7 letter to Snyder, who appointed the five-member task force in October, the group acknowledges steps that have been taken to carry out the governor's plan to address damage caused by elevated lead levels in the city's drinking water.

But the group also makes initial recommendations for how to improve the effort, and the governor responds to those suggestions in the letter.

Snyder appointed the task force in October. The group members are Ken Sikkema of Public Sector Consultants, Chris Kolb of the Michigan Environmental Council, Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Hospital.

on December 17, 2015 at 11:04 AM, updated December 17, 2015 at 7:20 PM

FLINT, MI — Current actions to protect the public from lead in water appear to be taking place without a system to measure results and delineate responsibilities, according to a task force charged with reviewing Flint's lead-in-water crisis.

In a letter to Gov. Rick Snyder, who appointed the Flint Water Advisory Task Force in October, the group acknowledged steps, including distribution of free water filters, that have been taken to carry out the governor's plan to address lead levels in the city's drinking water.

But the group also makes initial recommendations for improvement, including that the state address:

The need for the Michigan Department of Health and Human Services and Department of Environmental Quality to set goals for actions in collaboration with local and federal agencies and organizations.

The need for a set of corresponding timelines for the goals.

The need to establish responsibility for meeting the goals in a timely fashion and for contingency plans for the state if the goals are not being met.

The need for clear, regular communication with the Flint community and stakeholder groups regarding action steps and updates.

That a single person or entity — "potentially independent of any one particular state agency" — serve as the point person to coordinate ongoing work.

"While the task force is far from done with our work, the initial review has presented a very disturbing situation that will require many actions to ... help those that have suffered," task force member Ken Sikkema said in a news release issued Thursday, Dec. 17.

The task force also released the governor's response to its letter. In it, Snyder said he has seen progress and recognizes "there is more work that must be done to ensure that this progress continues" regarding the Flint water crisis.

The task force letter said it is important that someone "potentially independent" of any state agency be appointed to coordinate ongoing activities and report on mitigation measures.

Snyder's letter recommends Harvey Hollins, the governor's director of the Office of Urban Initiatives, act as coordinator of Flint water work.

"Harvey is well-versed in the issues and the challenges faced by our cities and will be effective in this role," the letter said.

The governor's letter said he supports the suggestion of a dashboard approach to making information "about our work and progress more accessible to the Flint community" and that he has retained Chris DeWitt, a former Democratic strategist, to strengthen community outreach and "make sure residents have access to the information they need."

State Senate Minority Leader Jim Ananich, D-Flint, said in a statement Thursday that Flint needs a trained emergency management professional to coordinate assistance efforts here.

"Political appointees and PR people are what got us into this mess, and they aren't who we need leading us out of it," Ananich's statement said. "Anything less than a professional trained in emergency management or public health will not suffice."

The governor announced creation of the task force Oct. 21, the same day U.S. Rep. Dan Kildee, D-Flint, and Ananich called for the U.S. Environmental Protection Agency to carry out a similar review.

The EPA later agreed to carry out its own review, which also is ongoing.

Members of the state task force on Flint water are Sikkema, of Public Sector Consultants; Chris Kolb, of the Michigan Environmental Council; Dr. Matthew Davis, of the University of Michigan Health System; Eric Rothstein, of the Galardi Rothstein Group; and Dr. Lawrence Reynolds, of Mott Children's Hospital.

Sikkema and Kolb are co-chairmen of the task force.

Dave Murray, press secretary for Snyder, said in an email Thursday the governor and administration continue to cooperate with task force members, "who are making a thorough review of all city, state and federal responses and procedures related to water in Flint."

"We also expect members will make recommendations that could address potential challenges in other cities moving forward," the statement said. "Today's interim report and recommendations are one step in that process. We appreciate that the task force members are investing their time and expertise to help us ensure that people in Flint — and across our state — will have access to safe, clean water."

---

http://michiganradio.org/post/reporter-s-notebook-some-state-officials-still-denial-or-misinformed-over-flint-river-decision#stream/0

By Lindsey Smith • 21 hours ago

ShareTwitter Facebook Google+ Email

I don't blame the governor's press secretary for not understanding exactly who made the decision to have Flint pump its drinking water from the Flint River. It was a complicated-decision making process with multiple key players that lasted at least a few months.

Back in the spring of 2013, when this decision was made, Governor Rick Snyder's press secretary, Dave Murray, was one of "us"; a journalist working for The Grand Rapids Press/MLive.

He was one of the familiar faces around town among the smaller group of reporters in Michigan's second largest city. And let's face it; none of us were paying close attention to the water decision that was going on 100 miles away in Flint. It wasn't our beat, after all.

But for the last 12 weeks or so, pretty much all I've done is try to answer a single, important question: How in the world did the "Flint water crisis" happen?

The answer is so complex I couldn't cram all the details into the one hour-long documentary I was tasked to write. Shameless plug – you can listen to the documentary "Not Safe to Drink" here.

The first draft of the documentary included a very lengthy section detailing who made the decision to switch to the Flint River and the months long process that determined the city's fate.

But it got cut out.

It got cut because we decided that detailing the city and state officials who had a hand in that decision, to some degree, doesn't really matter. The bottom line is that the state regulatory agency responsible for overseeing water quality, the Michigan Department of Environmental Quality, should have ensured that water was safe to drink. The MDEQ failed on that front, we now know, to disastrous effect. We think it's in the public's interest to understand how that happened.

By not requiring Flint to treat the river water in a way that would've helped keep lead out of the drinking water, MDEQ became the most important focus for the "accountability" portion of this documentary.

Through months of research and lengthy, recorded interviews, my editors and I came to the conclusion that, had the water experts (specifically officials at MDEQ and the engineering firm Flint's emergency manager hired), done a better job, then who made the decision to go to the Flint River shouldn't have mattered. If they would've required corrosion control treatment, treatment any normal large city in America uses, treatment that the federal government has now made completely clear is absolutely required, the lead problems Flint has faced may not have ever happened.

I don't mean to be flip. Of course it matters who made the decision to switch to the river. But after that first edit, we decided we weren't going to spend one third of an hour-long documentary hashing out the "who-did-what-when" on the financial side of this decision if the more imperative complex issue we needed to convey was the major screw-up on the water treatment side of the decision.

So that five-page-long chunk in the first draft of the documentary about the financial decision that was made in the spring of 2013 got cut down to the following:

Flint was broke -- like “nearing bankruptcy” broke.

Flint had a string of these state-appointed financial hatchet men during this time -- trying to get the city’s finances straight.

They were looking for savings everywhere, and they had their eyes on the expensive water they buy from Detroit, so when Genesee County decided to build a new water system, one that’s separate from Detroit, Flint was definitely interested in joining.

Once it was clear Flint could save millions of dollars a year with the new system, Flint got on board.

But there was a catch. The new water system wasn’t built yet, and it wouldn’t be ready until the summer of 2016, at the earliest.

And once Detroit realized Flint was going to leave its system, it jacked Flint’s water rates up even more – to the tune of $10 million over the two years the new pipeline would be under construction.

So in the spring of 2013, Detroit kind of had Flint over a barrel.

It was state treasury officials who got creative.

Their solution?

Forget Detroit, Flint’s emergency manager said. Let Flint get really cheap water from the Flint River.

The governor’s press secretary, Dave Murray, called me Wednesday morning to take issue with this account. “That is simply not accurate,” he told me. With less than four hours until the documentary aired, I didn’t have time to argue. I had already had this discussion ad nauseam with his predecessor, Sara Wurfel, and with Treasury Department spokesman Terry Stanton. I referred Murray to my news director, Vincent Duffy.

The governor’s press office followed up on this call with a specific complaint to me and the news director. They didn’t think this part was accurate:

It was state treasury officials who got creative.

Their solution?

Forget Detroit, Flint’s emergency manager said. Let Flint get really cheap water from the Flint River.

In an email, the governor’s Deputy Press Secretary Anna Heaton wrote:

"That's not factual information for your readers and listeners. In fact, in the spring of 2013, the Flint City Council, and Mayor Walling, made the decision to switch to Karegnondi, and in the meantime, take some of its water from the Flint River. This was approved at the city council meeting in a 7-1 vote on Monday, March 25, 2013. Their decision was then sent to the emergency manager to approve. In fact, at the time, Flint City Council President Scott Kincaid said "I've never been a fan of staying with Detroit."

It is critical to note that Flint and Genesee Co. had been in discussions to start their own water authority for years before this decision was reached. They had been gathering information on a switch and leaning toward that decision far before the Gov. was even in office."

Here's what's true about what the governor's press folks are saying.

Yes, Flint had an interest in joining the new Karegnondi Water Authority before Governor Rick Snyder was in office.

Yes, Flint City Council voted on March 25, 2013 to join the Karegnondi Water Authority.

This is why I wrote "Once it was clear Flint could save millions of dollars a year with the new system, Flint got on board."

But the governor's press folks are either sorely misinformed or willfully blind to what happened after that vote.

Months and months after dealing with us reporters picking apart this decision, they still don't get it. I'm not breaking any news here. They should know this stuff by now.

Nowhere in that vote or other votes did Flint City Council say, "We support getting water from the Flint River." Yes, there was one councilman who did openly support that. But as a board, that vote never happened. Flint leaders never made that call (not that they had the authority to make such a call at that time anyway.)

Some state officials continue to confuse Flint's vote to join the Karegnondi Water Authority with the state appointed emergency manager's decision to temporarily switch to the Flint River.

I gotta be honest, after all the research I had done, I had a really rough time coming to terms with the fact that I simply did not have time in this documentary to recount the ins and outs of this decision more in depth. Even though it is super complicated, perhaps now is a good time to drag out the details.

For the sake of Michigan Radio's readers and listeners, and in response to the folks at the governor's press office, I've taken another crack at breaking down this part of the story.

Here's what happened when, and who was in charge:

July 2011: Rowe Engineering presents Flint City Council with a study evaluating the city's options for drinking water. The high cost of water prompts city officials to study their options. The study looks at three options; staying with Detroit's water, switching to the Flint River, and getting on board with the KWA, the new water system that's now being built in Genesee County. The study shows staying with Detroit is the most expensive option in the long run. Switching to the Flint River is cheaper than Detroit in the long run, but making it a permanent source would require more than $60 million up front; to remove dams, to find ways to dispose of residuals from the water treatment process, and to upgrade the city's water treatment plant. The most favorable option, the study found, was going to KWA.

December 2011: Financial reviews show Flint's finances are so bad, Governor Rick Snyder appoints Flint's first emergency manager. To start it was Michael Brown, but there are four different guys who hold this position over the next four years.

Fast forward a year, to **December 20, 2012.** Because of the financial emergency, the decision about the best, most affordable water for Flint hasn't been made yet. But according to a report commissioned by the state treasury's office, on this day, there was a meeting with treasury and city officials. They discuss Flint's water options again. The report says that, on this day, it was decided that treasury officials would study only two options; staying with Detroit water or switching to KWA. Here are the key paragraphs on page two of this report, which comes out in **February 2013**:

"… An option for the Flint (Water Treatment Plant) to supply the City of Flint without being supplied from either (Detroit) or KWA was initially considered. The preliminary investigation evaluated the cost associated with the required improvements to the plant and to the Flint River dam system. Although it appeared that this was a viable option, Flint in a meeting on December 20, 2012 with the Treasury, stated that the City did not want to pursue the option and it is no longer being considered."

One thing to note, Treasury Department Spokesman Terry Stanton did point out that they also tried to figure out a way to blend Detroit's water with the Flint River water, to save the city money. But those talks broke down.

Detroit Water and Sewer Department Board Chair Jim Fausone told me that's because Detroit was concerned that Flint wouldn't be able to treat the river water properly. If there were any problems at people's tap, it could be difficult to figure out which water source was causing problems.

March 2013: Flint City Council votes in favor of joining KWA. The board does this even though it has no authority with the state emergency manager in place.

April 2013: State treasury officials approve Flint's move to join KWA. The same month, Detroit sends Flint a letter announcing Detroit would end Flint's long term contract to buy water, citing a legal clause in the contract. Many times, spokespersons for

Michigan's Treasury Department, the Governor's Office, and even Flint's emergency managers themselves have erroneously claimed this is the point where Detroit "cut Flint off" from the water supply. Yes, Detroit notifies Flint it will give the city one year at the long term contract rate structure, but after that, it would need to negotiate another contract. The other, shorter term options were more expensive than the longer term deal. Detroit, by no means, kicked Flint off its water system, as many state officials have claimed.

June 2013: Flint Emergency Manager Ed Kurtz hires an engineering firm "for assistance in placing the Flint Water Plant into operation using the Flint River as a primary drinking water source for approximately two years and then converting to KWA." Later that week, people from that engineering firm, Michigan's Department of Environmental Quality, Genesee County and Flint's water department met to determine if temporarily switching to the Flint River was feasible. They decided "the Flint River would be more difficult to treat" but that it was a viable source. They said there would be "obstacles" to get everything in place before April 2014, when Flint's contract with Detroit would end, but that it was "reachable." Lastly, they decided, "with support from LAN engineering which works with several water systems around the state, quality control could be addressed." I tried to talk to LAN engineering. They declined to comment.

March 2014: Flint's Emergency Manager Darnell Earley sends a letter to Detroit's water system, refusing the final short term contract offer. It acknowledges the option to continue buying water from Detroit. But these short term offers would've cost Flint at least $10 million more over the two years it would take to build the new water system Flint will join next year. Instead, Earley writes, "the City of Flint has actively pursued using the Flint River as a temporary water source." The only people with any authority over this decision were Flint's string of emergency managers.

April 2014: Michigan's Department of Environmental Quality signs permits that approve "Improvements to the City of Flint Water Treatment Plant to enable treatment of Flint River water on an interim basis until the KWA Lake Huron Water Supply is available for connection and use by the City of Flint."

Again, I'm not breaking any major news with this.

The ACLU's Curt Guyette has been nailing this point home for a while now.

Flint officials toast each other as they flip the switch to get water for the city from the Flint River.

Credit WNEM-TV

Through his Freedom of Information Act Requests, he discovered the letter from Darnell Earley, declining Detroit's offer to purchase water.

He's also caught numerous officials on video saying Detroit "cut Flint off" from the water system. Here's a video that gives you an idea of the spin machine at work.

The Detroit Free Press did a breakdown in late November too. They couldn't find a document that determines exactly which person made the call to put the Flint River back on the table as a viable option. But, ultimately, Paul Egan highlighted the same two important documents I saw – the February 2013 report for treasury that says the Flint city leaders were no longer considering the river as an option and then the June 2013 decision from Ed Kurtz, to hire an engineering firm to prepare Flint's Water Treatment Plant for the Flint River.

A Flint resident cries out during the filing of a class action lawsuit against city and state government officials on Monday, Nov. 16, 2015. MLIVE.COM /Landov

The mayor of Flint, Michigan says her city is experiencing a "man-made disaster" after a 2014 switch to a new water source.

She says the city's usage of water from the Flint River elevated blood lead levels in children, leading to irreversible health effects.

In a televised interview on The Rachel Maddow Show on Tuesday, Mayor Karen Weaver called her choice to declare a state of emergency "the only step we could take at this point," adding that the city is seeking state and federal funds in light of health problems of the city's children.

"We know that Flint is not in a position to bear this burden alone, and we are asking and looking for state and federal assistance. And the only way that we were going to happen was to declare a state of emergency, and hopefully that gets it to the county which will get it to the state where the governor can make it federal."

But it's not clear that Genesee County will support Mayor Weaver's request for federal disaster aid, which is a crucial step in elevating the issue to the federal level, The Flint Journal-MLive reported Tuesday. County board Chairman had initially said "that there's no need for the state of emergency" because "nothing more can be done." He later told the same publication that the issue will receive a "full hearing" in front of the Genesee County Board of Commissioners on January 4.

The Wall Street Journal explained the problem began when Flint switched to a new water source:

"The city of nearly 100,000 has been battling a water crisis for months after it became increasingly clear that switching its water source to the Flint River in April 2014 caused lead levels in drinking water to rise. The temporary switch was part of a cost-cutting move away from Detroit's water system before Flint could begin receiving water from another authority in 2016.

The city stopped using the Flint River as its water source in the fall, after the extent of the contamination became apparent."

High levels of lead are especially harmful to children and pregnant women, and can cause "learning disabilities, behavioral problems and mental retardation," the World Health Organization says.

A study conducted by a local medical center released in September showed that 2.1% of children 5 and under had elevated blood lead levels before the switch to Flint River water, compared to 4.0% after the switch.

Dr. Mona Hanna-Attisha, a doctor in Flint who discovered the elevated lead levels, told NPR's Michel Martin in October that the health impact on these children will be permanent:

The damage is done. Lead is a irreversible neurotoxin, so once you are exposed, you're exposed. It crosses the blood-brain barrier. It impacts cognition and behavior and mental health and lifetime, you know, potential, so the damage is done. So the other thing - our research entirely underestimates the risk because lead in water disproportionally affects infants on formula.

Michigan Radio gives us a sense of just how destructive this water is. "Flint's water was so caustic; it was damaging car parts at one of General Motors' engine plants," reporter Lindsey Smith said Tuesday in a documentary about Flint's water.

The station reported last month that four families have filed a class action lawsuit against the city and state. Attorneys are "hoping to sign up tens of thousands" more to seek damages for their health problems.

And the situation is still dangerous for Flint residents, the city's mayor says. The problem with the new water source was that it was damaging and corroding the water pipes, releasing lead into the water. Mayor Weaver told Rachel Maddow that even though the city has switched back to their original water supply, "when the water comes through, the lead leaches out—and that's why there's still a problem with lead."

An entire generation could suffer.

12/18/2015 06:00 am ET

Arthur Delaney Senior Reporter, The Huffington Post

Philip Lewis Fellow, The Huffington Post

An unknown number of children in Flint, Michigan, were exposed to dangerous amounts of lead in their drinking water because of a cheapskate decision to switch the city's water source in 2014.

Lead poisoning is less prominent as a public health concern than it used to be thanks to a decades-long effort to reduce lead exposure in children, especially from paint and gasoline. But lead poisoning itself is no less serious, because once a small child is poisoned, they can't be cured.

"We've been so aggressive about this because of what it can do to the whole life course trajectory of a child," Dr. Mona Hanna-Attisha, a Flint pediatrician, told "So That Happened," the HuffPost Politics podcast.

"Because [lead is] a neurotoxin, it affects your brain, it affects your development, it drops your IQ," Hanna-Attisha said. "It also causes problems with behavior. Increases the incidence or likelihood of violent offenses, aggressive behavior."

Indeed, researchers have shown a correlation between environmental lead levels and crime rates over the years.

When Flint switched its water source from the Detroit system to the Flint River last year as a way to save $5 million, the government failed to adjust for the corrosiveness of the new water. In August, Marc Edwards, a civil engineering professor from Virginia Tech, led a team that conducted its own sampling of water from Flint homes. Their investigation showed the water contained dangerous amounts of lead.

"In late August, we were hearing reports from a Virginia Tech team of elevated levels of lead in the water," Hanna-Attisha said. "We rightly freaked out, and that's when we decided to do our research."

Only after Hanna-Attisha reported elevated blood lead levels in Flint kids did the local government declare an emergency and tell people to stop drinking the water. Not that you needed a lab to know something was wrong with it.

"Right when the water switch happened, people complained about this water," Hanna-Attisha said. "It smelled gross, it looked gross."

Even Flint residents who may not have suffered acute lead poisoning, who aren't filing lawsuits against the city and state governments, have been burdened by the bad water.

"We have to buy bottled water to cook with, brush our teeth, drink," Flint resident Brion Morris, 31, told HuffPost. "And then we have two dogs, so, to keep my dogs from getting sick, I give them bottled water, too."

Morris' fiancee, Deshia Thompson, lamented that they can't avoid bathing with the water.

"We haven't been sick, but the water bothers my skin. It makes me itch whenever I come out the shower," Thompson, 38, said in an interview. Rashes and hair loss have been a common complaint among Flint residents.

In October, Michigan Gov. Rick Snyder (R) -- who had appointed the emergency managers that oversaw the switch -- signed legislation switching Flint back to Detroit's system. But it could take half a year for the lead levels to decline, and Morris said the water coming out of his taps is still nasty. Flint mayor Karen Weaver declared a state of emergency on Tuesday.

"It shouldn't have took this long for them to took responsibility and to let people know that this is serious," Morris said. "That's what we elect office to do, is to inform us of things that we need to know, and to help us to get those things rectified. If they can't do that, they shouldn't be in office."

As for the kids confirmed to have had high levels of lead in their blood, Dr. Hanna-Attisha said the repercussions will be felt over a lifetime.

"In seven years, when a kid gets diagnosed with ADHD, that mom is going to have that guilt -- was this because of the lead? Was this kid always going to have ADHD? We will never be able to pinpoint exactly what the lead caused."

Rachel Maddow Slams Rick Snyder For 'Poisoning Flint's Children' With Water Crisis

Mayor pins Flint's hopes on water disaster declaration

Rachel Maddow Slams Rick Snyder For 'Poisoning Flint's Children' With Water Crisis

http://detroit.cbslocal.com/2015/12/19/rachel-maddow-slams-rick-snyder-for-poisoning-flints-children-with-water-crisis-video/

December 19, 2015 9:44 PM

DETROIT (CBS Detroit) — The ongoing saga of Flint's struggles with its water supply has been well-documented in local circles, but is now getting some national attention.

Rachel Maddow of MSNBC hosted a segment on her show Friday that outlined the timeline of everything that's happened in Flint over the past 17 months. She also spoke about governor Rick Snyder's legislation calling for the appointment of managers as he sees fit.

Maddow said that Snyder's appointment of emergency managers in Flint was directly responsible for the crisis that saw rising levels of lead in drinking water when the city switched from the Detroit water supply to the Flint River.

"Michigan made a decision with Rick Snyder a few years ago to do something very, very radical to the way we govern ourselves as Americans, something that nobody else has done," Maddow said about the emergency manager law.

Flint mayor Karen Weaver declared a state of emergency this week after new blood test results showed that 21 and nine adults had elevated lead levels in their blood.

"This is the personal health equivalent of getting shot," Maddow said. "This is not something that happened over a long period of time. They flipped a switch to turn off the spigot last April and turn on a different spigot. The spigot they turned on poisoned the . The kids of Flint, Michigan have been poisoned by a policy decision.

"Is Flint habitable anymore?" Maddow asked.

Test results also showed that lead levels in the water are lower now than they were over the summer, before Flint switched back to Detroit's water supply in October.

"In Flint, remember what this problem is technically — corrosion by that river water that came through," Maddow said. "The pipes are scoured out by untreated river water. Who knows how long they're going to keep leaching lead."

Genesee County had earlier declared a public health emergency in the area and told residents not to drink unfiltered tap water. FEMA delivered about 7,400 gallons of bottled water to a local bank this week.

"Michigan made a decision with Rick Snyder a few years ago to do something very, very radical to the way we govern ourselves as Americans, something that nobody else has done," Maddow said. "Now we're getting in the first results of what they have done. I did not expect those to be blood test results from kids, but that's what they are, that's what Rick Snyder did.

Mayor pins Flint's hopes on water disaster declaration

http://www.mlive.com/news/flint/index.ssf/2015/12/flint_mayor_karen_weaver_pin_h.html

By Ron Fonger | rfonger1@mlive.com
on December 20, 2015 at 5:00 AM, updated December 21, 2015 at 8:53 AM

FLINT, MI -- The federal government may have never recognized a man-made water crisis like Flint's as a disaster before, but asking for the assistance has been Mayor Karen Weaver's plan since before she was elected Nov. 3.

"Our city is in a crisis -- a water crisis," Weaver said. "So far, what we've had are Band-Aid fixes, (and) it's not enough ... I don't see any other option."

On Monday, Dec. 21, the mayor plans to meet with Genesee County Board of Commissioners Chairman Jamie Curtis and others involved in emergency planning to discuss the city's incident response plan, a step-by-step outline aimed at addressing the water crisis.

"Things are falling together nicely," she said Friday, Dec. 18. "(The plan) is going to say, 'We need this, this and this,' and attach numbers where we can."

The Michigan Emergency Management Act outlines the process for seeking federal disaster assistance, which starts with the local declaration of a state of emergency. In that statement, a local jurisdiction says it has sustained widespread or severe damage, injury or loss of life.

Communities that have typically been granted disaster aid have suffered from natural disasters such as severe storms, flooding and fires, but Weaver believes that Flint's disaster with lead in its water is just as devastating.

There are cases in which less-common disasters have been recognized with federal aid, including one for severe hardship to the salmon industry in Alaska in 1953, a chlorine barge accident in

Louisiana in 1962 and dam failure in Colorado in 1973, according to FEMA records.

"The president can declare an emergency or major disaster for any natural or manmade event that the president determines has caused damage of such severity that it is beyond the combined capabilities of state and local governments to respond," FEMA spokesman Mark J. Peterson said in an email to The Flint Journal-MLive, "We're being positive and optimistic" with Flint's application, Weaver said.

The city's state of emergency says, "Flint children have experienced increased blood lead levels since the switch to the Flint River, and this damage to children is irreversible and can cause effects to a child's IQ ... (resulting) in learning disabilities and the need for special education and mental health services and an increase in the juvenile justice system."

Weaver has so far not assigned a dollar figure to damage done to children who drank Flint River water since April 2014, and she said this week that Flint's old water distribution system was also damaged by corrosive river water. "So that's where we are (also) going to need some help."

Although Flint City Council members have been generally supportive of Weaver seeking the disaster declaration, and the Michigan Legislative Black Caucus is supporting the request, Flint City Councilman Josh Freeman said he doesn't believe it will be granted.

"It's giving false hope to people that the problem is going to fixed" with a disaster declaration, Freeman said. "At some point we have to stop playing politics and start governing."

The councilman said state and federal officials are unlikely to send disaster relief to Flint because other parts of the county and the state have childhood blood lead levels -- from all sources -- that are similar to children in Flint.

"Maybe I'm wrong. Hopefully I'm wrong," he said.

FEMA's Web site shows 77 disaster declarations nationwide so far in 2015 and eight current disasters.

The current declarations cover damage caused by fire in California; severe storms and flooding in Wyoming; straight-line winds, flooding and severe storms on the Pine Ridge Indian Reservation in South Dakota; severe storms, tornadoes, straight-line winds and flooding in Texas; severe storms, tornadoes, straight-line winds and flooding in Oklahoma; severe storms, tornadoes, straight-line winds and flooding in Arkansas; and severe storms and flooding in South Carolina.

To reach the desk of President Obama, Weaver's disaster declaration must be approved by county Chairman Curtis and both officials must determine that the disaster is beyond the capabilities of the city or county to handle. Curtis has said he is "fully on board" to do whatever he can to help the city of Flint.

In Michigan, all requests for assistance are channeled through the Michigan State Police, Emergency Management and Homeland Security Division. The MSP reviews requests and makes recommendations to the governor, according to Ron Leix, a spokesman for the division.

The governor has the authority to mobilize state agencies to provide assistance, and if the state cannot cope with the disaster, Gov. Rick Snyder could request assistance through FEMA.

The federal agency makes disaster recommendations to the president.

State Rep. Sheldon Neeley, D-Flint, urged Snyder to get Flint's application for help to the president as quickly as possible.

"Issuing a health emergency is the most responsible thing to do," Neeley said in a news release. "This is a public health crisis, and our children are most at-risk. A state-declared health emergency will allow the city to access federal funding."

Will the water in Flint, Michigan, ever be safe again?

Michigan environmental agency head is "concerned" but won't apologize to Flint residents for tainted water

December 21, 2015 12:30PM ET

by Lori Jane Gliha & Sameen Amin

FLINT, Mich. – The head of Michigan's Department of Environmental Quality says he hasn't regained the public's trust after a water crisis in the city of Flint left tens of thousands of residents at risk of lead exposure.

Dan Wyant, the director of MDEQ, told America Tonight that his agency, which is tasked with ensuring safe drinking water in Michigan, must provide more transparency when it comes to the state's water testing processes.

"We all need to do better … the state, the city and the federal government, our partners at [the Environmental Protection Agency]," he said. "And we have a plan in place that is addressing the issue that will eliminate the lead exposure and ensure safe drinking water in Flint."

Wyant said the governor's 10-point plan, which includes offering water filters, lead education and water testing to Flint residents, will provide short-term and long-term relief.

"It's important that we recognize Flint deserves safe drinking water, and we're committed to ensuring that is the case," Wyant said. "What is at issue is lead-service lines [and] lead fixtures."

While many have pointed the finger at the state for the problems in Flint, Wyant stopped short of offering a public apology to residents.

"I recognize Flint is anxious and concerned about [the water situation]," he said "and I feel the plan that we have addresses the issue, and we're committed to seeing that plan through."

Wyant has also made changes to his department in the wake of the Flint water crisis while the department is under review. In an exclusive interview, he told America Tonight that he reassigned the department's chief of drinking water and municipal assistance, Liane Shekter Smith, to a new post. She now helps process Freedom of Information Act requests, despite the fact that some requests will likely pertain to her own actions, internal records and involvement in the Flint crisis.

Many Flint residents, health officials and clean-water advocates blame MDEQ for failure to adequately treat the water and protect an already vulnerable population from lead exposure.

Marc Edwards, a civil engineer who specializes in water treatment, said the state should have taken the public health risks more seriously by using corrosion control. The chemical treatment would've better protected the lead service lines that transport water to people's homes throughout the city, he said.

“If ever we don’t put chemicals in the water to keep the lead on the pipe and out of the water, it’s going to leach into the water,” he said. “We know from history that this can cause death, it can cause miscarriages, it can cause elevated blood lead – all kinds of health effects from that particular source of lead.”

In October, Edwards, a Virginia Tech professor who won a National Science Foundation grant to research the water situation in Flint, uncovered internal government documents, including emails and memos, that showed the state reacted slowly despite being aware for months of the EPA’s “concern about the lead situation in Flint” and that at least one EPA lead expert expressed a “major” public health concern about the lack corrosion control to keep the public safe. He has documented his work and findings at a website named the Flint Water Study.

During an October press conference, Wyant held assured the public the state was using corrosion control, but later said his statement was false.

“Corrosion control is a term of art and there are multiple control techniques,” he told America Tonight. “I want to be real clear: Flint needed more corrosion control, and we understand that and optimizing corrosion control is necessary and its part of what we’re doing to address the issue going forward.”

Edwards, who was first contacted by a local mother in April 2015, said the state also ignored worries from the public and water safety guidance from his independent team of researchers at Virginia Tech.

“The kindest thing you could possibly say is they were completely incompetent, sloppy, lazy and uncaring,” he said. “I think it goes a little bit beyond that, frankly.”

Edwards’ team, which received its grant in September, is independently testing hundreds of Flint homes for lead exposure. It has consistently found significantly higher levels of lead exposure when compared with testing overseen by the state.

Wyant said the state's testing methods were EPA-approved, but he said he now believes the protocol wasn't protective of public health.

"We recognize changes need to be made, but we are committed … to solving this problem," Wyant said. "And we'll stay through this action plan that addresses lead exposure to ensure that Flint has safe drinking water."

Curt Guyette, who works as an investigative reporter for the American Civil Liberties Union in Michigan, said the state downplayed the severity of the problem for months without taking action.

"They knew that it was a potential problem and their response was, 'People can just relax,'" he said. "That, to me, is unconscionable."

In November, the ACLU of Michigan announced plans for a federal lawsuit against the City of Flint and the State of Michigan for failure to protect Flint citizens.

The state is now being audited by the Environmental Protection Agency and reviewed by a bipartisan state task force.

Local officials representing the city of Flint, which was under the control of a state-appointed emergency manager during the crisis, declined to comment on questions regarding its actions during the water crisis, citing pending litigation.

Guyette said a complete, independent investigation is necessary to find out how an entire city was put at risk.

"I don't think there's any doubt that there was negligence here," Guyette said. "The question at this point is: Was there gross negligence?"

December 21, 2015 12:30PM ET by Lori Jane Gliha & Sameen Amin

Michigan environmental agency head is “concerned” but won't apologize to Flint residents for tainted water

FLINT, Mich. – The head of Michigan's Department of Environmental Quality says he hasn't regained the public's trust after a water crisis in the city of Flint left tens of thousands of residents at risk of lead exposure.

Dan Wyant, the director of MDEQ, told America Tonight that his agency, which is tasked with ensuring safe drinking water in Michigan, must provide more transparency when it comes to the state's water testing processes.

"We all need to do better … the state, the city and the federal government, our partners at [the Environmental Protection Agency]," he said. "And we have a plan in place that is addressing the issue that will eliminate the lead exposure and ensure safe drinking water in Flint."

Wyant said the governor's 10-point plan, which includes offering water filters, lead education and water testing to Flint residents, will provide short-term and long-term relief.

"It's important that we recognize Flint deserves safe drinking water, and we're committed to ensuring that is the case," Wyant said. "What is at issue is lead-service lines [and] lead fixtures."

While many have pointed the finger at the state for the problems in Flint, Wyant stopped short of offering a public apology to residents.

"I recognize Flint is anxious and concerned about [the water situation]," he said "and I feel the plan that we have addresses the issue, and we're committed to seeing that plan through."

Wyant has also made changes to his department in the wake of the Flint water crisis while the department is under review. In an exclusive interview, he told America Tonight that he reassigned the department's chief of drinking water and municipal assistance, Liane Shekter Smith, to a new post. She now helps process Freedom of Information Act requests, despite the fact that some requests will likely pertain to her own actions, internal records and involvement in the Flint crisis.

Exclusive: Flint water chief reassigned, helping with FOIA requests

Many Flint residents, health officials and clean-water advocates blame MDEQ for failure to adequately treat the water and protect an already vulnerable population from lead exposure.

Marc Edwards, a civil engineer who specializes in water treatment, said the state should have taken the public health risks more seriously by using corrosion control. The chemical treatment would've better protected the lead service lines that transport water to people's homes throughout the city, he said.

"If ever we don't put chemicals in the water to keep the lead on the pipe and out of the water, it's going to leach into the water," he said. "We know from history that this can cause death, it can cause miscarriages, it can cause elevated blood lead – all kinds of health effects from that particular source of lead."

In October, Edwards, a Virginia Tech professor who won a National Science Foundation grant to research the water situation in Flint, uncovered internal government documents, including emails and memos, that showed the state reacted slowly despite being aware for months of the EPA's "concern about the lead situation in Flint" and that at least one EPA lead expert expressed a "major" public health concern about the lack corrosion control to keep the public safe. He has documented his work and findings at a website named the Flint Water Study.

During an October press conference, Wyant held assured the public the state was using corrosion control, but later said his statement was false.

"Corrosion control is a term of art and there are multiple control techniques," he told America Tonight. "I want to be real clear: Flint needed more corrosion control, and we understand that and optimizing corrosion control is necessary and its part of what we're doing to address the issue going forward."

Edwards, who was first contacted by a local mother in April 2015, said the state also ignored worries from the public and water safety guidance from his independent team of researchers at Virginia Tech.

"The kindest thing you could possibly say is they were completely incompetent, sloppy, lazy and uncaring," he said. "I think it goes a little bit beyond that, frankly."- Marc Edwards, Civil engineer specializing in water treatment.

Edwards' team, which received its grant in September, is independently testing hundreds of Flint homes for lead exposure. It has consistently found significantly higher levels of lead exposure when compared with testing overseen by the state.

Wyant said the state's testing methods were EPA-approved, but he said he now believes the protocol wasn't protective of public health.

"We recognize changes need to be made, but we are committed … to solving this problem," Wyant said. "And we'll stay through this action plan that addresses lead exposure to ensure that Flint has safe drinking water."

Curt Guyette, who works as an investigative reporter for the American Civil Liberties Union in Michigan, said the state downplayed the severity of the problem for months without taking action.

"They knew that it was a potential problem and their response was, 'People can just relax,'" he said. "That, to me, is unconscionable."

In November, the ACLU of Michigan announced plans for a federal lawsuit against the City of Flint and the State of Michigan for failure to protect Flint citizens.

The state is now being audited by the Environmental Protection Agency and reviewed by a bipartisan state task force.

Local officials representing the city of Flint, which was under the control of a state-appointed emergency manager during the crisis, declined to comment on questions regarding its actions during the water crisis, citing pending litigation.

Guyette said a complete, independent investigation is necessary to find out how an entire city was put at risk.

"I don't think there's any doubt that there was negligence here," Guyette said. "The question at this point is: Was there gross negligence?"

Virginia Tech researcher accuses state health officials of "hiding" data on Flint's water

http://michiganradio.org/post/virginia-tech-researcher-accuses-state-health-officials-hiding-data-flints-water#stream/0

Virginia Tech researchers accuse Michigan health officials of trying to “stonewall” the investigation into lead in Flint’s drinking water.

The documents obtained through a Freedom of Information Act request are available online.

Marc Edwards says newly obtained internal documents show Department of Health and Human Services employees tried to hide evidence that matched the increased lead levels in children found by doctors at Hurley Medical Center.

“There are emails that show they reproduced the Hurley analysis very early on, and in a document they said is not to be distributed to the public, they noted they found the same thing as Hurley but they didn’t tell anyone,” says Edwards.

Edwards says state health department officials were following the lead of the Michigan Department of Environmental Quality in the handling of Flint’s water crisis.

The MDEQ initially downplayed the importance of the data from Virginia Tech and Hurley Medical Center.

The data suggested elevated lead levels, in the drinking water of some Flint homes and the blood of Flint children, could be linked to the city’s switch from Detroit water to the Flint River in April, 2014. Researchers claim the corrosive nature of the river and a lack of treatment resulted in damage to pipes, which then started leeching lead into the drinking water.

After 18 months, the city switched back to Detroit water in October. However, there is still concern lead may continue to be a problem, and Flint residents are advised to continue using filters or drink only bottled water.

There is no safe level of lead. Exposure to lead can have serious health effects, especially in young children.

The Department of Health and Human Services issued a written statement this afternoon defending the agency's handling of the blood lead level data. In the statement, the agency insists it "consistently provided information regarding blood lead levels in the city of Flint."

When initially looking at the citywide and county elevated blood lead level numbers, the increase appeared to be consistent with the routine seasonal fluctuation seen in the summer months. It wasn't until the Hurley report came out that our epidemiologists took a more in-depth look at the data by ZIP code, controlling for seasonal variation, and confirmed an increase outside of normal trends. As a result of this process, we have determined that the way we analyze data needs to be thoroughly reviewed. Additionally, Gov. Rick Snyder has created a Flint Water Task Force to review all city, state and federal responses and actions and is expected to make recommendations moving forward.

The statement went on to say DHHS will continue to work to ensure "appropriate case management and follow up is occurring in Flint."

Who's responsible for poisoning Flint's water supply?

http://america.aljazeera.com/opinions/2015/12/whos-responsible-for-poisoning-flints-water-supply.html

The struggling Michigan city is reeling from a lead-poisoning crisis caused by bad state policies

December 19, 2015

In October, Michigan Gov. Rick Snyder announced that the city of Flint would change its water source. This was in response to the discovery that temporarily pulling water from a local river produced high levels of lead in the water supply for Flint, aneconomically struggling community of 100,000 residents roughly an hour northwest of Detroit.

It was a crisis months in the making. Problems began as soon as officials decided in April 2014 to have Flint stop using Detroit's water system and begin drawing water from the Flint River.

This was billed as a measure that would save millions of dollars. But residents almost immediately raised concerns about the discolored and smelly water that was flowing from their taps. Tests revealed high levels of chemicals that could cause liver or kidney problems, and some complained of losing hair and getting rashes after drinking the water.

In response to the growing backlash and the evidence that residents were drinking poisoned water, state and city officials sought to quell concerns, insisting the water was safe to drink and continually disputing local studies published this fall that showed lead levels sharply increased in the bloodstreams of Flint residents, including children. (Research suggests that lead can cause irreversible cognitive and developmental damage to children.)

But even as Snyder and other state officials relented, a question has continued to linger among activists and residents with children who could face life-altering circumstances as a result of lead poisoning: Who's to blame for this mess?

At the October announcement that Flint would switch back to Detroit's water system, Snyder made clear that he was interested solely in finding a solution to fix the problem, not in revisiting mistakes. Nonprofit donations, along with appropriations from the state and city, would pay for the $12 million transition back to Detroit's system, he said.

"This isn't about blaming anyone," he said, "but are there recommendations to improve processes when you change water sources or are there ongoing things we should be looking at on a more frequent basis?"

Snyder is not the only official involved in the decision-making process to deflect blame.

At the time of the switch, Darnell Earley was Flint's state-appointed emergency manager, with near total control of day-to-day operations. He was the third appointee to oversee the financially unstable city since 2011. According to a letter obtained by the American Civil Liberties Union of Michigan, it was Earley who made the final call.

But he asserts he's not to blame. He claims the plan was presented to him by the city's mayor, Dayne Walling, and staff members after Earley was appointed in October 2013. Walling, who was defeated last month in his re-election bid, has said that's not the case. The head of Flint's Department of Public Works at the time, Howard Croft, claimed the decision came down from Snyder's office. Meanwhile, officials with the Michigan Department of Environmental Quality simply said that staffers applied the wrong federal standards to treat water from the Flint River, despite a 2011 study that showed residents would be at risk of lead contamination if the water supply wasn't treated properly. Asked about the report, a representative for the department told The Detroit Free Press to ask Flint officials why the recommendations were ignored.

"There are really no models on how to clean up a mess like this, especially given that none of the authorities have proven trustworthy."- Marc Edwards, Professor, Virginia Tech.

Snyder appointed a task force to issue what he characterized as an "after-action" report on what took place, though no completion date is set. It's unclear what, if anything, might result from the report.

The perceived lack of accountability from activists and residents is the motivating factor behind a federal lawsuit that was filed last month by several families who have accused more than a dozen state and city officials of negligence, said attorney Julie Hurwitz.

"The various and sundry statements of positions being taken by the players in this entire travesty is so overwhelmingly broad," she said, "that it's frankly hard to keep track of all the various ins and outs and nuances and positions that … these culprits are publicly taking from one day to the next."

Hurwitz added that the lawsuit, which she aims to make a class action, is intended to establish "some semblance of accountability for the wrong that was done."

Marc Edwards, a Virginia Tech professor and MacArthur genius grant recipient who helped lead an independent study of Flint's water supply with residents and the ACLU, said the situation has reached "uncharted territory."

"I never heard of a situation where the agencies … responsible for preventing this problem caused it … There are really no models on how to clean up a mess like this, especially given that none of the authorities have proven trustworthy," he said.

Months after acknowledging that lead levels in Flint's water supply increased, the state's only response so far has been to reassign an official with the environmental department and appoint a task force whose broad purpose is to "offer recommendations for future guidelines to protect the health and safety of all state residents." Croft has resigned.

As recently as last week, Snyder refused to call the task force's review an investigation. He again declined to set a deadline for completion of the review.

Flint residents have seen marked improvements, as Detroit's water system has flushed out what's left of the Flint River in the city's supply. But that hasn't allayed the concerns of city officials and residents still reeling from the fact that their water supply was poisoned on the state's watch.

Hours after Snyder struck an optimistic tone on the situation in Flint, the Federal Emergency Management Agency announced it was sending 28,000 liters of bottled water to the city.

And at a City Council meeting later that evening, newly elected Mayor Karen Weaver declared a state of emergency, a move that highlights the urgency many still feel is needed to address the situation. Her resolution doesn't mince words when describing the horrifying reality Flint parents may face with their kids, and it nods to the source of the city's crisis. It's a source she can address only in broad strokes.

"The city of Flint," she said, "has experienced a man-made disaster by switching to the use of the Flint River." It's a disaster that's unlikely to end anytime soon.

How the Flint, Michigan, water crisis is affecting its poorest residents

http://america.aljazeera.com/watch/shows/america-tonight/articles/2015/12/18/flint-michigan-water-crisis-lead-residents.html

As residents await possible government disaster aid, how does their city recover?

FLINT, Mich. — A bottle of murky tap water — with swirling rust-colored pieces of sediment — still sits on Rhonda Kelso's kitchen counter in Flint.

In August of this year, despite information from government officials suggesting the water in Flint was safe to drink, she was still skeptical of its quality. So she collected the sample from her tap.

When a group of Virginia Tech researchers tested Kelso's water and discovered evidence of lead, Kelso, a 52-year-old stroke survivor, decided that was the last straw.

Now she's part of a class-action lawsuit filed **against Flint, the state of Michigan and various officials that claims the government is responsible for exposing** tens of thousands of Flint residents to lead-contaminated water**.**

In December **the mayor declared a state of emergency in Flint.**

"The city of Flint residents — they are not people that are disposable. We just are not," said Kelso, as tears welled in her eyes. "We're not a permanent underclass."

Water history

Before the discovery of lead in the water, Flint residents endured several months of irritating health problems, including hair loss and rashes, after the city started using the Flint River as a source for drinking water in April 2014.

For years, the community had sourced its water from Lake Huron by purchasing it from Detroit. The temporary switch was designed to save the cash-strapped city more than $3 million, but the corrosive nature of the Flint River did more harm than good.

Without adequate controls in place to protect the aging plumbing infrastructure throughout the city, the water started to eat away at the pipes. As a result, lead from the pipes leached into the water and worked its way into people's homes.

Kelso, who uses a cane to get around, is most concerned for her 12-year-old daughter, Kaylynn, who is developmentally delayed and has a heart condition.

"It was almost a year before I got my own filter," Kelso said. "So we were drinking the water. We were exposed. We were cooking with the water."

In October, the state said it would provide water filters and water testing to Flint residents. **It also** pledged more than $9 million **to help switch the Flint water system back to the Lake Huron source.**

However, for a financially troubled city with nearly 42 percent living in poverty, **the ongoing lead crisis is a mounting burden as people struggle to make ends meet.**

An impact "we see later"

Amber Whitman uses bottled water by the gallon when she cooks dinner for her fiancé, her grandmother and her 7-year-old daughter.

Flint residents have been urged to use certified filters to protect themselves while the city and state continue to work with the Environmental Protection Agency to ensure the water for all Flint citizens is safe to drink.

Whitman, who is pregnant, has yet to install the government-provided filter on her faucet, so she uses water from a jug on macaroni-and-cheese night. It is an extra expense she is trying to manage while she's not working.

"The city of Flint residents – they are not people that are disposable; we just are not. We're not a permanent under-class." - Rhonda Kelso, Flint resident.

"We were already having trouble trying to purchase just food, and now what little assistance I had from the state has to completely go towards water," she said. "In the meantime, our water bill — even though we're not using it — is like $120 a month."

Whitman said she uses food stamps to pay for the bottled water. Though health officials have said it is not dangerous to take showers, she isn't taking any chances.

"We are no longer doing hot showers. It's lukewarm or cool water to shower," she said, saying she worries about the long-term effects of lead exposure on her little girl. "I think it

would concern any parent because most of the damage that is caused from lead is irreversible.”

Dr. Mona Hanna-Attisha, the director of the pediatric residency program at Flint’s Hurley Hospital, said it's impossible to know the extent of the problem. She’s assuming every child in Flint has been exposed at some point, starting in April 2014 and until the water is safe again.

“The impact of lead poisoning we see later,” she said. “So, in five years, we’re going to have more kids who need early intervention and special education services. And in 10 years, there’s going to be more kids with ADHD diagnoses. And in 15 to 20 years, there’s going to be more kids with violent behavior … We don’t see the effects now.”

Michigan Ignored 'Conclusive Evidence' Of Flint Lead Poisoning, Researcher Says

http://www.huffingtonpost.com/entry/flint-michigan-water-lead_56784055e4b0b958f657595c

The state says it made an honest mistake.

12/21/2015 05:34 pm ET

Arthur Delaney Senior Reporter, The Huffington Post

Paul Sancya/Associated Press

Michigan state officials insisted that the water supply in Flint was safe even though they knew an unusual number of children had suffered lead poisoning, according to a scientist who helped blow the whistle on Flint's water crisis.

Through a public records request, Marc Edwards, a civil engineering professor at Virginia Tech, uncovered a July 2015 memo warning of elevated lead levels in Flint kids' blood.

An internal report from the Michigan Department of Health and Human Services warned that lead poisoning rates "were higher than usual for children under age 16 living in the City of Flint during the months of July, August and September, 2014."

In April 2014, city and state officials switched Flint's water source from Detroit's water system to the Flint River, immediately prompting citizen complaints about tap water quality.

Edwards led a team that conducted its own analysis of Flint's water, reporting high lead levels in early September of this year. Brad Wurfel, spokesman for the Michigan Department of Environmental Quality, essentially dismissed the allegations in an interview with Michigan Radio, saying the state's analysis of blood data didn't show any signs of a problem.

The government continued to insist that the water was safe until a Flint pediatrician with the Hurley Medical Center reported later in September that the water change corresponded with a significant spike in lead poisoning among city children.

However, the memo obtained by Edwards suggests the state knew about the lead poisoning weeks earlier, yet continued to say the water was okay.

"They discovered scientifically conclusive evidence of an anomalous increase in childhood lead poisoning," Edwards wrote Monday on the website he created to track Flint's water crisis, "but stood by silently as MDEQ officials repeatedly and falsely stated that no spike in blood lead levels (BLL) of children had occurred."

Reached for comment on Monday about the memo, Michigan's DHHS said it had made an honest mistake by attributing the spike in blood lead levels to seasonal variation.

"When initially looking at the citywide and county elevated blood lead level numbers, the increase appeared to be consistent with the routine seasonal fluctuation seen in the summer months," agency spokeswoman Jennifer Eisner said in an email. "It wasn't until the Hurley report came out that our epidemiologists took a more in-depth look at the data by zip code, controlling for seasonal variation, and confirmed an increase outside of normal trends."

The July 2015 memo didn't indicate definitively what had caused the higher lead levels in the children's blood, nor did it show elevated lead for subsequent months. Other emails obtained by Edwards indicate that the data had been sent to the director of the DHHS, as well as to the office of Gov. Rick Snyder (R), sometime between July and September.

The county declared a public health emergency and told people to stop drinking the water in October of this year. And Snyder, who appointed emergency managers overseeing the city's switch to the Flint River as its water source, has signed legislation returning Flint to Detroit's water system. The governor also appointed a task force to investigate what went wrong.

Lead poisoning can cause irreversible health and behavioral problems, and children exposed to too much lead can permanently lose IQ points.

Listen to "Not Safe to Drink," a special documentary about the Flint water crisis

Michigan Drinking Water Crisis Shows Limits Of EPA Lead Rule Changes (Inside EPA)

http://insideepa.com/inside-epa/michigan-drinking-water-crisis-shows-limits-epa-lead-rule-changes

Posted: December 22, 2015

The drinking water crisis in Flint, MI, is highlighting the potential shortcomings of EPA regulations in preventing lead increases when a water system changes the source of its water, with sources saying that even recommended changes to the lead and copper rule (LCR) may not be enough to prevent a similar situation in the future.

Flint Mayor Karen Weaver declared a state of emergency Dec. 14 for the city due to the elevated levels of lead in drinking water, which have sickened many infants and children, after the city switched its water source from the Detroit water system to the Flint River in 2014. The city has since switched back to Detroit's water.

The declaration comes after several residents filed a class action suit Nov. 13 that charges state and local officials knew that switching drinking water sources would increase lead levels, and after a coalition of environmental and other advocacy groups Nov. 16 issued a notice of intent to sue the same officials, alleging that they failed to properly implement EPA-mandated lead testing and corrosion control programs in Flint.

An EPA task force is working with the state and local officials to address the problem while Region 5 has launched a "full programmatic review" of Michigan drinking water programs. Region 5 Administrator Susan Hedman said in a Nov. 10 statement that the review will target the Michigan Department of Environmental Quality's (MDEQ) overall implementation of the Safe Drinking Water Act (SDWA) mandates as well as specific standards for total coliform and nitrates, EPA's LCR, and groundwater policies.

EPA's National Drinking Water Advisory Council (NDWAC) is recommending a number of changes to the LCR to further reduce national exposure to lead in drinking water, but the advisors said in November that the Flint crisis primarily was due to a failure to follow current LCR requirements for corrosion control testing. NDWAC included language in an "enhancement" letter to EPA Administrator Gina McCarthy along with the recommendations that says that "prior to the adoption of the new rule, compliance with the existing rule is essential" (*Inside EPA*, Nov. 27).

Under both the current rule and the recommended changes, water systems are not specifically required to conduct any additional testing when they switch water sources, although such testing is advised.

"When a system changes its source or treatment, and is required to consult with the state, the state primacy agency also may choose to require additional one-time monitoring to evaluate those changes if the degree of the change warrants," the draft NDWAC recommendation states. Some drinking water sources are more corrosive than others, increasing the likelihood that lead and copper from water pipes will leach into treated water.

MDEQ did not require the one-time monitoring, and one source with knowledge of the LCR process suggests that was one key mistake in Flint.

"I think everybody's culpable here," the source says. "It makes sense that the state primacy agency should have been involved. . . . The primacy agency does have a role to play, and there should have been some consultation, one would think. If I were creating a water supply, I'd consult with a water agency. They may have, and they may not have."

But the source acknowledges that the intent of the LCR was meant to monitor lead over time. "I don't know that there's an up-front testing requirement" in the rule for a circumstance like Flint, where the water source was switched, the source says. "Part of that gets left to the engineers to say, 'if our water source is going to be x, it's our obligation to do the work up front to figure out [if that will have lead]."

"We know lead is in the plumbing, we know how it gets mobilized, we know a lot about those factors, so in the case of Flint, one has to wonder how much testing was done to determine if there was potential" for contamination, the source says.

Rep. Dan Kildee (D-MI), who represents Flint, suggested at the Nov. 18 NDWAC meeting that EPA should not be left off the hook for the Flint crisis, particularly as it looks to finalize the new LCR.

"Ultimately, EPA has responsibility to ensure clean drinking water standards were followed. This rule must have greater transparency. Residents deserve to know why, for months, Michigan failed to follow federal safe drinking water laws," Kildee told the panel. He added that he hoped EPA Region 5's audit of MDEQ's implementation of SDWA could be included in revisions to the rule.

In the class action suit, *Melissa Mays, et al. v. Rick Snyder, et al.*, the plaintiffs allege that state and local officials deprived citizens of their 14th Amendment rights "in that they deprived plaintiffs of life, liberty and property without due process of law when they took from plaintiffs safe drinking water and replaced it with what they knew to be a highly toxic alternative solely for fiscal purposes." The suit is pending in the U.S. District Court for the Eastern Division of Michigan. *The suit is available on InsideEPA.com. (Doc. ID: 187372)*

The plaintiffs claim officials knew that the water pumped from the Flint River exposed residents to heightened levels of lead, based on a 2013 MDEQ report which warned that the Flint River water was highly corrosive and could not be safely used without an anti-corrosive agent that would prevent lead and copper from leading into the water lines: "Beginning in April 2014, Defendants were fully aware that the required and necessary anti-corrosive was not being used during the distribution of Flint River water to Flint residents, families and homeowners," the plaintiffs write, adding that the daily cost of such an anti-corrosive agent would have been $60.

But in addition to the lack of an anti-corrosive agent, many observers have charged that MDEQ's oversight of Flint was insufficient and that both Flint and MDEQ officials failed to follow EPA rules for monitoring lead levels, including SDWA sampling procedures and the LCR mandate to implement a strategy to reduce corrosion of its drinking water pipes.

A spokesman for EPA Region 5 noted in a recent email to *Inside EPA* that Mayor Weaver had met with Region 5 and MDEQ officials Dec. 11, prior to the state of emergency declaration. -- *Amanda Palleschi*

U.S. Rep. Dan Kildee, D-Flint Township, meets with The Flint Journal Editorial Board on Tuesday, Dec. 22, 2015.Jake May | MLive.com

FLINT, MI -- As questions continue to swirl about who should be held responsible for the Flint water crisis, U.S. Rep. Dan Kildee said the state needs to step forward and fund a program to benefit the health of the city's youngest residents.

Kildee, D-Flint Township, continued to call for a state-financed program during a Tuesday, Dec. 22, meeting with The Flint Journal editorial board that would be used to continually monitor potential health ramifications for those exposed to elevated lead levels in the city's water supply.

News organizations from around the country have brought a renewed spotlight to the city's water issues after newly-elected Mayor Karen Weaver called declared a state of emergency.

However, Kildee said not enough focus has been paid to helping those potentially harmed by the water woes.

"My focus is on getting the kids help," Kildee said, adding that such a health fund would be unprecedented.

Kildee said he has met with members of the medical community, including Dr. Mona Hanna-Attisha, the director of Hurley Medical Center's Pediatric Residency Program, whose initial research first showed rising levels of lead in the blood of Flint children, to try and develop a medical response to what he called a "failure of government."

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply. Even though the city reconnected to the Detroit water system in October, local officials have advised Flint residents not to drink city water unless they are using a lead-clearing filter.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children under 5 years old from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

My focus is on getting the kids help.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase."

The Centers for Disease Control and Prevention says children under 6 are among those at high risk for the effects of lead poisoning. U.S. Census Bureau estimates show there are between 6,000 and 8,000 children under 5 in the city.

Though funded by the state, Kildee said the health fund would be managed locally.

State officials say they have been active in their response to the situation, and pointed to Gov. Rick Snyder's creation of a five-member task force in October charged with reviewing the response to the water crisis and making recommendations.

"We are committed to protecting the health of children in Flint now and into the future, and helping anyone who has been affected by the water challenges in Flint," said Snyder Press Secretary Dave Murray. We're already taking steps called for in Gov. Snyder's action plan, and are working with the Flint Water Task Force to see what additional actions it recommends to help children and adults and address any issues that were created b this situation."

However, some Democratic leaders have claimed the Republican-led state government hasn't done enough to address the situation in Flint.

U.S. Sen. Debbie Stabenow, who was in Flint Tuesday to announce potential new anti-blight funding, called on Lansing to take a larger role in tackling Flint's lead issue.

"The State of Michigan, where the negligence rose, has to step up in a much-bigger way to help Flint," Stabenow said.

Murray said the state is continuing to work with city leaders in addressing the issue and has offered $10 million in grants and other financial assistance to help facilitate the city's switch back to Detroit water, improve the city's water infrastructure and provide filters for residents.

"Flint residents need to have access to safe, clean water," Murray said. "Gov. Snyder and administration members continue to work closely with Mayor Weaver and other city leaders to focus on health issues affecting children and other city residents, and address water infrastructure challenges."

State failed to sound alarm when it knew of rising Flint blood lead levels (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/documents_show_state.html

By Ron Fonger | rfonger1@mlive.com
on December 22, 2015 at 5:55 PM, updated December 23, 2015 at 8:00 AM

FLINT, MI -- State officials found evidence of rising blood lead levels in Flint two months before the problem was exposed by a Flint pediatrician, but didn't immediately inform the public, according to documents released by a water researcher.

Michigan public health officials said today, Dec. 22, that they did not sound an alarm about the spike, which coincided with use of the Flint River for drinking water, because they initially believed the numbers represented a "seasonal fluctuation."

As a result of what happened in Flint, state officials now say that the way the state analyzes the data they collect needs to be "thoroughly reviewed."

Virginia Tech Professor Marc Edwards, a key figure in the Flint water crisis, released 159 pages of public records on his Web site this week, documents received in response to a Freedom of Information Act request to the state.

The records are a collection of emails and attachments, primarily from officials at the Michigan Department of Health & Human Services, about Flint water.

The documents show:

- Emails about blood lead levels in Flint date back to at least July 23 and by July 28, inner-office correspondence says the city's rising numbers warrant further investigation and that "there does appear to be a higher proportion of (elevated blood lead levels) last summer (2014) than usual."
- A report prepared by the state DHHS's Child Health Epidemiology Section, which included data up to July 27, concluded "positive tests for (elevated blood lead levels) were higher than usual for children under age 16 living in the city of Flint during the months of July, August and September 2014."
- A Sept. 11 email from Robert L. Scott of DHHS' Childhood Lead Poisoning Program tells others in the department that he has received a request for information about blood lead levels in Flint. "Sounds like there might be more to this than what we learned previously. Yikes," the email says.

Edwards said today, Dec. 22, that the documents show the state had evidence of elevated blood lead levels in Flint while the Michigan Department of Environmental Quality and the city of Flint denied a public health problem with lead in the city's water supply.

After Edwards reported his testing showed a serious problem with lead in Flint water, a DEQ spokesman questioned the credibility of his research and former Flint mayor Dayne Walling assured residents it was safe to drink until September when a Flint pediatrician reported her findings.

Those denials would not have continued as long as they did had state health officials told the public what it had discovered, the professor said.

"Everything they looked at, they found a problem, and they never told anyone," Edwards said of the agency.

Dr. Eden Wells, chief medical executive for the DHHS, said today that the documents do show missed opportunities for the state to have addressed Flint's lead in water crisis earlier, but do not show an effort to withhold information.

"I have done this a lot after (disease) outbreaks ... You always go back, and learn from them, (including whether evidence) could have allowed for an earlier response," she said.

Wells, who was named by Gov. Rick Snyder to be Flint's drinking water public health adviser, said state health officials initially concluded that spikes in blood lead lead levels immediately after the city changed its water source to the Flint River were seasonal and not related to water.

DHHS officials initially questioned the findings by a Hurley Medical Center pediatrician, Dr. Mona Hanna-Attisha, who on Sept. 24 showed blood lead levels of children in some parts of the city tripled after the switch to Flint River water.

The released emails show that on Sept. 28, in preparation for a news conference on Hanna-Attisha's findings, the director of the state health department said he needed an analysis of the Flint doctor's data and her conclusions.

"I would like to make a strong statement with a demonstration of proof that the lead blood levels seen are not out of the ordinary and are attributable to seasonal fluctuations," the email from DHHS Director Nick Lyon said.

Blood lead levels above 5 micrograms per deciliter are considered elevated by the Center for Disease Control and Prevention.

Wells said only after reviewing the state's own data further, examining it based on zip codes and focusing on young children, who are most susceptible to lead poisoning, could she conclude blood lead levels were rising among Flint children under 5 years old.

Jennifer Eisner, a spokeswoman for DHHS, said the department initially believed higher blood lead levels were due to seasonal fluctuations.

"As a result of this process, we have determined that the way we analyze data collected needs to be thoroughly reviewed," Eisner said in an email to The Flint Journal-MLive.

Wells was involved in a follow-up examination of state data after Hanna-Attisha made her research public in late September. Wells eventually agreed with the Flint doctor.

Edwards said he spent weeks in an effort to get access to state blood lead level data after testing of Flint water by Virginia Tech found lead levels in water rising as well.

The professor said he encountered resistance from state agencies in releasing blood lead data, delaying efforts to address the problem.

Edwards' experiments on the river water found it was far more corrosive than Lake Huron water that had been purchased from the Detroit water system and used in Flint for decades.

Flint reconnected to the Detroit system in October, using state, local and grant funds to end its use of the Flint River after 17 months.

State and federal reviews of how the Flint's water crisis was allowed to happen are ongoing.

New study links tainted water, high lead levels in kids in Flint, Mich. (CBS)

http://www.cbsnews.com/news/tainted-water-high-lead-levels-kids-flint-michigan/

A new study provides the strongest evidence yet of a link between elevated blood-lead levels in children living in Flint, Michigan, and the struggling city's water system, a pediatrician who first raised alarms about the matter said Monday.

Dr. Mona Hanna-Attisha, director of pediatric residency at Hurley Children's Hospital, and other experts compiled the report using a more refined analysis. It showed that areas in Flint with the highest levels of lead in tap water corresponded with where young children with the highest blood-lead levels lived.

The study also confirmed her earlier assessment that the percentage of children with abnormally high blood-lead levels had at least doubled after the city stopped tapping Detroit's water system to save money in 2014, and began using water from the nearby Flint River.

The findings "strongly implicate the water source change as the probable cause for the dramatic increase," according to the report published in the American Journal of Public Health. The report said the results probably understate the danger because testing is not conducted before birth and during infancy, when numbers likely would be higher. Screenings usually are performed between ages 1 and 2.

"Everybody who drank this water or cooked with this water was exposed to lead," said Hanna-Attisha, the report's lead writer and an assistant professor at Michigan State University.

Flint and Genesee County have declared public health emergencies amid public outrage over the tainted water. Lead is a powerful toxin that can damage human nervous systems and is particularly harmful for young children, causing lower intelligence, developmental delays and behavior problems.

"Lead at any level can be associated with decreases in IQ, behavioral disorders, even an association with certain juvenile delinquency as these children get older," Dr. Eden Wells, Chief Medical Executive for the Michigan Department of Health and Human Services, told CBS News.

The city of about 99,000 residents started using the Flint River as an interim water source until it could hook up to a new system drawing water from Lake Huron that is scheduled for completion next year. The cost-cutting move was made while the city was under state emergency financial management.

But the river water drew complaints about its taste, smell and appearance.

Hanna-Attisha announced in September that data from blood tests routinely administered to young children showed that lead levels had jumped since the water systems were changed. State officials initially challenged, but later acknowledged, the findings, and Flint resumed using Detroit water. The state has approved millions of dollars in aid to address the crisis.

For their updated study, Hanna-Attisha and her colleagues refined their data, focusing specifically on children under age 5 within the city limits and excluding those who live outside the city but within Flint ZIP codes, where no significant changes in blood-lead levels were found.

The researchers found that the proportion of children with at least five milligrams of lead per deciliter - the point considered elevated - had risen from 2.4 percent in the nine months before the water switch to 4.9 percent in the nine months afterward.

In neighborhoods with the highest water lead levels, the increase was even bigger: to 6.6 percent. And in one section of town, the percentage of children with elevated levels went from 4.9 percent to 15.7 percent.

No reason for the higher blood-lead levels except the water was found, the study said.

Health problems from lead can be hard to spot in young children, said Dr. Marcie Billings of the Mayo Clinic Children's Center in Rochester, Minnesota, who did not participate in the study. But parents should watch for future red flags such as anemia, low academic achievement and unusual behavioral changes, she said.

Although lead exposure is irreversible and no level is safe, not every affected child will suffer the worst results, Hanna-Attisha said. Good nutrition can help the body excrete toxins instead of absorbing them. Effective early-childhood education and relief from stresses such as poverty and violence are important.

"We have an opportunity to build a model public health program so we don't see these consequences," she said.

Concerned families can visit their pediatrician's office or go to their local health department for free blood level testing. Medicaid pays for lead tests.

"We really worry about pregnant women and infants. We know that long-standing lead exposure can lead to some long-term effects," said Dr. Carlos Lerner, medical director of the Children's Health Center at the Mattel Children's Hospital UCLA,

4 lessons we must learn from the tragedy in Flint

The water supply in Flint, Mich., contains toxic levels of lead that are particularly harmful to children. The costs needed to begin to fix this led Flint Mayor Karen Weaver to declare a state of emergency in mid-December.

This is a tragedy—one that was entirely avoidable. The poisoning is the result of short-sighted changes by the government that were focused on saving money and that were made without adequate consideration of potential consequences. If we don't start addressing the underlying problems, there will likely be more Flints to come.

What happened in Flint?

Flint management decided to switch the city's water source from water supplied by Detroit to a new source from Lake Huron. But because the pipelines needed were a year and a half away from being completed, Flint residents were switched temporarily in April 2014 to cheaper water from the Flint River.

Changing drinking water sources isn't as simple as changing a budget number and flipping a switch. The pipes that deliver water within Flint—like the pipes in many cities throughout the U.S.—are old and made of or contain lead. The chemical makeup of the water from the Flint River makes it more corrosive than Detroit's water, causing lead to leach from the aging pipes, contaminating Flint's water with dangerous levels of lead.

A study presented in September by the Hurley Medical Center showed that blood lead levels in children under 5 years of age living in Flint zip codes that were supplied by the Flint River water increased dramatically in the year and a half that Flint's water was sourced from the Flint River. Further, the number of Flint children in those zip codes with dangerously elevated blood levels more than doubled in just that year and a half.

Lead is toxic, especially for children. Children exposed to lead face significantly increased risks of impaired brain development and cognitive functions, lower IQs, attention-related behavior problems, lower levels of academic achievement, and violent tendencies. Flint's children now face these risks.

We can't undo what happened in Flint. But we can learn from it and protect potentially millions of children throughout the U.S. Here are four lessons from Flint.

1. The drinking water infrastructure in the U.S. is aging to the point of danger. In Chicago, where I live, for example, some of the pipes that deliver drinking water to homes are 100 years old. We drink water from Lake Michigan that is treated for safety from chemicals and disease, but between the water treatment plant and our taps, that water runs through old pipes that can leach lead. Chicago is now replacing 900 miles of water mains in a process that will take 10 years. Today, we know better than to use lead pipes to transport water. But millions of people in the U.S. are still getting water from old lead pipes. Until those pipes are replaced, the lead hazard will remain.

2. Short-term budget "fixes" often cost more in the long-run. After the lead issue was discovered, Flint was hooked back up to Detroit's water supply for the short time left until the new Lake Huron pipelines are available. The cost to switch back is reported to be $12 million. In addition, there will be the costs of testing, monitoring and treating Flint's children. These costs are what led Flint's mayor to seek federal disaster relief.

3. We are not testing water at the tap enough to know whether it contains dangerously high levels of lead. Regulations issued by the Environmental a Protection Agency (EPA) to implement the Safe Drinking Water Act, which is supposed to protect public water sources, are insufficient to detect all lead problems. Under EPA's Lead and Copper Rule, only 100 taps must be tested for lead in a public water system that serves more than one hundred thousand people. The failure to detect dangerously high levels of lead in Flint's water clearly calls into question the adequacy of EPA's requirements for testing at the tap.

4. The EPA is failing to adopt the most current health standard, set by a panel of experts convened by the Centers for Disease Control, for childhood lead exposures. The only good news coming out of the Flint tragedy is that officials there based the declaration of a health emergency on the more protective health standards adopted by the CDC in 2012. EPA still has not adopted that standard. They need to; our children deserve better.

It's easy to put our heads in the sand and pretend that problems don't exist or that we can't afford to fix them. But we owe it to the children of Flint and all American children to face into these problems and allocate the funds needed to fix them.

Strong Link Between Lead & Flint Water (WILX 10)

http://www.wilx.com/home/headlines/Strong-Link-Between-Lead--Flint-Water-363220161.html

Posted: Tue 3:00 AM, Dec 22, 2015

Researchers say they have the strongest evidence yet that links elevated blood-lead levels in children in Flint, Michigan, to the city's water system.
A report by a pediatrician found that city children who have the highest levels of lead in their blood live in areas that have the highest levels of lead in tap water.
And the number of children with high levels of lead in their blood doubled after Flint stopped tapping into Detroit's water system in 2014.

Newly published study gives more evidence of elevated lead in Flint kids (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/health_journal_publishes_blood.html

By Ron Fonger | rfonger1@mlive.com
on December 21, 2015 at 5:44 PM, updated December 22, 2015 at 9:13 AM

FLINT, MI -- The American Journal of Public Health has published research by Dr. Mona Hanna-Attisha that further details the rise in blood lead levels in children who drank Flint River water for as long as 17 months.

Hanna-Attisha, the director of Hurley Medical Center's Pediatric Residency Program, whose initial research first showed rising levels of lead in the blood of Flint children, said the most recent findings support that first study.

"It's a little more detailed. It solidifies the reseach, (and) it's a finer analysis," Hanna-Attisha said today, Dec. 21.

The American Journal of Public Health Research was conducted by Hanna-Attisha; Jenny LaChance of Hurley Research Center; Richard Sadler of the College of Human Medicine Division of Public Health; and Dr. Allison Champney Schnepp, pediatric resident at Hurley Children's Hospital and Michigan State University.

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply.

Even though the city reconnected to the Detroit water system in October, local officials have advised Flint resident not to drink city water unless they are using a lead-clearing filter.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

By spending more time with her initial data, the doctor said the evidence of elevated lead levels in the blood of children younger than 5 became even stronger.

Researchers were able to include only children exposed to Flint River water, removing data for kids who lived in home with Flint zip codes but who actually lived in neighboring cities or township and who were not exposed to river water.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase.

"No significant change was seen outside the city of Flint," the release says. "Most striking, in one area within Flint (blood lead levels) more than tripled ... increasing from 4.9 to 15.7 percent."

Doctor: Strongest link yet between Flint water, kids' lead levels (Midland Daily News)

Was Lead Poisoning From Flint River Preventable? Research Implicates Water Supply (Medical Daily News)

http://www.medicaldaily.com/was-lead-poisoning-flint-river-preventable-research-implicates-water-supply-366452

Dec 22, 2015 01:31 PM By Stephanie Castillo

Just a week after Michigan mayor Karen Weaver declared a state of emergency over elevated levels of lead in children's blood, a new study published in the *American Journal of Public Health* reveals the strongest evidence of a link between elevated blood-lead levels and the city of Flint's poor water system.

Researchers cited in April 2014, the post-industrial city of Flint — the largest city in Michigan's Genesee Country — changed its water supply from the Detroit-supplied Lake Huron water to the Flint River. The change was meant to save the city money and was only temporary; they were awaiting a new pipeline to Lake Huron in 2016. But shortly after the switch, residents voiced concern about the new water's color, taste, odor, and their health. Some were experiencing skin rashes, and water tests detected *Escherichia coli* in the distribution system. Also around this time an unusual number of children had elevated levels of lead in their blood.

Lead is a potent neurotoxin, and in children, elevated blood levels (BLLs) can have developmental and biological effects, researchers said; "most notably intelligence, behavior, and overall life achievement." The Centers for Disease Control and Prevention cited BLLs increased the likelihood of learning disabilities; poorer performance on tests; and being non-proficient in math, science, and reading.

The Huffington Post cited Michigan State officials dismissed more than one report from the Michigan Department of Health and Human Services warning against "higher than usual" lead poisoning rates among children under the age of 16 living in Flint. But is the water change solely to blame?

That's what the present study set out to find. Researchers received BLLs for children younger than 5 years before and after the water source change in Flint in an effort to assess the percentage of elevated BLLs in both time periods. They used medical records to calculate the age they were tested and geocoded the data with a dual-range address locator, though they "derived overall neighborhood-level socioeconomic disadvantage from census block group variables intended to measure material and social deprivation."

The results revealed a "statistically significant increase" in the number of children living in Flint with BLLs from before the water change to the Flint children in the post-period. Before the change, 2.4 percent of children had higher BLLs compared to 4.9 percent of children after the water change.

What's more is in urban areas with high levels of socioeconomic disadvantage and minority populations, there seemed to be a problem with higher BLLs. "A review of alternative sources of lead exposure reveals no other potential environmental confounders during the same time period," researchers said.

Since no alternative source could point to another cofounder, the present findings offer the strongest evidence for the link between Flint's water source change and children's higher BLLs. Dr. Mona Hanna-Attisha, the report's lead writer and an assistant professor at Michigan State University, told AP everybody who drank or cooked with Flint's new water was exposed to lead.

"Lead in drinking water is different from lead from other sources, as it disproportionately affects developmentally vulnerable children and pregnant mothers," Hanna-Attisha and her team explained in their report. "Children can absorb 40 percent to 50 percent of an oral dose of water-soluble lead compared with 3 percent to 10 percent for adults. In a dose–response relationship for children aged 1 to 5 years, for every 1-ppb increase in water lead, blood lead increases 35 percent. The greatest risk of lead in water may be to infants on reconstituted formula."

While AP reported "lead exposure is irreversible and no level is safe," it doesn't affect all children the same. Hanna-Attisha pointed to "good nutrition" as a method of prevention given this better helps "the body excrete toxins instead of absorbing them."

Perhaps better than adhering to a healthy diet is the development of public health programs that educate both children and parents on the signs and side effects of lead poisoning, including but not limited to anemia, low academic achievement, and any unusual behavior changes. In fact, early childhood education was considered a primary method of prevention in the CDC's April 2015 report on children affected by lead.

"Primary prevention strategies that control or eliminate lead sources before children are exposed remain the pre-eminent public health approach to the problem of lead poisoning and are the only effective way to prevent the neurodevelopmental and behavioral abnormalities associated with lead exposure," Dr. Patrick N. Breysse, director of the CDC's National Center for Environmental Health and Agency for Toxic Substance and Disease Registry, prefaced the report's findings.

Since hundreds of thousands of children already have experienced blood lead levels known to impair academic performance and affect life success, in and outside of Flint, Breysse said we need "strategies that restore individuals to an optimal level of functioning after damage is done."

The report concluded everyone from the government, to pediatric health care providers and children's parents need more opportunities to learn the "importance of age appropriate blood lead testing and of primary prevention efforts. They may also need to be informed about the need for vigilance in the period after a test result and at critical transition points in educational expectations such as first, fourth, and sixth grades, and about early intervention programs and the merits of accepting a referral to them."

Toxic Michigan Water Linked to High Lead Levels in Children, Study Finds (TIME)

http://time.com/4159128/flint-michigan-lead-levels-water/

Melissa Chan @melissalchan

Dec. 22, 2015

"Everybody who drank this water or cooked with this water was exposed to lead"

Toxic levels of lead in the water supply in Flint, Mich., have been linked to elevated blood-lead levels in children, a new study has found.

The new findings "strongly implicate the water source change as the probable cause for the dramatic increase," the Flint *Journal* reports, citing the study published in the American Journal of Public Health.

The report found the highest levels of lead in tap water corresponded with where young children with the highest blood-lead levels lived, according to the *Journal*. It also found "no significant change" in blood-lead levels outside of the city.

Dr. Mona Hanna-Attisha, the director of pediatric residency at Hurley Children's Hospital and the study's lead researcher had previously found that the percentage of children with abnormally high blood-lead levels nearly doubled after Flint switched its water source in April 2014 to cheaper water from the Flint River—a discovery that the new study has confirmed. Flint Mayor Karen Weaver declared a state of emergency in mid-December.

"Everybody who drank this water or cooked with this water was exposed to lead," said Dr. Hanna-Attisha.

Michigan Drinking Water Crisis Shows Limits Of EPA Lead Rule Changes (Inside EPA)

http://insideepa.com/inside-epa/michigan-drinking-water-crisis-shows-limits-epa-lead-rule-changes

Posted: December 22, 2015

The drinking water crisis in Flint, MI, is highlighting the potential shortcomings of EPA regulations in preventing lead increases when a water system changes the source of its water, with sources saying that even recommended changes to the lead and copper rule (LCR) may not be enough to prevent a similar situation in the future.

Flint Mayor Karen Weaver declared a state of emergency Dec. 14 for the city due to the elevated levels of lead in drinking water, which have sickened many infants and children, after the city switched its water source from the Detroit water system to the Flint River in 2014. The city has since switched back to Detroit's water.

The declaration comes after several residents filed a class action suit Nov. 13 that charges state and local officials knew that switching drinking water sources would increase lead levels, and after a coalition of environmental and other advocacy groups Nov. 16 issued a notice of intent to sue the same officials, alleging that they failed to properly implement EPA-mandated lead testing and corrosion control programs in Flint.

An EPA task force is working with the state and local officials to address the problem while

Region 5 has launched a "full programmatic review" of Michigan drinking water programs. Region 5 Administrator Susan Hedman said in a Nov. 10 statement that the review will target the Michigan Department of Environmental Quality's (MDEQ) overall implementation of the Safe Drinking Water Act (SDWA) mandates as well as specific standards for total coliform and nitrates, EPA's LCR, and groundwater policies.

EPA's National Drinking Water Advisory Council (NDWAC) is recommending a number of changes to the LCR to further reduce national exposure to lead in drinking water, but the advisors said in November that the Flint crisis primarily was due to a failure to follow current LCR requirements for corrosion control testing. NDWAC included language in an "enhancement" letter to EPA Administrator Gina McCarthy along with the recommendations that says that "prior to the adoption of the new rule, compliance with the existing rule is essential" (*Inside EPA*, Nov. 27).

Under both the current rule and the recommended changes, water systems are not specifically required to conduct any additional testing when they switch water sources, although such testing is advised.

"When a system changes its source or treatment, and is required to consult with the state, the state primacy agency also may choose to require additional one-time monitoring to evaluate those changes if the degree of the change warrants," the draft NDWAC recommendation states. Some drinking water sources are more corrosive than others, increasing the likelihood that lead and copper from water pipes will leach into treated water.

MDEQ did not require the one-time monitoring, and one source with knowledge of the LCR process suggests that was one key mistake in Flint.

"I think everybody's culpable here," the source says. "It makes sense that the state primacy agency should have been involved. . . . The primacy agency does have a role to play, and there should have been some consultation, one would think. If I were creating a water supply, I'd consult with a water agency. They may have, and they may not have."

But the source acknowledges that the intent of the LCR was meant to monitor lead over time. "I don't know that there's an up-front testing requirement" in the rule for a circumstance like Flint, where the water source was switched, the source says. "Part of that gets left to the engineers to say, 'if our water source is going to be x, it's our obligation to do the work up front to figure out [if that will have lead]."

"We know lead is in the plumbing, we know how it gets mobilized, we know a lot about those factors, so in the case of Flint, one has to wonder how much testing was done to determine if there was potential" for contamination, the source says.

Rep. Dan Kildee (D-MI), who represents Flint, suggested at the Nov. 18 NDWAC meeting that EPA should not be left off the hook for the Flint crisis, particularly as it looks to finalize the new LCR.

"Ultimately, EPA has responsibility to ensure clean drinking water standards were followed. This rule must have greater transparency. Residents deserve to know why, for months, Michigan failed to follow federal safe drinking water laws," Kildee told the panel. He added that he hoped EPA Region 5's audit of MDEQ's implementation of SDWA could be included in revisions to the rule.

In the class action suit, *Melissa Mays, et al. v. Rick Snyder, et al.*, the plaintiffs allege that state and local officials deprived citizens of their 14th Amendment rights "in that they deprived plaintiffs of life, liberty and property without due process of law when they took from plaintiffs safe drinking water and replaced it with what they knew to be a highly toxic alternative solely for fiscal purposes." The suit is pending in the U.S. District Court for the Eastern Division of Michigan. *The suit is available on InsideEPA.com. (Doc. ID: 187372)*

The plaintiffs claim officials knew that the water pumped from the Flint River exposed residents to heightened levels of lead, based on a 2013 MDEQ report which warned that the Flint River water was highly corrosive and could not be safely used without an anti-corrosive agent that would prevent lead and copper from leading into the water lines: "Beginning in April 2014, Defendants were fully aware that the required and necessary anti-corrosive was not being used during the distribution of Flint River water to Flint residents, families and homeowners," the plaintiffs write, adding that the daily cost of such an anti-corrosive agent would have been $60.

But in addition to the lack of an anti-corrosive agent, many observers have charged that MDEQ's oversight of Flint was insufficient and that both Flint and MDEQ officials failed to follow EPA rules for monitoring lead levels, including SDWA sampling procedures and the LCR mandate to implement a strategy to reduce corrosion of its drinking water pipes.

A spokesman for EPA Region 5 noted in a recent email to *Inside EPA* that Mayor Weaver had met with Region 5 and MDEQ officials Dec. 11, prior to the state of emergency declaration. -- *Amanda Palleschi*

U.S. Rep. Dan Kildee, D-Flint Township, meets with The Flint Journal Editorial Board on Tuesday, Dec. 22, 2015.Jake May | MLive.com

FLINT, MI -- As questions continue to swirl about who should be held responsible for the Flint water crisis, U.S. Rep. Dan Kildee said the state needs to step forward and fund a program to benefit the health of the city's youngest residents.

Kildee, D-Flint Township, continued to call for a state-financed program during a Tuesday, Dec. 22, meeting with The Flint Journal editorial board that would be used to continually monitor potential health ramifications for those exposed to elevated lead levels in the city's water supply.

News organizations from around the country have brought a renewed spotlight to the city's water issues after newly-elected Mayor Karen Weaver called declared a state of emergency.

However, Kildee said not enough focus has been paid to helping those potentially harmed by the water woes.

"My focus is on getting the kids help," Kildee said, adding that such a health fund would be unprecedented.

Kildee said he has met with members of the medical community, including Dr. Mona Hanna-Attisha, the director of Hurley Medical Center's Pediatric Residency Program, whose initial research first showed rising levels of lead in the blood of Flint children, to try and develop a medical response to what he called a "failure of government."

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply. Even though the city reconnected to the Detroit water system in October, local officials have advised Flint residents not to drink city water unless they are using a lead-clearing filter.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children under 5 years old from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

My focus is on getting the kids help.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase."

The Centers for Disease Control and Prevention says children under 6 are among those at high risk for the effects of lead poisoning. U.S. Census Bureau estimates show there are between 6,000 and 8,000 children under 5 in the city.

Though funded by the state, Kildee said the health fund would be managed locally.

State officials say they have been active in their response to the situation, and pointed to Gov. Rick Snyder's creation of a five-member task force in October charged with reviewing the response to the water crisis and making recommendations.

"We are committed to protecting the health of children in Flint now and into the future, and helping anyone who has been affected by the water challenges in Flint," said Snyder Press Secretary Dave Murray. We're already taking steps called for in Gov. Snyder's action plan, and are working with the Flint Water Task Force to see what additional actions it recommends to help children and adults and address any issues that were created b this situation."

However, some Democratic leaders have claimed the Republican-led state government hasn't done enough to address the situation in Flint.

U.S. Sen. Debbie Stabenow, who was in Flint Tuesday to announce potential new anti-blight funding, called on Lansing to take a larger role in tackling Flint's lead issue.

"The State of Michigan, where the negligence rose, has to step up in a much-bigger way to help Flint," Stabenow said.

Murray said the state is continuing to work with city leaders in addressing the issue and has offered $10 million in grants and other financial assistance to help facilitate the city's switch back to Detroit water, improve the city's water infrastructure and provide filters for residents.

"Flint residents need to have access to safe, clean water," Murray said. "Gov. Snyder and administration members continue to work closely with Mayor Weaver and other city leaders to focus on health issues affecting children and other city residents, and address water infrastructure challenges."

State failed to sound alarm when it knew of rising Flint blood lead levels (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/documents_show_state.html

By Ron Fonger | rfonger1@mlive.com
on December 22, 2015 at 5:55 PM, updated December 23, 2015 at 8:00 AM

FLINT, MI -- State officials found evidence of rising blood lead levels in Flint two months before the problem was exposed by a Flint pediatrician, but didn't immediately inform the public, according to documents released by a water researcher.

Michigan public health officials said today, Dec. 22, that they did not sound an alarm about the spike, which coincided with use of the Flint River for drinking water, because they initially believed the numbers represented a "seasonal fluctuation."

As a result of what happened in Flint, state officials now say that the way the state analyzes the data they collect needs to be "thoroughly reviewed."

Virginia Tech Professor Marc Edwards, a key figure in the Flint water crisis, released 159 pages of public records on his Web site this week, documents received in response to a Freedom of Information Act request to the state.

The records are a collection of emails and attachments, primarily from officials at the Michigan Department of Health & Human Services, about Flint water.

The documents show:

- Emails about blood lead levels in Flint date back to at least July 23 and by July 28, inner-office correspondence says the city's rising numbers warrant further investigation and that "there does appear to be a higher proportion of (elevated blood lead levels) last summer (2014) than usual."
- A report prepared by the state DHHS's Child Health Epidemiology Section, which included data up to July 27, concluded "positive tests for (elevated blood lead levels) were higher than usual for children under age 16 living in the city of Flint during the months of July, August and September 2014."

- A Sept. 11 email from Robert L. Scott of DHHS' Childhood Lead Poisoning Program tells others in the department that he has received a request for information about blood lead levels in Flint. "Sounds like there might be more to this than what we learned previously. Yikes," the email says.

Edwards said today, Dec. 22, that the documents show the state had evidence of elevated blood lead levels in Flint while the Michigan Department of Environmental Quality and the city of Flint denied a public health problem with lead in the city's water supply.

After Edwards reported his testing showed a serious problem with lead in Flint water, a DEQ spokesman questioned the credibility of his research and former Flint mayor Dayne Walling assured residents it was safe to drink until September when a Flint pediatrician reported her findings.

Those denials would not have continued as long as they did had state health officials told the public what it had discovered, the professor said.

"Everything they looked at, they found a problem, and they never told anyone," Edwards said of the agency.

Dr. Eden Wells, chief medical executive for the DHHS, said today that the documents do show missed opportunities for the state to have addressed Flint's lead in water crisis earlier, but do not show an effort to withhold information.

"I have done this a lot after (disease) outbreaks ... You always go back, and learn from them, (including whether evidence) could have allowed for an earlier response," she said.

Wells, who was named by Gov. Rick Snyder to be Flint's drinking water public health adviser, said state health officials initially concluded that spikes in blood lead lead levels immediately after the city changed its water source to the Flint River were seasonal and not related to water.

DHHS officials initially questioned the findings by a Hurley Medical Center pediatrician, Dr. Mona Hanna-Attisha, who on Sept. 24 showed blood lead levels of children in some parts of the city tripled after the switch to Flint River water.

The released emails show that on Sept. 28, in preparation for a news conference on Hanna-Attisha's findings, the director of the state health department said he needed an analysis of the Flint doctor's data and her conclusions.

"I would like to make a strong statement with a demonstration of proof that the lead blood levels seen are not out of the ordinary and are attributable to seasonal fluctuations," the email from DHHS Director Nick Lyon said.

Blood lead levels above 5 micrograms per deciliter are considered elevated by the Center for Disease Control and Prevention.

Wells said only after reviewing the state's own data further, examining it based on zip codes and focusing on young children, who are most susceptible to lead poisoning, could she conclude blood lead levels were rising among Flint children under 5 years old.

Jennifer Eisner, a spokeswoman for DHHS, said the department initially believed higher blood lead levels were due to seasonal fluctuations.

"As a result of this process, we have determined that the way we analyze data collected needs to be thoroughly reviewed," Eisner said in an email to The Flint Journal-MLive.

Wells was involved in a follow-up examination of state data after Hanna-Attisha made her research public in late September. Wells eventually agreed with the Flint doctor.

Edwards said he spent weeks in an effort to get access to state blood lead level data after testing of Flint water by Virginia Tech found lead levels in water rising as well.

The professor said he encountered resistance from state agencies in releasing blood lead data, delaying efforts to address the problem.

Edwards' experiments on the river water found it was far more corrosive than Lake Huron water that had been purchased from the Detroit water system and used in Flint for decades.

Flint reconnected to the Detroit system in October, using state, local and grant funds to end its use of the Flint River after 17 months.

State and federal reviews of how the Flint's water crisis was allowed to happen are ongoing.

New study links tainted water, high lead levels in kids in Flint, Mich. (CBS)

http://www.cbsnews.com/news/tainted-water-high-lead-levels-kids-flint-michigan/

A new study provides the strongest evidence yet of a link between elevated blood-lead levels in children living in Flint, Michigan, and the struggling city's water system, a pediatrician who first raised alarms about the matter said Monday.

Dr. Mona Hanna-Attisha, director of pediatric residency at Hurley Children's Hospital, and other experts compiled the report using a more refined analysis. It showed that areas in Flint with the highest levels of lead in tap water corresponded with where young children with the highest blood-lead levels lived.

The study also confirmed her earlier assessment that the percentage of children with abnormally high blood-lead levels had at least doubled after the city stopped tapping Detroit's water system to save money in 2014, and began using water from the nearby Flint River.

The findings "strongly implicate the water source change as the probable cause for the dramatic increase," according to the report published in the American Journal of Public Health. The report said the results probably understate the danger because testing is not conducted before birth and during infancy, when numbers likely would be higher. Screenings usually are performed between ages 1 and 2.

"Everybody who drank this water or cooked with this water was exposed to lead," said Hanna-Attisha, the report's lead writer and an assistant professor at Michigan State University.

Flint and Genesee County have declared public health emergencies amid public outrage over the tainted water. Lead is a powerful toxin that can damage human nervous systems and is particularly harmful for young children, causing lower intelligence, developmental delays and behavior problems.

"Lead at any level can be associated with decreases in IQ, behavioral disorders, even an association with certain juvenile delinquency as these children get older," Dr. Eden Wells, Chief Medical Executive for the Michigan Department of Health and Human Services, told CBS News.

The city of about 99,000 residents started using the Flint River as an interim water source until it could hook up to a new system drawing water from Lake Huron that is scheduled for completion next year. The cost-cutting move was made while the city was under state emergency financial management.

But the river water drew complaints about its taste, smell and appearance.

Hanna-Attisha announced in September that data from blood tests routinely administered to young children showed that lead levels had jumped since the water systems were changed. State officials initially challenged, but later acknowledged, the findings, and Flint resumed using Detroit water. The state has approved millions of dollars in aid to address the crisis.

For their updated study, Hanna-Attisha and her colleagues refined their data, focusing specifically on children under age 5 within the city limits and excluding those who live outside the city but within Flint ZIP codes, where no significant changes in blood-lead levels were found.

The researchers found that the proportion of children with at least five milligrams of lead per deciliter - the point considered elevated - had risen from 2.4 percent in the nine months before the water switch to 4.9 percent in the nine months afterward.

In neighborhoods with the highest water lead levels, the increase was even bigger: to 6.6 percent. And in one section of town, the percentage of children with elevated levels went from 4.9 percent to 15.7 percent.

No reason for the higher blood-lead levels except the water was found, the study said.

Health problems from lead can be hard to spot in young children, said Dr. Marcie Billings of the Mayo Clinic Children's Center in Rochester, Minnesota, who did not participate in the study. But parents should watch for future red flags such as anemia, low academic achievement and unusual behavioral changes, she said.

Although lead exposure is irreversible and no level is safe, not every affected child will suffer the worst results, Hanna-Attisha said. Good nutrition can help the body excrete toxins instead of absorbing them. Effective early-childhood education and relief from stresses such as poverty and violence are important.

"We have an opportunity to build a model public health program so we don't see these consequences," she said.

Concerned families can visit their pediatrician's office or go to their local health department for free blood level testing. Medicaid pays for lead tests.

"We really worry about pregnant women and infants. We know that long-standing lead exposure can lead to some long-term effects," said Dr. Carlos Lerner, medical director of the Children's Health Center at the Mattel Children's Hospital UCLA,

4 lessons we must learn from the tragedy in Flint

The water supply in Flint, Mich., contains toxic levels of lead that are particularly harmful to children. The costs needed to begin to fix this led Flint Mayor Karen Weaver to declare a state of emergency in mid-December.

This is a tragedy—one that was entirely avoidable. The poisoning is the result of short-sighted changes by the government that were focused on saving money and that were made without adequate consideration of potential consequences. If we don't start addressing the underlying problems, there will likely be more Flints to come.

What happened in Flint?

Flint management decided to switch the city's water source from water supplied by Detroit to a new source from Lake Huron. But because the pipelines needed were a year and a half away from being completed, Flint residents were switched temporarily in April 2014 to cheaper water from the Flint River.

Changing drinking water sources isn't as simple as changing a budget number and flipping a switch. The pipes that deliver water within Flint—like the pipes in many cities throughout the U.S.—are old and made of or contain lead. The chemical makeup of the water from the Flint River makes it more corrosive than Detroit's water, causing lead to leach from the aging pipes, contaminating Flint's water with dangerous levels of lead.

A study presented in September by the Hurley Medical Center showed that blood lead levels in children under 5 years of age living in Flint zip codes that were supplied by the Flint River water increased dramatically in the year and a half that Flint's water was sourced from the Flint River. Further, the number of Flint children in those zip codes with dangerously elevated blood levels more than doubled in just that year and a half.

Lead is toxic, especially for children. Children exposed to lead face significantly increased risks of impaired brain development and cognitive functions, lower IQs, attention-related behavior problems, lower levels of academic achievement, and violent tendencies. Flint's children now face these risks.

We can't undo what happened in Flint. But we can learn from it and protect potentially millions of children throughout the U.S. Here are four lessons from Flint.

1. The drinking water infrastructure in the U.S. is aging to the point of danger. In Chicago, where I live, for example, some of the pipes that deliver drinking water to homes are 100 years old. We drink water from Lake Michigan that is treated for safety from chemicals and disease, but between the water treatment plant and our taps, that water runs through old pipes that can leach lead. Chicago is now replacing 900 miles of water mains in a process that will take 10 years. Today, we know better than to use lead pipes to transport water. But millions of people in the U.S. are still getting water from old lead pipes. Until those pipes are replaced, the lead hazard will remain.

2. Short-term budget "fixes" often cost more in the long-run. After the lead issue was discovered, Flint was hooked back up to Detroit's water supply for the short time left until the new Lake Huron pipelines are available. The cost to switch back is reported to be $12 million. In addition, there will be the costs of testing, monitoring and treating Flint's children. These costs are what led Flint's mayor to seek federal disaster relief.

3. We are not testing water at the tap enough to know whether it contains dangerously high levels of lead. Regulations issued by the Environmental a Protection Agency (EPA) to implement the Safe Drinking Water Act, which is supposed to protect public water sources, are insufficient to detect all lead problems. Under EPA's Lead and Copper Rule, only 100 taps must be tested for lead in a public water system that serves more than one hundred thousand people. The failure to detect dangerously high levels of lead in Flint's water clearly calls into question the adequacy of EPA's requirements for testing at the tap.

4. The EPA is failing to adopt the most current health standard, set by a panel of experts convened by the Centers for Disease Control, for childhood lead exposures. The only good news coming out of the Flint tragedy is that officials there based the declaration of a health emergency on the more protective health standards adopted by the CDC in 2012. EPA still has not adopted that standard. They need to; our children deserve better.

It's easy to put our heads in the sand and pretend that problems don't exist or that we can't afford to fix them. But we owe it to the children of Flint and all American children to face into these problems and allocate the funds needed to fix them.

Strong Link Between Lead & Flint Water (WILX 10)

http://www.wilx.com/home/headlines/Strong-Link-Between-Lead--Flint-Water-363220161.html

Posted: Tue 3:00 AM, Dec 22, 2015

By: AP

Researchers say they have the strongest evidence yet that links elevated blood-lead levels in children in Flint, Michigan, to the city's water system.
A report by a pediatrician found that city children who have the highest levels of lead in their blood live in areas that have the highest levels of lead in tap water.
And the number of children with high levels of lead in their blood doubled after Flint stopped tapping into Detroit's water system in 2014.

Newly published study gives more evidence of elevated lead in Flint kids (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/health_journal_publishes_blood.html

By Ron Fonger | rfonger1@mlive.com
on December 21, 2015 at 5:44 PM, updated December 22, 2015 at 9:13 AM

FLINT, MI -- The American Journal of Public Health has published research by Dr. Mona Hanna-Attisha that further details the rise in blood lead levels in children who drank Flint River water for as long as 17 months.

Hanna-Attisha, the director of Hurley Medical Center's Pediatric Residency Program, whose initial research first showed rising levels of lead in the blood of Flint children, said the most recent findings support that first study.

"It's a little more detailed. It solidifies the reseach, (and) it's a finer analysis," Hanna-Attisha said today, Dec. 21.

The American Journal of Public Health Research was conducted by Hanna-Attisha; Jenny LaChance of Hurley Research Center; Richard Sadler of the College of Human Medicine Division of Public Health; and Dr. Allison Champney Schnepp, pediatric resident at Hurley Children's Hospital and Michigan State University.

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply.

Even though the city reconnected to the Detroit water system in October, local officials have advised Flint resident not to drink city water unless they are using a lead-clearing filter.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

By spending more time with her initial data, the doctor said the evidence of elevated lead levels in the blood of children younger than 5 became even stronger.

Researchers were able to include only children exposed to Flint River water, removing data for kids who lived in home with Flint zip codes but who actually lived in neighboring cities or township and who were not exposed to river water.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase.

"No significant change was seen outside the city of Flint," the release says. "Most striking, in one area within Flint (blood lead levels) more than tripled ... increasing from 4.9 to 15.7 percent."

Doctor: Strongest link yet between Flint water, kids' lead levels (Midland Daily News)

http://www.ourmidland.com/news/doctor-strongest-link-yet-between-flint-water-kids-lead-levels/article_3d0658bc-a85e-11e5-9a57-0789c0b1bc41.html

Associated Press

Updated Dec 21, 2015

A new study provides the strongest evidence yet of a link between elevated blood-lead levels in children living in Flint, Michigan, and the struggling city's water system, a pediatrician who first raised alarms about the matter said Monday.

Dr. Mona Hanna-Attisha, director of pediatric residency at Hurley Children's Hospital, and other experts compiled the report using a more refined analysis. It showed that areas in Flint with the highest levels of lead in tap water corresponded with where young children with the highest blood-lead levels lived.

The study also confirmed her earlier assessment that the percentage of children with abnormally high blood-lead levels had at least doubled after the city stopped tapping Detroit's water system to save money in 2014, and began using water from the nearby Flint River.

The findings "strongly implicate the water source change as the probable cause for the dramatic increase," according to the report published in the American Journal of Public Health. The report said the results probably understate the danger because testing is not conducted before birth and during infancy, when numbers likely would be higher. Screenings usually are performed between ages 1 and 2.

"Everybody who drank this water or cooked with this water was exposed to lead," said Hanna-Attisha, the report's lead writer and an assistant professor at Michigan State University.

Flint and Genesee County have declared public health emergencies amid public outrage over the tainted water. Lead is a powerful toxin that can damage human nervous systems and is particularly harmful for young children, causing lower intelligence, developmental delays and behavior problems.

The city of about 99,000 residents started using the Flint River as an interim water source until it could hook up to a new system drawing water from Lake Huron that is scheduled for completion next year. The cost-cutting move was made while the city was under state emergency financial management.

But the river water drew complaints about its taste, smell and appearance.

Hanna-Attisha announced in September that data from blood tests routinely administered to young children showed that lead levels had jumped since the water systems were changed. State officials initially challenged, but later acknowledged, the findings, and Flint resumed using Detroit water. The state has approved millions of dollars in aid to address the crisis.

For their updated study, Hanna-Attisha and her colleagues refined their data, focusing specifically on children under age 5 within the city limits and excluding those who live outside the city but within Flint ZIP codes, where no significant changes in blood-lead levels were found.

The researchers found that the proportion of children with at least five milligrams of lead per deciliter — the point considered elevated — had risen from 2.4 percent in the nine months before the water switch to 4.9 percent in the nine months afterward.

In neighborhoods with the highest water lead levels, the increase was even bigger: to 6.6 percent. And in one section of town, the percentage of children with elevated levels went from 4.9 percent to 15.7 percent.

No reason for the higher blood-lead levels except the water was found, the study said.

Health problems from lead can be hard to spot in young children, said Dr. Marcie Billings of the

Mayo Clinic Children's Center in Rochester, Minnesota, who did not participate in the study. But parents should watch for future red flags such as anemia, low academic achievement and unusual behavioral changes, she said.

Although lead exposure is irreversible and no level is safe, not every affected child will suffer the worst results, Hanna-Attisha said. Good nutrition can help the body excrete toxins instead of absorbing them. Effective early-childhood education and relief from stresses such as poverty and violence are important.

"We have an opportunity to build a model public health program so we don't see these consequences," she said.

Was Lead Poisoning From Flint River Preventable? Research Implicates Water Supply (Medical Daily News)

http://www.medicaldaily.com/was-lead-poisoning-flint-river-preventable-research-implicates-water-supply-366452

Dec 22, 2015 01:31 PM By Stephanie Castillo

Just a week after Michigan mayor Karen Weaver declared a state of emergency over elevated levels of lead in children's blood, a new study published in the *American Journal of Public Health* reveals the strongest evidence of a link between elevated blood-lead levels and the city of Flint's poor water system.

Researchers cited in April 2014, the post-industrial city of Flint — the largest city in Michigan's Genesee Country — changed its water supply from the Detroit-supplied Lake Huron water to the Flint River. The change was meant to save the city money and was only temporary; they were awaiting a new pipeline to Lake Huron in 2016. But shortly after the switch, residents voiced concern about the new water's color, taste, odor, and their health. Some were experiencing skin rashes, and water tests detected *Escherichia coli* in the distribution system. Also around this time an unusual number of children had elevated levels of lead in their blood.

Lead is a potent neurotoxin, and in children, elevated blood levels (BLLs) can have developmental and biological effects, researchers said; "most notably intelligence, behavior, and overall life achievement." The Centers for Disease Control and Prevention cited BLLs increased the likelihood of learning disabilities; poorer performance on tests; and being non-proficient in math, science, and reading.

The Huffington Post cited Michigan State officials dismissed more than one report from the Michigan Department of Health and Human Services warning against "higher than usual" lead poisoning rates among children under the age of 16 living in Flint. But is the water change solely to blame?

That's what the present study set out to find. Researchers received BLLs for children younger than 5 years before and after the water source change in Flint in an effort to assess the percentage of elevated BLLs in both time periods. They used medical records to calculate the age they were tested and geocoded the data with a dual-range address locator, though they "derived overall neighborhood-level socioeconomic disadvantage from census block group variables intended to measure material and social deprivation."

The results revealed a "statistically significant increase" in the number of children living in Flint with BLLs from before the water change to the Flint children in the post-period. Before the change, 2.4 percent of children had higher BLLs compared to 4.9 percent of children after the water change.

What's more is in urban areas with high levels of socioeconomic disadvantage and minority populations, there seemed to be a problem with higher BLLs. "A review of alternative sources of lead exposure reveals no other potential environmental confounders during the same time period," researchers said.

Since no alternative source could point to another cofounder, the present findings offer the strongest evidence for the link between Flint's water source change and children's higher BLLs. Dr. Mona Hanna-Attisha, the report's lead writer and an assistant professor at Michigan State University, told AP everybody who drank or cooked with Flint's new water was exposed to lead.

"Lead in drinking water is different from lead from other sources, as it disproportionately affects developmentally vulnerable children and pregnant mothers," Hanna-Attisha and her team explained in their report. "Children can absorb 40 percent to 50 percent of an oral dose of water-soluble lead compared with 3 percent to 10 percent for adults. In a dose–response relationship for children aged 1 to 5 years, for every 1-ppb increase in water lead, blood lead increases 35 percent. The greatest risk of lead in water may be to infants on reconstituted formula."

While AP reported "lead exposure is irreversible and no level is safe," it doesn't affect all children the same. Hanna-Attisha pointed to "good nutrition" as a method of prevention given this better helps "the body excrete toxins instead of absorbing them."

Perhaps better than adhering to a healthy diet is the development of public health programs that educate both children and parents on the signs and side effects of lead poisoning, including but not limited to anemia, low academic achievement, and any unusual behavior changes. In fact, early childhood education was considered a primary method of prevention in the CDC's April 2015 report on children affected by lead.

"Primary prevention strategies that control or eliminate lead sources before children are exposed remain the pre-eminent public health approach to the problem of lead poisoning and are the only effective way to prevent the neurodevelopmental and behavioral abnormalities associated with lead exposure," Dr. Patrick N. Breysse, director of the CDC's National Center for Environmental Health and Agency for Toxic Substance and Disease Registry, prefaced the report's findings.

Since hundreds of thousands of children already have experienced blood lead levels known to impair academic performance and affect life success, in and outside of Flint, Breysse said we need "strategies that restore individuals to an optimal level of functioning after damage is done."

The report concluded everyone from the government, to pediatric health care providers and children's parents need more opportunities to learn the "importance of age appropriate blood lead testing and of primary prevention efforts. They may also need to be informed about the need for vigilance in the period after a test result and at critical transition points in educational expectations such as first, fourth, and sixth grades, and about early intervention programs and the merits of accepting a referral to them."

Toxic Michigan Water Linked to High Lead Levels in Children, Study Finds (TIME)

http://time.com/4159128/flint-michigan-lead-levels-water/

Melissa Chan @melissalchan

Dec. 22, 2015

"Everybody who drank this water or cooked with this water was exposed to lead"

Toxic levels of lead in the water supply in Flint, Mich., have been linked to elevated blood-lead levels in children, a new study has found.

The new findings "strongly implicate the water source change as the probable cause for the dramatic increase," the Flint *Journal* reports, citing the study published in the American Journal of Public Health.

The report found the highest levels of lead in tap water corresponded with where young children with the highest blood-lead levels lived, according to the *Journal*. It also found "no significant change" in blood-lead levels outside of the city.

Dr. Mona Hanna-Attisha, the director of pediatric residency at Hurley Children's Hospital and the study's lead researcher had previously found that the percentage of children with abnormally high blood-lead levels nearly doubled after Flint switched its water source in April 2014 to cheaper water from the Flint River—a discovery that the new study has confirmed. Flint Mayor Karen Weaver declared a state of emergency in mid-December.

"Everybody who drank this water or cooked with this water was exposed to lead," said Dr. Hanna-Attisha.

Here's a quick draft ... we can get this posted first thing tomorrow morning once it's approved:

October 23-24, 2015 – Task Force provides MDEQ with technical comments on Flint Corrosion Control Plan.

October 30, 2015 – Task Force provides MDEQ with technical comments on Flint Corrosion Control Permit and cover letter. Key comment was on the amount of additiona

November 10, 2015 – Task Force meets in Flint with Rep. Kildee and City of Flint officials to discuss technical issues with optimization of corrosion control.

November 23, 2015 - Task Force provides comments on Flint's "Residential Drinking Water Lead & Copper Sampling Instructions".

November 25, 2015 – Task Force provides MDEQ with a Draft "Preliminary Assessment of Optimization and Maintenance of Optimal Corrosion Control Treatment" which documents the activities necessary to enable EPA to provide advice and support to Flint in optimizing and maintaining corrosion control treatment under current water quality conditions and during the transition to the Karegnondi Water Authority (KWA) pipeline.

December 4, 2015 - Task Force provides comments on Michigan Department of Health and Human Services' "Draft Protocol for Collecting Residential Drinking Water Samples for Lead Analysis".

December 16, 2015 - Task Force provides recommendations that Flint develop and implement a Performance Assessment Plan prior to distribution of water from the Karegnondi Water Authority (KWA) source.

According to the EPA website, the Flint Safe Drinking Water Task Force hasn't done anything since November 10th – the day we met with Rep. Kildee in Flint. I suggest that we update the website asap, using the information about Task Force activities set forth in the two attachments. Also, we need to designate someone to be in charge of keeping the Task Force web page up to date. Thanks very much.

Paul Egan, Detroit Free Press 10:09 a.m. EST December 24, 2015

LANSING — Lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the Michigan Department of Environmental Quality to wrongly indicate the water was safe to drink, e-mails show.

The records — obtained by the Michigan ACLU and by Marc Edwards, a Virginia Tech researcher who helped raise concerns about Flint's water — show how state officials first appear to have encouraged the City of Flint to find water samples with low lead levels and later told Flint officials to disqualify two samples with high readings. The move changed the overall lead level results to acceptable from unacceptable.

The e-mails also show that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency on Feb. 27 that Flint had "an optimized corrosion control program" to prevent lead from leaching into the drinking water from pipes, connections and fixtures. In fact, the city — disastrously — had no corrosion control program.

Why those DEQ officials took the actions they did is a question at the center of a tragedy that has left an unknown number of children and other Flint residents poisoned by lead, and has led to a federal lawsuit and calls for a U.S. Justice Department investigation. The questions surrounding the testing are in addition to the broader question of why Flint, which was under the control of a state-appointed emergency manager at the time, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

Brad Wurfel, a spokesman for DEQ Director Dan Wyant, declined to say Tuesday why Busch gave inaccurate information to the EPA, why another DEQ official told Flint officials he was hoping they would send him water samples showing low lead levels, or why the DEQ was strict in disqualifying certain water samples with high lead readings but not strict in disqualifying other samples showing low lead levels that did not appear to meet the sampling criteria.

"Most of these questions regard issues presently before the governor's independent after-action review panel," Wurfel told the Free Press in an e-mail. "We don't want to get in front of that review."

On June 25, Adam Rosenthal, of the DEQ's Office of Drinking Water and Municipal Assistance, sent an e-mail about the water samples, required under the federal Lead and Copper Rule, to Michael Glasgow, a utilities administrator with the City of Flint.

The Michigan Department of Environmental Quality revised downward the results of water samples in Flint. (Photo: Detroit Free Press file photo)

"Just wanted to remind you/confirm that Flint is on track for a few items," Rosenthal wrote in the e-mail, which he copied to two other DEQ officials.

"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they are will be (sic) below the AL (action level) for lead," the e-mail said. "As of now with 39 results, Flint's 90th percentile is over the AL for lead."

If 100 lead-in-water samples were listed in ascending order, the 90th percentile would be the 90th sample, meaning 10 samples would have higher readings. To stay below the "action level," which triggers requirements for public notification and steps to reduce the amount of lead in the water, the 90th percentile for Flint's drinking water samples had to be at or below 15 parts per billion. To put it another way, Flint's water would reach an action level if more than 10% of the samples exceed 15 parts per billion.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said there is only one way to read the Rosenthal e-mail.

"The MDEQ informed the City of Flint that they were in danger of going in violation, and they asked for low samples," Mays told the Free Press.

Wurfel wouldn't comment when asked if that's how the e-mail should be interpreted. Rosenthal did not respond to an e-mail seeking comment. Busch, who was copied on the e-mail Rosenthal sent to Flint, sent an automated e-mail reply that said he is out of the office until Jan. 4.

Had Flint's water sampling come in above the action level, it would have triggered action in July. Instead, it was not until October, after blood test results showed elevated lead levels in Flint children, that the DEQ admitted making a mistake about failing to require the addition of needed corrosion control chemicals to the Flint River water. The state also provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

The EPA requires that water sampling be done at "high-risk" locations whenever possible. To comply with that, the American Water Works Association says cities such as Flint should collect 50% of samples from homes with lead service lines. For the samples taken in 2015, the EPA rules also required that Flint sample the same 100 homes it sampled the previous year, between July and December of 2014.

But the City of Flint didn't get 100 samples in 2015. After receiving Rosenthal's e-mail expressing a hope for samples below the action level, the city in the next five days collected 30 additional samples, all of which were below the action level.

The DEQ decided that fewer than 100 samples would suffice because Flint's population had dropped below 100,000.

But Edwards said the smaller number of samples the DEQ allowed still should have come from the group of 100 homes tested a year earlier and should have all come from homes at high risk for lead.

The Michigan ACLU, and later the Flint Journal has reported that seven of the additional samples the city collected, or nearly 25% of them, came from a single stretch of Flushing Road in Flint, where the city had replaced a lengthy session of water main in 2007. Not surprisingly, all of those samples measured very low for lead.

In all, the newspaper reported, only 13 of the homes sampled were from the same list of 100 homes tested in 2014. All the homes that were sampled for a second time in 2015 had tested low for lead in 2014. None of the homes that in 2014 had lead levels above the 15 parts per billion action level were sampled a second time.

Edwards told the Free Press the samples were "cherry-picked," and that's a violation of federal law.

Wurfel would not comment when asked if that was the case.

Even then, the 71 samples Flint relied on would have put the city's water above the action level under the original report Flint prepared, dated July 28. Only after two high lead samples were disqualified at the direction of the DEQ, bringing the total number of samples used down to 69, was the water found to be at 11 parts per billion for lead, below the action level.

The revised report, dated Aug. 20, included the following comment from Flint utilities administrator Michael Glasgow: "Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria ..."

One of the disqualified samples, which showed lead at more than 100 parts per billion, came from the home of LeeAnne Walters. Walters had subsequently been retested with results coming back even worse and was visited by an EPA official in April. That EPA official, Miguel Del Toral, found that Walters' indoor plumbing was plastic and could not be the source of the high lead readings, as the DEQ had suggested to him.

The DEQ disqualified another high lead-level sample because it did not come from a single-family residence.

On Aug. 4, Walters, other community activists, and concerned pastors met at the Capitol with top aides to the governor and officials from the DEQ. Walters asked why her sample wasn't used and didn't get an explanation. She and others at the meeting say Harvey Hollins, an aide to Gov. Rick Snyder who was last week named the state's point man on the Flint water issue, instructed DEQ officials to get back to her on why her sample wasn't used.

Walters says she never received that explanation, but the DEQ produced a letter sent to Walters by e-mail in response to a FOIA request from Edwards.

In the Aug. 25 e-mail, Liane Shekter Smith, who at the time was the chief of the DEQ's Office of Drinking Water and Municipal Assistance but was reassigned in October after the DEQ acknowledged oversight mistakes in connection with Flint's drinking water, tells Walters her results were disqualified because she uses a water filter.

Walters said that she had been instructed to remove the filter before taking any water samples and always did so.

Though it was strict in disqualifying the high samples from Walters, the DEQ did not strictly enforce other requirements related to the samples, such as that they all come from the same group of homes sampled a year earlier, or that they come from homes at high risk for lead.

"The state is the one monitoring these decisions," Walters said. "They should be doing their job accurately. Someone should be holding them accountable for not doing things the way they were supposed to."

Questions over emergency manager law arise in Flint water rates lawsuit (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/questions_arise_regarding_publ.html

By Amanda Emery | aemery@mlive.com

on December 23, 2015 at 10:47 AM, updated December 23, 2015 at 8:51 PM

FLINT, MI — A Genesee County judge has ruled the city can continue shutting off water to Flint customers who haven't paid their bills since September.

Circuit Court Judge Archie Hayman on Tuesday, Dec. 22, said the city of Flint is mostly complying with some portions of his injunction in a lawsuit over Flint's past water rate increases but needs to complete others.

In September, the city started sending water bills reflecting the lower rates ordered by Hayman. In December, the city started sending shut-off notices to residents who hadn't paid the new lower bills.

Attorney Val Washington, who is representing Flint residents in the class-action lawsuit, which claims the city illegally raised rates, has questioned whether the city is complying with Hayman's August injunction.

Hayman ruled Tuesday there could be no shut-offs for past-due delinquencies, with the exception of those who haven't paid their bills since September.

Hayman also said, although the city has adjusted rates from Sept. 16, 2011, to July 1, 2012, those adjustments applied only to the water commodity and not the service charges for that period.

"The courts' intent was to have that 35 percent applied for both," Hayman said.

Hayman also ordered the city and Washington to meet to negotiate on how to pay back $15.7 million that was "wrongfully taken" from water and sewer funds. He said the City Council should meet to discuss the transfer of the funds.

"As it stands right now, I want my injunction complied with," Hayman said in court.

The water rate saga will continue in court over questions on whether the water rates set by an emergency manager are valid after an earlier version of Michigan's emergency manager law was repealed.

"It raises the issue about Public Act 4," Washington said. "Any actions taken ... they went away when the law went away."

Washington argues that the actions under the law are not valid, so a rate set July 1, 2012, wouldn't survive the repeal of the act.

City Administrator Natasha Henderson said the city is pleased with the decision.

"The city is pleased that Judge Hayman reconsidered the determination made in his preliminary injunction and looks forward to the financial stability his revised ruling will provide the city," Henderson said in a statement. "The city appreciates the work of City Attorney Anthony Chubb and his team."

Flint City Councilman Eric Mays said he looks forward to a special meeting or executive session to discuss the transfer of the water funds.

The judge also ordered the city to set up a separate account for water funds so it can be seen what the funds are used for. Hayman said the funds could not be used to pay general obligations of the city and are to be used for operations, maintenance and administration.

The next court date to discuss the impact of the repeal of the emergency manager law and how that will affect the improper rate increase might be in the coming month, Washington said.

Flint judge sides with city over water shutoffs (WLNS 6)

http://wlns.com/2015/12/23/flint-judge-sides-with-city-over-water-shutoffs/

WLNS Web Staff Published: December 23, 2015, 9:32 pm

FLINT, MI (WLNS) – A Flint judge has sided with the city in a legal battle over disconnecting water for those who haven't paid their bills.

Back in August Genesee County circuit court judge ordered flint to cease water shut-offs until it rolled back a 2011 rate hike.

The city sent out bills reflecting the court-ordered lower rate in back in September and also gave shut-off notices for those who didn't pay their new, lower bills.

But now some legal experts say the city has not compiled with a judge's original orders.

This ruling comes as the city continues to re-solve a water crisis after it was discovered there was un-safe amounts of lead in the drinking water.

Congressman calls for state water crisis health fund on Rachel Maddow show (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/congressman_continues_call_for.html

By Gary Ridley | gridley@mlive.com

on December 24, 2015 at 9:33 AM, updated December 24, 2015 at 9:40 AM

FLINT, MI – U.S. Rep. Dan Kildee took to the Rachel Maddow show to continue his call for the state to create a health fund to help Flint's youngest residents potentially affected by the city's water crisis.

Kildee, D-Flint Township, appeared on the MSNBC pundit's program Wednesday, Dec. 23, and called on Gov. Rick Snyder to provide funding for a program that would provide continued health assistance for Flint children who have been diagnosed with elevated blood lead levels.

"We need more than an apology and an acknowledgement that they failed," Kildee said of state leaders. "We need them to make it right."

It was the fourth time in the past two weeks that Flint's water crisis has been prominently featured on the Rachel Maddow show.

Kildee said he hasn't yet put a price tag on the health fund program, but he said it should provide health, nutritional and educational support for children under 5 years old. He said he has plans to continue meeting with health officials to develop the specifics of the fund.

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

We need more than an apology and an acknowledgement that they failed.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply. Even though the city reconnected to the Detroit water system in October, local officials have advised Flint residents not to drink city water unless they are using lead-clearing filters.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children younger than 5 from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase."

The Centers for Disease Control and Prevention said children younger than 6 are among those at high risk for the effects of lead poisoning. U.S. Census Bureau estimates show there are 6,000 to 8,000 children younger than 5 in the city.

Snyder's office said they are continuing to work with local leaders to provide a solution to the city's water problem.

"Gov. Snyder is committed to working with Mayor Weaver and city leaders to do what is necessary to protect the health of Flint residents," said Snyder's Press Secretary Dave Murray. "We're working to build upon the work that is already in progress as part of the Governor's action plan and the $10 million provided for the reconnection to Detroit water, filters for residents and efforts to improve the city's water infrastructure."

- Maddow, reported Tuesday, Dec. 22, on documents released this week by Virginia Tech university professor Marc Edwards, which show state health officials didn't immediately inform the public after finding evidence of rising blood lead levels in Flint two months before the problem was exposed by a Flint pediatrician.
- On Friday, Dec. 18, Maddow interviewed Hanna-Attisha, director of Hurley Medical Center's Pediatric Residency Program and the doctor whose study on rising blood lead levels in Flint children helped force the city and state to stop use of the Flint River for drinking water.
- On Dec. 15, Flint Mayor Karen Weaver appeared on the Maddow show to discuss her push to have Flint declared a federal disaster area because of damage river water has caused to Flint children and to the city's infrastructure.

Maddow's entire interview can be viewed here.

Suffer, Flint's Children (Dissident Voice)

http://dissidentvoice.org/2015/12/suffer-flints-children/

by James Hoover / December 24th, 2015

It is quite shocking that no one from the Rick Snyder administration in Michigan is on trial, impeached or in jail for charges such as felony child endangerment. Such charges involve a person engaged in conduct that places a child in imminent danger of death, bodily injury, or physical or mental impairment. It is a charge that can involve an act or even an omission.

The determination usually looks at two different aggravating factors, the first being intent. Was the conduct merely negligent or reckless, or willful or intentional? The former is a misdemeanor, the latter, a felony. The second factor is the degree of risk: the higher the risk, the higher the charge.

Such should be the consideration in the lead poisoning of children by corrosive Flint River water in Flint, Michigan. The switch to Flint River water was perpetrated by an emergency manager in Flint, who changed Flint's water source to the Flint River without treating the river water, something experience teaches us is almost always necessary. He was appointed by and reported to Michigan Governor Rick Snyder. Conditions of risk were perpetuated over some 13 months after symptoms and subsequent blood tests showed high levels of lead poisoning in Flint children.

Such deleterious results too often come with a tyranny that suspension of democracy can bring. In a number of Michigan cities, emergency managers appointed under the authority of Michigan's so-called Emergency Manager Law, replace elected representatives, making changes impacting the health and welfare of citizens. In effect, citizens of affected cities and school districts become chattels of one would-be autocrat, appointed by Governor Rick Snyder.

A temporary solution has become permanent in such principalities in an area suffering under a shift in political power that brought labor's decline and management's ascent as money took hold of government.

An area nicknamed the Rust Belt, formerly known as the industrial heartland of America, is a belt that stretches along the Southern boundaries of the Great Lakes, also covering the Midwest States, New York areas and eastern Wisconsin. It is marked by economic decline, fleeing populations, and urban decay due to numerous economic factors, including automation, globalization, the *Wall Street* recession, and technological change. But many of the factors were politically imposed by the exigencies of shifting power from middle class citizens to Wall Street and crony capitalists.

In 2008, such a shift was evident when the financial abuse of Wall Street bankers resulted in the threatened bankruptcies of giant banks. The reaction of the federal government was multi-billion dollar bailouts, this while stricken consumers were forgotten, as well as citizens of already bankrupt cities throughout the so-called Rust Belt who went even deeper into economic ruin. Such troubled citizens were met with even further cuts, a result of GOP-driven austerity measures, most involving cuts to federal support for local economic services.

The unequal treatment played out with bailouts of monolithic banks and the smack-down of citizens of cities and schools considered wasteful and reckless.

Emergency management laws have been Michigan's answer to financial decline in many cities throughout the state. Currently, Hamtramck, Detroit, Flint, Pontiac, Benton Harbor, Allen Park and the school districts of Muskegon Heights, Highland Park and Detroit are under the control of an emergency manager.

You might argue that the elected leaders of such bankrupt Michigan cities must be replaced with responsible leaders, but such leadership seems to be an excuse for imposing the conservative ideology of governors such as Snyder and a GOP legislature, an ideology which blames the economically stricken for their decline, not Wall Street malfeasance or the crony favoritism practiced by leaders indebted to corporate contributors.

In late 2012, the current Emergency Manager Law was passed by the GOP-controlled Michigan legislature and signed into law by Gov. Rick Snyder. It went into effect in early 2013, after the prior Emergency Manager Law was rejected in a Michigan voter referendum of November, 2012. The new law pointedly blocked any future voter referendums.

Generally you can decry such measures as tyrannical due to the seemingly arbitrary suspension of democracy in such principalities, but events that transpired in Flint, Michigan, one of the captive cities, this over the last two years, speaks volumes of the vicious and mindless cruelty of emergency managers and their overseers in state government, indicated by a lack of nurture or concern for the people.

In April 2014, officials in the city of Flint, namely the emergency manager who is only accountable to Governor Rick Snyder, switched Flint's water source from Detroit's water system of lake water to the Flint River to save money. Although river water is known to be more corrosive, "no water treatment was needed," the emergency manager and Snyder opined. In fact, the emergency manager sold the pipe between Flint and Detroit, severing any connection to the safe Detroit water.

Sure enough, the lead soldering in the Flint pipes began leaching, mixing lead with the corrosive river water. It was immediately determined by the General Motors plant in Flint that the water from the Flint River was so caustic that it was corroding car parts, so they adopted an alternative source. The people of Flint did not have the same resources to switch.

Skin lesions, hair loss, learning disabilities and behavioral problems became more common.

Blood tests began revealing the presence of lead in the blood of children. During the months of July, August and September, 2014, the Michigan Department of Health and Human Services (DHHS) internally revealed that lead poisoning rates "were higher than usual for children under age 16 living in the City of Flint. When the Michigan department of Environmental Quality (MDEQ) officials, who reported directly to Governor Rick Snyder, repeatedly and falsely stated that no spike in blood lead levels (BLL) of children had occurred, DHHS officials did not object.

For a whole year DHHS officials stonewalled efforts by outside researchers, and even released incomplete data to cover up the evidence. Only when the incidence of childhood lead poisoning skyrocketed above 10% in the two Flint zip codes with the highest water lead risk did they reveal the truth, and it wasn't until October of 2015 that the county declared a public health emergency.

The Rick Snyder administration was aware that the lead level in the drinking water went from 6 parts per million to 11 parts per million in just 6 months in 2014 and 2015. Even so in July of 2015 Brad Wurfel of the Michigan Department of Environmental Quality, reporting directly to Rick Snyder, announced, "relax … There is no broad problem right now that we've seen with lead in the drinking water in Flint."

Governor Rick Snyder allowed Flint to drink toxic water despite repeated warnings. He knew that there were elevated lead levels in the blood and had to know that brain damage in children is life-long and irreversible, most especially for children under age six. Flint pediatrician, Dr. Mona Hanna-Attista did painstaking research showing unsafe lead levels in Flint's children. Her September of 2015 report even then was denounced by Michigan state agencies.

"Lead is probably one of the most damning things you can do to a population," Hanna-Attisha said.

In contrast to the Snyder administration's insulting denunciations and bluster, her words were measured in sadness for the many stricken children, "We wouldn't expect this to happen in 2015, especially when we could have easily used corrosion control to prevent it."

Meanwhile Rick Snyder distanced himself from the suffering by appointing a communication professional to handle the Flint lead poisoning debacle, while his Board of State Canvassers voted to reject a recall petition filed by a Detroit pastor.

Editorial: Hasten help to Flint (Detroit News)

http://www.detroitnews.com/story/opinion/editorials/2015/12/22/editorial-hasten-help-flint/77778316/

The Detroit News 11:30 p.m. EST December 22, 2015

Flint’s financial crisis became a health crisis with the decision to unhook from the Detroit water system and start delivering water to residents itself. Since the city was under state emergency management at the time, much of the responsibility for fixing the problem rests with Lansing.

One way it could help the city find the resources to address its lead-tainted water pipes is to help seek relief from debts owed to the federal government.

When Flint switched away from using Detroit water, it began drawing water from the Flint River. To put it mildly, it was a mistake that residents are paying in several ways.

Random testing found high levels of lead in children with the source traced to the Flint water system. An estimated 30,000 of the city’s 102,000 residents were using and drinking contaminated water. That includes pregnant women, patients at hospitals, schoolchildren and seniors.

Switching back to the Detroit water system was just the first step. Now, the city has to work out the financial details to improve the safety of the water and replace thousands of lead-contaminated pipes that connect the main water lines to individual homes.

It also has to deal with the lingering effects of lead on the health of its children.

Some assistance is on the way in a two-pronged effort to forgive about $22 million in federal loans Flint has had to take out, and also secure future loans that can be forgiven.

State officials, who administer the federal funds, say this is being done but have not given a timetable.

Rep. Dan Kildee, D-Flint, is working at the federal level to get loan forgiveness. He notes that this in itself will help reduce water rates for residents because of what they were paying to eliminate the debt. Water rates increased 35 percent because of the switch.

The state is expected to provide some help. Gov. Rick Snyder wants to cover half — $6 million — of the cost for switching back to Detroit water. Flint will pay $2 million, and $4 million will come from the Charles Stewart Mott Foundation.

But the debt relief is also a critical financial factor and one that should be hastened.

Kildee stresses that local officials and citizens had no say in the water system switch because it was authorized by an emergency manager, who was making all of the economic decisions.

“It was just a bean counter decision, but he should have started with the question is the water safe? Safety should have been paramount,” Kildee says.

“None of the residents had anything to do with this, but they’re paying the highest price.”

Recovering from the decision will be expensive and warrants considerable help from the state.

Paul Egan, Detroit Free Press 10:09 a.m. EST December 24, 2015

LANSING — Lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the Michigan Department of Environmental Quality to wrongly indicate the water was safe to drink, e-mails show.

The records — obtained by the Michigan ACLU and by Marc Edwards, a Virginia Tech researcher who helped raise concerns about Flint's water — show how state officials first appear to have encouraged the City of Flint to find water samples with low lead levels and later told Flint officials to disqualify two samples with high readings. The move changed the overall lead level results to acceptable from unacceptable.

The e-mails also show that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency on Feb. 27 that Flint had "an optimized corrosion control program" to prevent lead from leaching into the drinking water from pipes, connections and fixtures. In fact, the city — disastrously — had no corrosion control program.

Why those DEQ officials took the actions they did is a question at the center of a tragedy that has left an unknown number of children and other Flint residents poisoned by lead, and has led to a federal lawsuit and calls for a U.S. Justice Department investigation. The questions surrounding the testing are in addition to the broader question of why Flint, which was under the control of a state-appointed emergency manager at the time, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

Brad Wurfel, a spokesman for DEQ Director Dan Wyant, declined to say Tuesday why Busch gave inaccurate information to the EPA, why another DEQ official told Flint officials he was hoping they would send him water samples showing low lead levels, or why the DEQ was strict in disqualifying certain water samples with high lead readings but not strict in disqualifying other samples showing low lead levels that did not appear to meet the sampling criteria.

"Most of these questions regard issues presently before the governor's independent after-action review panel," Wurfel told the Free Press in an e-mail. "We don't want to get in front of that review."

On June 25, Adam Rosenthal, of the DEQ's Office of Drinking Water and Municipal Assistance, sent an e-mail about the water samples, required under the federal Lead and Copper Rule, to Michael Glasgow, a utilities administrator with the City of Flint.

The Michigan Department of Environmental Quality revised downward the results of water samples in Flint. (Photo: Detroit Free Press file photo)

"Just wanted to remind you/confirm that Flint is on track for a few items," Rosenthal wrote in the e-mail, which he copied to two other DEQ officials.

"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they are will be (sic) below the AL (action level) for lead," the e-mail said. "As of now with 39 results, Flint's 90th percentile is over the AL for lead."

If 100 lead-in-water samples were listed in ascending order, the 90th percentile would be the

90th sample, meaning 10 samples would have higher readings. To stay below the "action level," which triggers requirements for public notification and steps to reduce the amount of lead in the water, the 90th percentile for Flint's drinking water samples had to be at or below 15 parts per billion. To put it another way, Flint's water would reach an action level if more than 10% of the samples exceed 15 parts per billion.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said there is only one way to read the Rosenthal e-mail.

"The MDEQ informed the City of Flint that they were in danger of going in violation, and they asked for low samples," Mays told the Free Press.

Wurfel wouldn't comment when asked if that's how the e-mail should be interpreted. Rosenthal did not respond to an e-mail seeking comment. Busch, who was copied on the e-mail Rosenthal sent to Flint, sent an automated e-mail reply that said he is out of the office until Jan. 4.

Had Flint's water sampling come in above the action level, it would have triggered action in July. Instead, it was not until October, after blood test results showed elevated lead levels in Flint children, that the DEQ admitted making a mistake about failing to require the addition of needed corrosion control chemicals to the Flint River water. The state also provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

The EPA requires that water sampling be done at "high-risk" locations whenever possible. To comply with that, the American Water Works Association says cities such as Flint should collect 50% of samples from homes with lead service lines. For the samples taken in 2015, the EPA rules also required that Flint sample the same 100 homes it sampled the previous year, between July and December of 2014.

But the City of Flint didn't get 100 samples in 2015. After receiving Rosenthal's e-mail expressing a hope for samples below the action level, the city in the next five days collected 30 additional samples, all of which were below the action level.

The DEQ decided that fewer than 100 samples would suffice because Flint's population had dropped below 100,000.

But Edwards said the smaller number of samples the DEQ allowed still should have come from the group of 100 homes tested a year earlier and should have all come from homes at high risk for lead.

The Michigan ACLU, and later the Flint Journal has reported that seven of the additional samples the city collected, or nearly 25% of them, came from a single stretch of Flushing Road in Flint, where the city had replaced a lengthy session of water main in 2007. Not surprisingly, all of those samples measured very low for lead.

In all, the newspaper reported, only 13 of the homes sampled were from the same list of 100 homes tested in 2014. All the homes that were sampled for a second time in 2015 had tested low for lead in 2014. None of the homes that in 2014 had lead levels above the 15 parts per billion action level were sampled a second time.

Edwards told the Free Press the samples were "cherry-picked," and that's a violation of federal law.

Wurfel would not comment when asked if that was the case.

Even then, the 71 samples Flint relied on would have put the city's water above the action level under the original report Flint prepared, dated July 28. Only after two high lead samples were disqualified at the direction of the DEQ, bringing the total number of samples used down to 69, was the water found to be at 11 parts per billion for lead, below the action level.

The revised report, dated Aug. 20, included the following comment from Flint utilities administrator Michael Glasgow: "Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria ..."

One of the disqualified samples, which showed lead at more than 100 parts per billion, came from the home of LeeAnne Walters. Walters had subsequently been retested with results coming back even worse and was visited by an EPA official in April. That EPA official, Miguel Del Toral, found that Walters' indoor plumbing was plastic and could not be the source of the high lead readings, as the DEQ had suggested to him.

The DEQ disqualified another high lead-level sample because it did not come from a single-family residence.

On Aug. 4, Walters, other community activists, and concerned pastors met at the Capitol with top aides to the governor and officials from the DEQ. Walters asked why her sample wasn't used and didn't get an explanation. She and others at the meeting say Harvey Hollins, an aide to Gov. Rick Snyder who was last week named the state's point man on the Flint water issue, instructed DEQ officials to get back to her on why her sample wasn't used.

Walters says she never received that explanation, but the DEQ produced a letter sent to Walters by e-mail in response to a FOIA request from Edwards.

In the Aug. 25 e-mail, Liane Shekter Smith, who at the time was the chief of the DEQ's Office of Drinking Water and Municipal Assistance but was reassigned in October after the DEQ acknowledged oversight mistakes in connection with Flint's drinking water, tells Walters her results were disqualified because she uses a water filter.

Walters said that she had been instructed to remove the filter before taking any water samples and always did so.

Though it was strict in disqualifying the high samples from Walters, the DEQ did not strictly enforce other requirements related to the samples, such as that they all come from the same group of homes sampled a year earlier, or that they come from homes at high risk for lead.

"The state is the one monitoring these decisions," Walters said. "They should be doing their job accurately. Someone should be holding them accountable for not doing things the way they were supposed to."

Questions over emergency manager law arise in Flint water rates lawsuit (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/questions_arise_regarding_publ.html

By Amanda Emery | aemery@mlive.com

on December 23, 2015 at 10:47 AM, updated December 23, 2015 at 8:51 PM

FLINT, MI — A Genesee County judge has ruled the city can continue shutting off water to Flint customers who haven't paid their bills since September.

Circuit Court Judge Archie Hayman on Tuesday, Dec. 22, said the city of Flint is mostly complying with some portions of his injunction in a lawsuit over Flint's past water rate increases but needs to complete others.

In September, the city started sending water bills reflecting the lower rates ordered by Hayman. In December, the city started sending shut-off notices to residents who hadn't paid the new lower bills.

Attorney Val Washington, who is representing Flint residents in the class-action lawsuit, which claims the city illegally raised rates, has questioned whether the city is complying with Hayman's August injunction.

Hayman ruled Tuesday there could be no shut-offs for past-due delinquencies, with the exception of those who haven't paid their bills since September.

Hayman also said, although the city has adjusted rates from Sept. 16, 2011, to July 1, 2012, those adjustments applied only to the water commodity and not the service charges for that period.

"The courts' intent was to have that 35 percent applied for both," Hayman said.

Hayman also ordered the city and Washington to meet to negotiate on how to pay back $15.7 million that was "wrongfully taken" from water and sewer funds. He said the City Council should meet to discuss the transfer of the funds.

"As it stands right now, I want my injunction complied with," Hayman said in court.

The water rate saga will continue in court over questions on whether the water rates set by an emergency manager are valid after an earlier version of Michigan's emergency manager law was repealed.

"It raises the issue about Public Act 4," Washington said. "Any actions taken ... they went away when the law went away."

Washington argues that the actions under the law are not valid, so a rate set July 1, 2012, wouldn't survive the repeal of the act.

City Administrator Natasha Henderson said the city is pleased with the decision.

"The city is pleased that Judge Hayman reconsidered the determination made in his preliminary injunction and looks forward to the financial stability his revised ruling will provide the city," Henderson said in a statement. "The city appreciates the work of City Attorney Anthony Chubb and his team."

Flint City Councilman Eric Mays said he looks forward to a special meeting or executive session to discuss the transfer of the water funds.

The judge also ordered the city to set up a separate account for water funds so it can be seen what the funds are used for. Hayman said the funds could not be used to pay general obligations of the city and are to be used for operations, maintenance and administration.

The next court date to discuss the impact of the repeal of the emergency manager law and how that will affect the improper rate increase might be in the coming month, Washington said.

Flint judge sides with city over water shutoffs (WLNS 6)

http://wlns.com/2015/12/23/flint-judge-sides-with-city-over-water-shutoffs/

WLNS Web Staff Published: December 23, 2015, 9:32 pm

FLINT, MI (WLNS) – A Flint judge has sided with the city in a legal battle over disconnecting water for those who haven’t paid their bills.

Back in August Genesee County circuit court judge ordered flint to cease water shut-offs until it rolled back a 2011 rate hike.

The city sent out bills reflecting the court-ordered lower rate in back in September and also gave shut-off notices for those who didn't pay their new, lower bills.

But now some legal experts say the city has not compiled with a judge's original orders.

This ruling comes as the city continues to re-solve a water crisis after it was discovered there was un-safe amounts of lead in the drinking water.

Congressman calls for state water crisis health fund on Rachel Maddow show (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/congressman_continues_call_for.html

By Gary Ridley | gridley@mlive.com

on December 24, 2015 at 9:33 AM, updated December 24, 2015 at 9:40 AM

FLINT, MI – U.S. Rep. Dan Kildee took to the Rachel Maddow show to continue his call for the state to create a health fund to help Flint's youngest residents potentially affected by the city's water crisis.

Kildee, D-Flint Township, appeared on the MSNBC pundit's program Wednesday, Dec. 23, and called on Gov. Rick Snyder to provide funding for a program that would provide continued health assistance for Flint children who have been diagnosed with elevated blood lead levels.

"We need more than an apology and an acknowledgement that they failed," Kildee said of state leaders. "We need them to make it right."

It was the fourth time in the past two weeks that Flint's water crisis has been prominently featured on the Rachel Maddow show.

Kildee said he hasn't yet put a price tag on the health fund program, but he said it should provide health, nutritional and educational support for children under 5 years old. He said he has plans to continue meeting with health officials to develop the specifics of the fund.

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

We need more than an apology and an acknowledgement that they failed.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply. Even though the city reconnected to the Detroit water system in October, local officials have advised Flint residents not to drink city water unless they are using lead-clearing filters.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children younger than 5 from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase."

The Centers for Disease Control and Prevention said children younger than 6 are among those at high risk for the effects of lead poisoning. U.S. Census Bureau estimates show there are 6,000 to 8,000 children younger than 5 in the city.

Snyder's office said they are continuing to work with local leaders to provide a solution to the city's water problem.

"Gov. Snyder is committed to working with Mayor Weaver and city leaders to do what is necessary to protect the health of Flint residents," said Snyder's Press Secretary Dave Murray. "We're working to build upon the work that is already in progress as part of the Governor's action plan and the $10 million provided for the reconnection to Detroit water, filters for residents and efforts to improve the city's water infrastructure."

- Maddow, reported Tuesday, Dec. 22, on documents released this week by Virginia Tech university professor Marc Edwards, which show state health officials didn't immediately inform the public after finding evidence of rising blood lead levels in Flint two months before the problem was exposed by a Flint pediatrician.
- On Friday, Dec. 18, Maddow interviewed Hanna-Attisha, director of Hurley Medical Center's Pediatric Residency Program and the doctor whose study on rising blood lead levels in Flint children helped force the city and state to stop use of the Flint River for drinking water.
- On Dec. 15, Flint Mayor Karen Weaver appeared on the Maddow show to discuss her push to have Flint declared a federal disaster area because of damage river water has caused to Flint children and to the city's infrastructure.

Maddow's entire interview can be viewed here.

Suffer, Flint's Children (Dissident Voice)

http://dissidentvoice.org/2015/12/suffer-flints-children/

by James Hoover / December 24th, 2015

It is quite shocking that no one from the Rick Snyder administration in Michigan is on trial, impeached or in jail for charges such as felony child endangerment. Such charges involve a person engaged in conduct that places a child in imminent danger of death, bodily injury, or physical or mental impairment. It is a charge that can involve an act or even an omission.

The determination usually looks at two different aggravating factors, the first being intent. Was the conduct merely negligent or reckless, or willful or intentional? The former is a misdemeanor, the latter, a felony. The second factor is the degree of risk: the higher the risk, the higher the charge.

Such should be the consideration in the lead poisoning of children by corrosive Flint River water in Flint, Michigan. The switch to Flint River water was perpetrated by an emergency manager in Flint, who changed Flint's water source to the Flint River without treating the river water, something experience teaches us is almost always necessary. He was appointed by and reported to Michigan Governor Rick Snyder. Conditions of risk were perpetuated over some 13 months after symptoms and subsequent blood tests showed high levels of lead poisoning in Flint children.

Such deleterious results too often come with a tyranny that suspension of democracy can bring. In a number of Michigan cities, emergency managers appointed under the authority of Michigan's so-called Emergency Manager Law, replace elected representatives, making changes impacting the health and welfare of citizens. In effect, citizens of affected cities and school districts become chattels of one would-be autocrat, appointed by Governor Rick Snyder.

A temporary solution has become permanent in such principalities in an area suffering under a shift in political power that brought labor's decline and management's ascent as money took hold of government.

An area nicknamed the Rust Belt, formerly known as the industrial heartland of America, is a belt that stretches along the Southern boundaries of the Great Lakes, also covering the Midwest States, New York areas and eastern Wisconsin. It is marked by economic decline, fleeing populations, and urban decay due to numerous economic factors, including automation, globalization, the *Wall Street* recession, and technological change. But many of the factors were politically imposed by the exigencies of shifting power from middle class citizens to Wall Street and crony capitalists.

In 2008, such a shift was evident when the financial abuse of Wall Street bankers resulted in the threatened bankruptcies of giant banks. The reaction of the federal government was multi-billion dollar bailouts, this while stricken consumers were forgotten, as well as citizens of already bankrupt cities throughout the so-called Rust Belt who went even deeper into economic ruin. Such troubled citizens were met with even further cuts, a result of GOP-driven austerity measures, most involving cuts to federal support for local economic services.

The unequal treatment played out with bailouts of monolithic banks and the smack-down of citizens of cities and schools considered wasteful and reckless.

Emergency management laws have been Michigan's answer to financial decline in many cities throughout the state. Currently, Hamtramck, Detroit, Flint, Pontiac, Benton Harbor, Allen Park and the school districts of Muskegon Heights, Highland Park and Detroit are under the control of an emergency manager.

You might argue that the elected leaders of such bankrupt Michigan cities must be replaced with responsible leaders, but such leadership seems to be an excuse for imposing the conservative ideology of governors such as Snyder and a GOP legislature, an ideology which blames the economically stricken for their decline, not Wall Street malfeasance or the crony favoritism practiced by leaders indebted to corporate contributors.

In late 2012, the current Emergency Manager Law was passed by the GOP-controlled Michigan legislature and signed into law by Gov. Rick Snyder. It went into effect in early 2013, after the prior Emergency Manager Law was rejected in a Michigan voter referendum of November, 2012. The new law pointedly blocked any future voter referendums.

Generally you can decry such measures as tyrannical due to the seemingly arbitrary suspension of democracy in such principalities, but events that transpired in Flint, Michigan, one of the captive cities, this over the last two years, speaks volumes of the vicious and mindless cruelty of emergency managers and their overseers in state government, indicated by a lack of nurture or concern for the people.

In April 2014, officials in the city of Flint, namely the emergency manager who is only accountable to Governor Rick Snyder, switched Flint's water source from Detroit's water system of lake water to the Flint River to save money. Although river water is known to be more corrosive, "no water treatment was needed," the emergency manager and Snyder opined. In fact, the emergency manager sold the pipe between Flint and Detroit, severing any connection to the safe Detroit water.

Sure enough, the lead soldering in the Flint pipes began leaching, mixing lead with the corrosive river water. It was immediately determined by the General Motors plant in Flint that the water from the Flint River was so caustic that it was corroding car parts, so they adopted an alternative source. The people of Flint did not have the same resources to switch.

Skin lesions, hair loss, learning disabilities and behavioral problems became more common. Blood tests began revealing the presence of lead in the blood of children. During the months of July, August and September, 2014, the Michigan Department of Health and Human Services (DHHS) internally revealed that lead poisoning rates "were higher than usual for children under age 16 living in the City of Flint. When the Michigan department of Environmental Quality

(MDEQ) officials, who reported directly to Governor Rick Snyder, repeatedly and falsely stated that no spike in blood lead levels (BLL) of children had occurred, DHHS officials did not object.

For a whole year DHHS officials stonewalled efforts by outside researchers, and even released incomplete data to cover up the evidence. Only when the incidence of childhood lead poisoning skyrocketed above 10% in the two Flint zip codes with the highest water lead risk did they reveal the truth, and it wasn't until October of 2015 that the county declared a public health emergency.

The Rick Snyder administration was aware that the lead level in the drinking water went from 6 parts per million to 11 parts per million in just 6 months in 2014 and 2015. Even so in July of 2015 Brad Wurfel of the Michigan Department of Environmental Quality, reporting directly to Rick Snyder, announced, "relax … There is no broad problem right now that we've seen with lead in the drinking water in Flint."

Governor Rick Snyder allowed Flint to drink toxic water despite repeated warnings. He knew that there were elevated lead levels in the blood and had to know that brain damage in children is life-long and irreversible, most especially for children under age six. Flint pediatrician, Dr. Mona Hanna-Attista did painstaking research showing unsafe lead levels in Flint's children. Her September of 2015 report even then was denounced by Michigan state agencies.

"Lead is probably one of the most damning things you can do to a population," Hanna-Attisha said.

In contrast to the Snyder administration's insulting denunciations and bluster, her words were measured in sadness for the many stricken children, "We wouldn't expect this to happen in 2015, especially when we could have easily used corrosion control to prevent it."

Meanwhile Rick Snyder distanced himself from the suffering by appointing a communication professional to handle the Flint lead poisoning debacle, while his Board of State Canvassers voted to reject a recall petition filed by a Detroit pastor.

Paul Egan, Detroit Free Press 10:09 a.m. EST December 24, 2015

LANSING — Lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the Michigan Department of Environmental Quality to wrongly indicate the water was safe to drink, e-mails show.

The records — obtained by the Michigan ACLU and by Marc Edwards, a Virginia Tech researcher who helped raise concerns about Flint's water — show how state officials first appear to have encouraged the City of Flint to find water samples with low lead levels and later told Flint officials to disqualify two samples with high readings. The move changed the overall lead level results to acceptable from unacceptable.

The e-mails also show that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency on Feb. 27 that Flint had "an optimized corrosion control program" to prevent lead from leaching into the drinking water from pipes, connections and fixtures. In fact, the city — disastrously — had no corrosion control program.

Why those DEQ officials took the actions they did is a question at the center of a tragedy that has left an unknown number of children and other Flint residents poisoned by lead, and has led to a federal lawsuit and calls for a U.S. Justice Department investigation. The questions surrounding the testing are in addition to the broader question of why Flint, which was under the control of a state-appointed emergency manager at the time, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

Brad Wurfel, a spokesman for DEQ Director Dan Wyant, declined to say Tuesday why Busch gave inaccurate information to the EPA, why another DEQ official told Flint officials he was hoping they would send him water samples showing low lead levels, or why the DEQ was strict in disqualifying certain water samples with high lead readings but not strict in disqualifying other samples showing low lead levels that did not appear to meet the sampling criteria.

"Most of these questions regard issues presently before the governor's independent after-action review panel," Wurfel told the Free Press in an e-mail. "We don't want to get in front of that review."

On June 25, Adam Rosenthal, of the DEQ's Office of Drinking Water and Municipal Assistance, sent an e-mail about the water samples, required under the federal Lead and Copper Rule, to Michael Glasgow, a utilities administrator with the City of Flint.

The Michigan Department of Environmental Quality revised downward the results of water samples in Flint. (Photo: Detroit Free Press file photo)

"Just wanted to remind you/confirm that Flint is on track for a few items," Rosenthal wrote in the e-mail, which he copied to two other DEQ officials.

"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they are will be (sic) below the AL (action level) for lead," the e-mail said. "As of now with 39 results, Flint's 90th percentile is over the AL for lead."

If 100 lead-in-water samples were listed in ascending order, the 90th percentile would be the 90th sample, meaning 10 samples would have higher readings. To stay below the "action level," which triggers requirements for public notification and steps to reduce the amount of lead in the water, the 90th percentile for Flint's drinking water samples had to be at or below 15 parts per billion. To put it another way, Flint's water would reach an action level if more than 10% of the samples exceed 15 parts per billion.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said there is only one way to read the Rosenthal e-mail.

"The MDEQ informed the City of Flint that they were in danger of going in violation, and they asked for low samples," Mays told the Free Press.

Wurfel wouldn't comment when asked if that's how the e-mail should be interpreted. Rosenthal did not respond to an e-mail seeking comment. Busch, who was copied on the e-mail Rosenthal sent to Flint, sent an automated e-mail reply that said he is out of the office until Jan. 4.

Had Flint's water sampling come in above the action level, it would have triggered action in July. Instead, it was not until October, after blood test results showed elevated lead levels in Flint children, that the DEQ admitted making a mistake about failing to require the addition of needed corrosion control chemicals to the Flint River water. The state also provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

The EPA requires that water sampling be done at "high-risk" locations whenever possible. To comply with that, the American Water Works Association says cities such as Flint should collect 50% of samples from homes with lead service lines. For the samples taken in 2015, the EPA rules also required that Flint sample the same 100 homes it sampled the previous year, between July and December of 2014.

But the City of Flint didn't get 100 samples in 2015. After receiving Rosenthal's e-mail expressing a hope for samples below the action level, the city in the next five days collected 30 additional samples, all of which were below the action level.

The DEQ decided that fewer than 100 samples would suffice because Flint's population had dropped below 100,000.

But Edwards said the smaller number of samples the DEQ allowed still should have come from the group of 100 homes tested a year earlier and should have all come from homes at high risk for lead.

The Michigan ACLU, and later the Flint Journal has reported that seven of the additional samples the city collected, or nearly 25% of them, came from a single stretch of Flushing Road in Flint, where the city had replaced a lengthy session of water main in 2007. Not surprisingly, all of those samples measured very low for lead.

In all, the newspaper reported, only 13 of the homes sampled were from the same list of 100 homes tested in 2014. All the homes that were sampled for a second time in 2015 had tested low for lead in 2014. None of the homes that in 2014 had lead levels above the 15 parts per billion action level were sampled a second time.

Edwards told the Free Press the samples were "cherry-picked," and that's a violation of federal law.

Wurfel would not comment when asked if that was the case.

Even then, the 71 samples Flint relied on would have put the city's water above the action level under the original report Flint prepared, dated July 28. Only after two high lead samples were disqualified at the direction of the DEQ, bringing the total number of samples used down to 69, was the water found to be at 11 parts per billion for lead, below the action level.

The revised report, dated Aug. 20, included the following comment from Flint utilities administrator Michael Glasgow: "Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria ..."

One of the disqualified samples, which showed lead at more than 100 parts per billion, came from the home of LeeAnne Walters. Walters had subsequently been retested with results coming back even worse and was visited by an EPA official in April. That EPA official, Miguel Del Toral, found that Walters' indoor plumbing was plastic and could not be the source of the high lead readings, as the DEQ had suggested to him.

The DEQ disqualified another high lead-level sample because it did not come from a single-family residence.

On Aug. 4, Walters, other community activists, and concerned pastors met at the Capitol with top aides to the governor and officials from the DEQ. Walters asked why her sample wasn't used and didn't get an explanation. She and others at the meeting say Harvey Hollins, an aide to Gov. Rick Snyder who was last week named the state's point man on the Flint water issue, instructed DEQ officials to get back to her on why her sample wasn't used.

Walters says she never received that explanation, but the DEQ produced a letter sent to Walters by e-mail in response to a FOIA request from Edwards.

In the Aug. 25 e-mail, Liane Shekter Smith, who at the time was the chief of the DEQ's Office of Drinking Water and Municipal Assistance but was reassigned in October after the DEQ acknowledged oversight mistakes in connection with Flint's drinking water, tells Walters her results were disqualified because she uses a water filter.

Walters said that she had been instructed to remove the filter before taking any water samples and always did so.

Though it was strict in disqualifying the high samples from Walters, the DEQ did not strictly enforce other requirements related to the samples, such as that they all come from the same group of homes sampled a year earlier, or that they come from homes at high risk for lead.

"The state is the one monitoring these decisions," Walters said. "They should be doing their job accurately. Someone should be holding them accountable for not doing things the way they were supposed to."

Questions over emergency manager law arise in Flint water rates lawsuit (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/questions_arise_regarding_publ.html

By Amanda Emery | aemery@mlive.com

on December 23, 2015 at 10:47 AM, updated December 23, 2015 at 8:51 PM

FLINT, MI — A Genesee County judge has ruled the city can continue shutting off water to Flint customers who haven't paid their bills since September.

Circuit Court Judge Archie Hayman on Tuesday, Dec. 22, said the city of Flint is mostly complying with some portions of his injunction in a lawsuit over Flint's past water rate increases but needs to complete others.

In September, the city started sending water bills reflecting the lower rates ordered by Hayman. In December, the city started sending shut-off notices to residents who hadn't paid the new lower bills.

Attorney Val Washington, who is representing Flint residents in the class-action lawsuit, which claims the city illegally raised rates, has questioned whether the city is complying with Hayman's August injunction.

Hayman ruled Tuesday there could be no shut-offs for past-due delinquencies, with the exception of those who haven't paid their bills since September.

Hayman also said, although the city has adjusted rates from Sept. 16, 2011, to July 1, 2012, those adjustments applied only to the water commodity and not the service charges for that period.

"The courts' intent was to have that 35 percent applied for both," Hayman said.

Hayman also ordered the city and Washington to meet to negotiate on how to pay back $15.7 million that was "wrongfully taken" from water and sewer funds. He said the City Council should meet to discuss the transfer of the funds.

"As it stands right now, I want my injunction complied with," Hayman said in court.

The water rate saga will continue in court over questions on whether the water rates set by an emergency manager are valid after an earlier version of Michigan's emergency manager law was repealed.

"It raises the issue about Public Act 4," Washington said. "Any actions taken ... they went away when the law went away."

Washington argues that the actions under the law are not valid, so a rate set July 1, 2012, wouldn't survive the repeal of the act.

City Administrator Natasha Henderson said the city is pleased with the decision.

"The city is pleased that Judge Hayman reconsidered the determination made in his preliminary injunction and looks forward to the financial stability his revised ruling will provide the city," Henderson said in a statement. "The city appreciates the work of City

Attorney Anthony Chubb and his team."

Flint City Councilman Eric Mays said he looks forward to a special meeting or executive session to discuss the transfer of the water funds.

The judge also ordered the city to set up a separate account for water funds so it can be seen what the funds are used for. Hayman said the funds could not be used to pay general obligations of the city and are to be used for operations, maintenance and administration.

The next court date to discuss the impact of the repeal of the emergency manager law and how that will affect the improper rate increase might be in the coming month, Washington said.

Flint judge sides with city over water shutoffs (WLNS 6)

http://wlns.com/2015/12/23/flint-judge-sides-with-city-over-water-shutoffs/

WLNS Web Staff Published: December 23, 2015, 9:32 pm

FLINT, MI (WLNS) – A Flint judge has sided with the city in a legal battle over disconnecting water for those who haven't paid their bills.

Back in August Genesee County circuit court judge ordered flint to cease water shut-offs until it rolled back a 2011 rate hike.

The city sent out bills reflecting the court-ordered lower rate in back in September and also gave shut-off notices for those who didn't pay their new, lower bills.

But now some legal experts say the city has not compiled with a judge's original orders.

This ruling comes as the city continues to re-solve a water crisis after it was discovered there was un-safe amounts of lead in the drinking water.

Congressman calls for state water crisis health fund on Rachel Maddow show (mlive.com)

http://www.mlive.com/news/flint/index.ssf/2015/12/congressman_continues_call_for.html

By Gary Ridley | gridley@mlive.com

on December 24, 2015 at 9:33 AM, updated December 24, 2015 at 9:40 AM

FLINT, MI – U.S. Rep. Dan Kildee took to the Rachel Maddow show to continue his call for the state to create a health fund to help Flint's youngest residents potentially affected by the city's water crisis.

Kildee, D-Flint Township, appeared on the MSNBC pundit's program Wednesday, Dec. 23, and called on Gov. Rick Snyder to provide funding for a program that would provide continued health assistance for Flint children who have been diagnosed with elevated blood lead levels.

"We need more than an apology and an acknowledgement that they failed," Kildee said of state leaders. "We need them to make it right."

It was the fourth time in the past two weeks that Flint's water crisis has been prominently featured on the Rachel Maddow show.

Kildee said he hasn't yet put a price tag on the health fund program, but he said it should provide health, nutritional and educational support for children under 5 years old. He said he has plans to continue meeting with health officials to develop the specifics of the fund.

Flint changed its water source from Lake Huron water purchased from the Detroit water system to the Flint River in April 2014, a decision made while the city was being run by a state-appointed emergency manager.

We need more than an apology and an acknowledgement that they failed.

State regulators never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply. Even though the city reconnected to the Detroit water system in October, local officials have advised Flint residents not to drink city water unless they are using lead-clearing filters.

Earlier this month, Hanna-Attisha told The Flint Journal-MLive that she was continuing to analyze data comparing the blood lead levels of Flint children younger than 5 from January to September 2013 and from January to September 2015, nine months in which the city was using the Flint River as its water source.

"The percentage of children with elevated blood levels significantly increased after the water source changed," Hurley said in a new release. "Results showed the incidence of elevated blood lead levels increased from 2.4 to 4.9 percent ... and city areas with the highest water lead levels experienced a 6.6 percent increase."

The Centers for Disease Control and Prevention said children younger than 6 are among those at high risk for the effects of lead poisoning. U.S. Census Bureau estimates show there are 6,000 to 8,000 children younger than 5 in the city.

Snyder's office said they are continuing to work with local leaders to provide a solution to the city's water problem.

"Gov. Snyder is committed to working with Mayor Weaver and city leaders to do what is necessary to protect the health of Flint residents," said Snyder's Press Secretary Dave Murray. "We're working to build upon the work that is already in progress as part of the Governor's action plan and the $10 million provided for the reconnection to Detroit water, filters for residents and efforts to improve the city's water infrastructure."

- Maddow, reported Tuesday, Dec. 22, on documents released this week by Virginia Tech university professor Marc Edwards, which show state health officials didn't immediately inform the public after finding evidence of rising blood lead levels in Flint two months before the problem was exposed by a Flint pediatrician.
- On Friday, Dec. 18, Maddow interviewed Hanna-Attisha, director of Hurley Medical Center's Pediatric Residency Program and the doctor whose study on rising blood lead levels in Flint children helped force the city and state to stop use of the Flint River for drinking water.
- On Dec. 15, Flint Mayor Karen Weaver appeared on the Maddow show to discuss her push to have Flint declared a federal disaster area because of damage river water has caused to Flint children and to the city's infrastructure.

Maddow's entire interview can be viewed here.

Suffer, Flint's Children (Dissident Voice)

http://dissidentvoice.org/2015/12/suffer-flints-children/

by James Hoover / December 24th, 2015

It is quite shocking that no one from the Rick Snyder administration in Michigan is on trial, impeached or in jail for charges such as felony child endangerment. Such charges involve a person engaged in conduct that places a child in imminent danger of death, bodily injury, or physical or mental impairment. It is a charge that can involve an act or even an omission.

The determination usually looks at two different aggravating factors, the first being intent. Was the conduct merely negligent or reckless, or willful or intentional? The former is a misdemeanor, the latter, a felony. The second factor is the degree of risk: the higher the risk, the higher the charge.

Such should be the consideration in the lead poisoning of children by corrosive Flint River water in Flint, Michigan. The switch to Flint River water was perpetrated by an emergency manager in Flint, who changed Flint's water source to the Flint River without treating the river water, something experience teaches us is almost always necessary. He was appointed by and reported to Michigan Governor Rick Snyder. Conditions of risk were perpetuated over some 13 months after symptoms and subsequent blood tests showed high levels of lead poisoning in Flint children.

Such deleterious results too often come with a tyranny that suspension of democracy can bring. In a number of Michigan cities, emergency managers appointed under the authority of Michigan's so-called Emergency Manager Law, replace elected representatives, making changes impacting the health and welfare of citizens. In effect, citizens of affected cities and school districts become chattels of one would-be autocrat, appointed by Governor Rick Snyder.

A temporary solution has become permanent in such principalities in an area suffering under a shift in political power that brought labor's decline and management's ascent as money took hold of government.

An area nicknamed the Rust Belt, formerly known as the industrial heartland of America, is a belt that stretches along the Southern boundaries of the Great Lakes, also covering the Midwest States, New York areas and eastern Wisconsin. It is marked by economic decline, fleeing populations, and urban decay due to numerous economic factors, including automation, globalization, the *Wall Street* recession, and technological change. But many of the factors were politically imposed by the exigencies of shifting power from middle class citizens to Wall Street and crony capitalists.

In 2008, such a shift was evident when the financial abuse of Wall Street bankers resulted in the threatened bankruptcies of giant banks. The reaction of the federal government was multi-billion dollar bailouts, this while stricken consumers were forgotten, as well as citizens of already bankrupt cities throughout the so-called Rust Belt who went even deeper into economic ruin. Such troubled citizens were met with even further cuts, a result of GOP-driven austerity measures, most involving cuts to federal support for local economic services.

The unequal treatment played out with bailouts of monolithic banks and the smack-down of citizens of cities and schools considered wasteful and reckless.

Emergency management laws have been Michigan's answer to financial decline in many cities throughout the state. Currently, Hamtramck, Detroit, Flint, Pontiac, Benton Harbor, Allen Park and the school districts of Muskegon Heights, Highland Park and Detroit are under the control of an emergency manager.

You might argue that the elected leaders of such bankrupt Michigan cities must be replaced with responsible leaders, but such leadership seems to be an excuse for imposing the conservative ideology of governors such as Snyder and a GOP legislature, an ideology which blames the economically stricken for their decline, not Wall Street malfeasance or the crony favoritism practiced by leaders indebted to corporate contributors.

In late 2012, the current Emergency Manager Law was passed by the GOP-controlled Michigan legislature and signed into law by Gov. Rick Snyder. It went into effect in early 2013, after the prior Emergency Manager Law was rejected in a Michigan voter referendum of November, 2012. The new law pointedly blocked any future voter referendums.

Generally you can decry such measures as tyrannical due to the seemingly arbitrary suspension of democracy in such principalities, but events that transpired in Flint, Michigan, one of the captive cities, this over the last two years, speaks volumes of the vicious and mindless cruelty of emergency managers and their overseers in state government, indicated by a lack of nurture or concern for the people.

In April 2014, officials in the city of Flint, namely the emergency manager who is only accountable to Governor Rick Snyder, switched Flint's water source from Detroit's water system of lake water to the Flint River to save money. Although river water is known to be more corrosive, "no water treatment was needed," the emergency manager and Snyder opined. In fact, the emergency manager sold the pipe between Flint and Detroit, severing any connection to the safe Detroit water.

Sure enough, the lead soldering in the Flint pipes began leaching, mixing lead with the corrosive river water. It was immediately determined by the General Motors plant in Flint that the water from the Flint River was so caustic that it was corroding car parts, so they adopted an alternative source. The people of Flint did not have the same resources to switch.

Skin lesions, hair loss, learning disabilities and behavioral problems became more common. Blood tests began revealing the presence of lead in the blood of children. During the months of July, August and September, 2014, the Michigan Department of Health and Human Services (DHHS) internally revealed that lead poisoning rates "were higher than usual for children under age 16 living in the City of Flint. When the Michigan department of Environmental Quality (MDEQ) officials, who reported directly to Governor Rick Snyder, repeatedly and falsely stated that no spike in blood lead levels (BLL) of children had occurred, DHHS officials did not object.

For a whole year DHHS officials stonewalled efforts by outside researchers, and even released incomplete data to cover up the evidence. Only when the incidence of childhood lead poisoning skyrocketed above 10% in the two Flint zip codes with the highest water lead risk did they reveal the truth, and it wasn't until October of 2015 that the county declared a public health emergency.

The Rick Snyder administration was aware that the lead level in the drinking water went from 6 parts per million to 11 parts per million in just 6 months in 2014 and 2015. Even so in July of 2015 Brad Wurfel of the Michigan Department of Environmental Quality, reporting directly to Rick Snyder, announced, "relax … There is no broad problem right now that we've seen with lead in the drinking water in Flint."

Governor Rick Snyder allowed Flint to drink toxic water despite repeated warnings. He knew that there were elevated lead levels in the blood and had to know that brain damage in children is life-long and irreversible, most especially for children under age six. Flint pediatrician, Dr. Mona Hanna-Attista did painstaking research showing unsafe lead levels in Flint's children. Her September of 2015 report even then was denounced by Michigan state agencies.

"Lead is probably one of the most damning things you can do to a population," Hanna-Attisha said.

In contrast to the Snyder administration's insulting denunciations and bluster, her words were measured in sadness for the many stricken children, "We wouldn't expect this to happen in 2015, especially when we could have easily used corrosion control to prevent it."

Meanwhile Rick Snyder distanced himself from the suffering by appointing a communication professional to handle the Flint lead poisoning debacle, while his Board of State Canvassers voted to reject a recall petition filed by a Detroit pastor.

> Great news...I just talked to Tom this AM and he said we can support the local efforts. We are going to need to define the scope of work rather quickly so that it is all included in the R5 Sampling QAPP that we are in the process of drafting. The QAPP includes sampling support for the Flint pipe rigs which means we would need to have all of this worked out and the QAPP in place before the pipe rig and local support can be provided. If we don't get this done asap, we'd have to do these separately (pipe rig stuff first). Not fatal if they are done separately, but it may delay the local work. I think it will move faster through the approval chain here if the local work is included in the same QAPP with the pipe rig support since there is a push to get that started asap.

I'm checking with Laura to get some leads on how to get this started. I can work on preparing a sampling plan, and rough budget for materials (which might be minimal). Any sampling plans or QAPPs you have that might serve as a useful template would be awesome.

Then once things ramp up in January we could be positioned to train and start sampling.

Subject: RE: Do you have Laura's phone number?
Importance: High

Just talked to Miguel, and previously with Darren. Here's the focus we envision, and what we can coordinate, and what we can't.

The overall need is ongoing chemical characterization of the distribution system water quality, so we can spot areas of concern (low or no chlorine residual, depletion of orthophosphate corrosion inhibitor, unstable pH, elevated iron levels from corrosion or suspended sediments, release of toxic trace metals from hydraulic or water quality upset events, potentially mobilization of microbes, etc.). That is not covered by the LCR-based monitoring, such as what Flint is doing. Ideally it would be more comprehensive, but all utilities and almost all states require or do the minimum required by the [weak] Federal regulations.

Having this network in place will be really critical in mapping risky water quality areas, and also tracking changes as the new KWA water comes on line. It will also be critical to give you the water chemistry background in areas with lead pipes and highest exposure risks, so we can compare measured lead levels in house sampling programs to the background water chemistry and determine if there are measurable water chemistry causes for elevated lead (or other toxic metal) release.

We will pick an assortment of regularly-accessible monitoring points that are our best guess of representative water quality, plus high risk (dead ends, high water age, low flow, high flow, oldest worst mains, observed microbial problem areas, near-plant area, etc.), and sample them regularly. Regularly is to be defined, maybe weekly?

The field sample collection team will need to do free chlorine residual and pH, though I do have a protocol for "preserving" pH that could enable them to be done in a good lab, with a little delay. Region 5 lab will provide bottles and will probably (need to confirm) handle shipping costs, but check into the cost of maybe sending re-usable coolers of samples, in case they can only furnish bottles. Sampling team will label samples, record site data and collection information and upload field measurements and sample data to monitoring database.

It's unlikely that R5 can do any microbial samples or DBP analyses, if those are of interest. If they are, that would have to be funded and arranged with a local collaborator, to be collected at the same time as the inorganic parameter water samples.

There is a new associate working with Miguel who can help manage data and coordinate with the Flint "local network." Note to selves, we should think of cute but effective acronym.

This would be an ongoing effort, because there can always be water quality changes that might be a sentinel for unhealthy conditions. For example, a flow reversal for a big fire might mobilize sediments or scour pipes and release metals like manganese, vanadium, barium, arsenic, etc. Same with air scour and disturbance from main breaks or repairs. As KWA water comes in, you'll really want to make sure there are minimal chemistry changes that could mobilize lead.

We can help a little with initial training and coordination, of course, but the effort will have to be maintained locally. There is an awful lot of good expertise, once trained and channeled.

So, local resources would consist of the samplers, advisors, analysts for pH, free chlorine, etc. , providing instruments to do the measurements, vehicles for travel, sampling logistical support, help with database development and analysis (statistical, mapping, whatever) and so on.

Is this a reasonable description? We can have a conference call at some point to further brainstorm, but is this enough to kind of get the ball rolling?

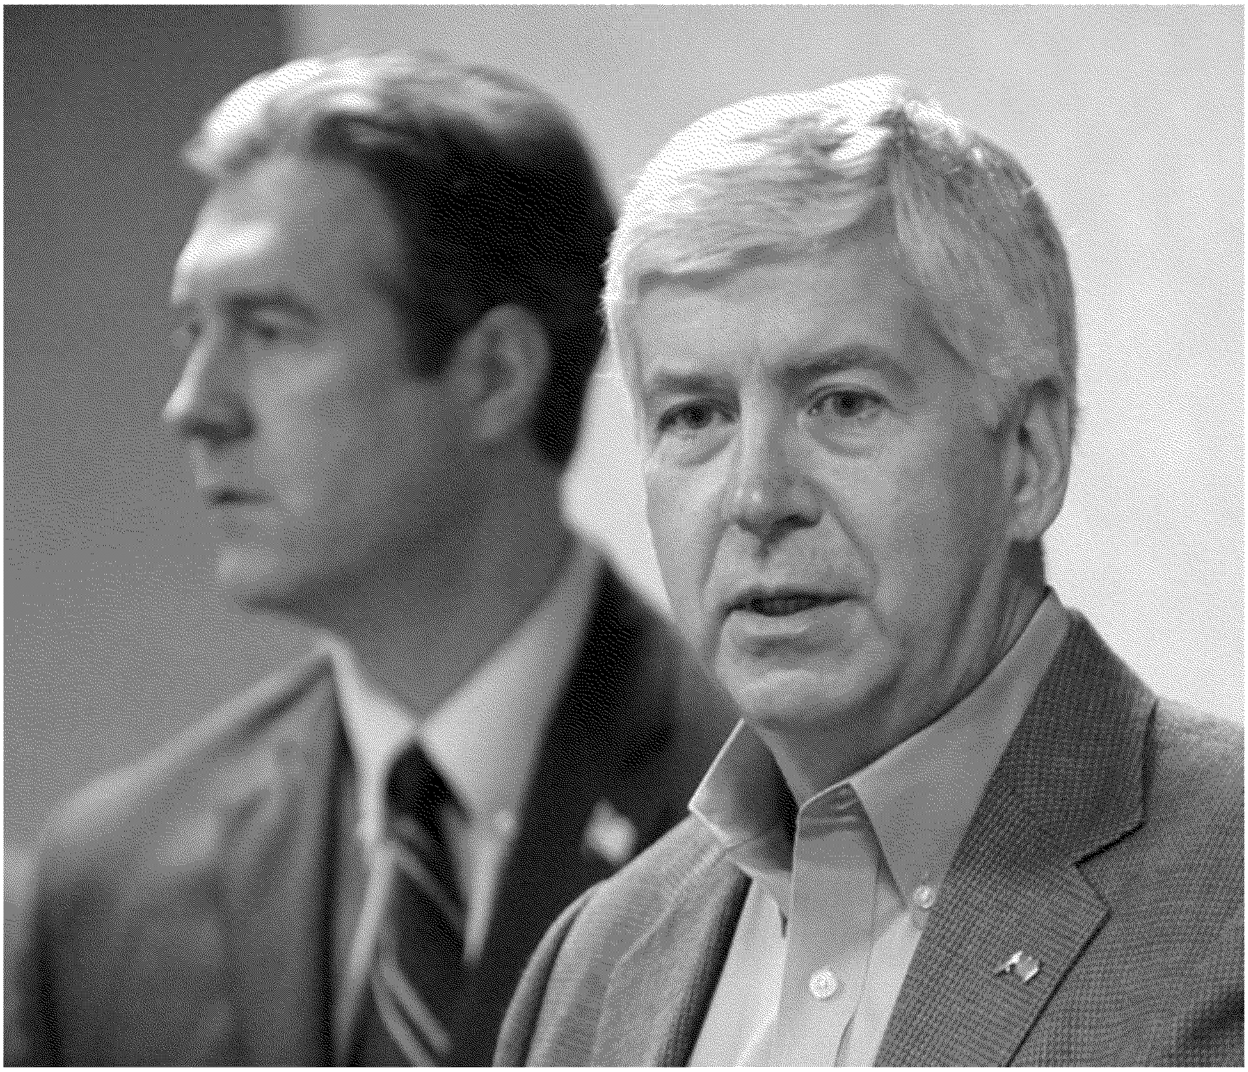
Flint water probe may unleash flood of findings on mistakes



Gov. Rick Snyder announces support of the city of Flint's plan to switch back to Detroit water due to high lead levels during a news conference with Mayor Dayne Walling in Flint on Oct. 8, 2015. *(MLive.com files)*

Print Email

By Tim Skubick | Politics Columnist for MLive.com MLive.com
on December 27, 2015 at 6:00 AM

It was very revealing how some readers responded to the post that the first lady thought her husband might die from a blood clot. Instead of reflecting on the gravity of that story, lots of folks wanted to beat up on the governor for allegedly poisoning the kids in Flint with lead.

Make no mistake: The Snyder administration did not experience its finest hour in its handling — critics would say bungling — of the Flint water contamination problem.

Much like the old Watergate hearings, where everyone was asked what they knew and when they knew it, the same penetrating question is being asked about this story.

The governor concedes it was the biggest challenge he faced in 2015 and perhaps for his entire term in office.

For those of you who missed it, when the decision was made to shift from Detroit water to H20 from the Flint River, residents immediately complained about the quality of the new supply. No one knew at the time there was lead in the water, but the administration's first response was that there was no problem.

And it wasn't until a local doctor did lab tests and uncovered the lead in the blood of little kids that the administration kicked into high gear, allocating $10 million for water filters, human testing and checking the water in all the schools.

The governor has also formed a task force to review what happened and, while the report is not finalized, there is every indication to believe mistakes were made.

The governor was given a chance on statewide Public TV the other day to apologize to the Flint community for making those mistakes.

Here's what he could have said. All the facts are not in yet, but if mistakes were made, and obviously residents should not have been exposed to lead, if mistakes were made, you will have my apology loud and clear. I understand the public health crisis the residents are facing, and be reassured we are doing everything we can to address the problem.

In a town where anxiety is off the charts on the long-term public health impact on children and adults, citizens might have found an ounce of comfort in that.

What the governor did say was this: "I will be happy to take responsibility as appropriate through this process, and the best guidance on that will be based on that report."

He was also asked if he was sorry this happened, and he said, "Well, yeah."

One of the most telling moments in this saga was when General Motors disconnected from the Flint River because the water was ruining its machinery, leaving some to wonder — if it was doing that to machines, what was it doing to humans?

Critics contend that red flag alone should have motivated the administration to redouble its due diligence to get to the bottom of this.

Another debating point involved the emergency manager, appointed by the governor, who participated in the water switch decision.

The critics contend the EM was more interested in saving money, and because the Flint water was less expensive, he shut off the Detroit pipeline.

The governor believes there were a host of others who participated in all this and he contends, "I think they factored in other things, but let the report speak for itself."

Needless to say, when the report speaks it will make news, news that may not make the governor's day.

All Stories

FLINT, MI – Michigan Gov. Rick Snyder told a Northern Michigan news station that Flint's water problem is his office's "greatest challenge."

During a recent interview with 9&10 News, Snyder said 2015 was a good year for Michigan but troubles with the Vehicle City's water supply show there are still challenges facing the state.

"The greatest challenge we face was Flint with their water situation," Snyder said during the interview. "We've tried to be very proactive in terms of offering free water testing, free water filters, blood testing, follow-up on medical care, changing over water sources. You always want to improve so I always look at ways for continuous improvement."

The problems began after the city stopped receiving treated drinking water from Detroit and began treating water from the Flint River on its own. The change happened while the city was being run by a state-appointed emergency manager.

State and federal reviews of how the Flint's water crisis was allowed to happen are still ongoing, but Snyder's office has faced criticism of its handling of the situation.

State officials found evidence of rising blood lead levels in Flint two months before the problem was exposed by a Flint pediatrician, but didn't immediately inform the public, according to documents recently released by a water researcher.

Michigan public health officials said Dec. 22 that they did not sound an alarm about the spike, which coincided with the city's switch from Detroit to the Flint River for drinking water, because they initially believed the numbers represented a "seasonal fluctuation."

MSNBC political pundit Rachel Maddow has been especially critical of Snyder during multiple recent segments on the city's water issues. Democratic elected officials such as U.S. Rep Dan Kildee and Sen. Debbie Stabenow have called recently for an increased response from the state.

You can see 9&10 News' entire segment with Snyder here.

State's handling of Flint water samples delayed action

Paul Egan, Detroit Free Press 10:09 a.m. EST December 24, 2015

LANSING — Lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the Michigan Department of Environmental Quality to wrongly indicate the water was safe to drink, e-mails show.

The records — obtained by the Michigan ACLU and by Marc Edwards, a Virginia Tech researcher who helped raise concerns about Flint's water — show how state officials first appear to have encouraged the City of Flint to find water samples with low lead levels and later told Flint officials to disqualify two samples with high readings. The move changed the overall lead level results to acceptable from unacceptable.

The e-mails also show that DEQ district coordinator Stephen Busch told the U.S. Environmental

Protection Agency on Feb. 27 that Flint had "an optimized corrosion control program" to prevent lead from leaching into the drinking water from pipes, connections and fixtures. In fact, the city — disastrously — had no corrosion control program.

DETROIT FREE PRESS

When did state know kids in Flint were lead poisoned?

Why those DEQ officials took the actions they did is a question at the center of a tragedy that has left an unknown number of children and other Flint residents poisoned by lead, and has led to a federal lawsuit and calls for a U.S. Justice Department investigation. The questions surrounding the testing are in addition to the broader question of why Flint, which was under the control of a state-appointed emergency manager at the time, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

Brad Wurfel, a spokesman for DEQ Director Dan Wyant, declined to say Tuesday why Busch gave inaccurate information to the EPA, why another DEQ official told Flint officials he was hoping they would send him water samples showing low lead levels, or why the DEQ was strict in disqualifying certain water samples with high lead readings but not strict in disqualifying other samples showing low lead levels that did not appear to meet the sampling criteria.

DETROIT FREE PRESS

Former Flint mayor wants feds to probe lead in water

"Most of these questions regard issues presently before the governor's independent after-action review panel," Wurfel told the Free Press in an e-mail. "We don't want to get in front of that review."

On June 25, Adam Rosenthal, of the DEQ's Office of Drinking Water and Municipal Assistance, sent an e-mail about the water samples, required under the federal Lead and Copper Rule, to Michael Glasgow, a utilities administrator with the City of Flint.

Buy Photo

The Michigan Department of Environmental Quality revised downward the results of water samples in Flint. (Photo: Detroit Free Press file photo)

"Just wanted to remind you/confirm that Flint is on track for a few items," Rosenthal wrote in the e-mail, which he copied to two other DEQ officials.

"We hope you have 61 more lead/copper samples collected and sent to the lab by 6/30/15, and that they are will be (sic) below the AL (action level) for lead," the e-mail said. "As of now with 39 results, Flint's 90th percentile is over the AL for lead."

-

DETROIT FREE PRESS

Flint mayor declares state of emergency over water

If 100 lead-in-water samples were listed in ascending order, the 90th percentile would be the 90th sample, meaning 10 samples would have higher readings. To stay below the "action level," which triggers requirements for public notification and steps to reduce the amount of lead in the water, the 90th percentile for Flint's drinking water samples had to be at or below 15 parts per billion. To put it another way, Flint's water would reach an action level if more than 10% of the samples exceed 15 parts per billion.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said there is only one way to read the Rosenthal e-mail.

"The MDEQ informed the City of Flint that they were in danger of going in violation, and they asked for low samples," Mays told the Free Press.

Wurfel wouldn't comment when asked if that's how the e-mail should be interpreted. Rosenthal did not respond to an e-mail seeking comment. Busch, who was copied on the e-mail Rosenthal sent to Flint, sent an automated e-mail reply that said he is out of the office until Jan. 4.

Had Flint's water sampling come in above the action level, it would have triggered action in July. Instead, it was not until October, after blood test results showed elevated lead levels in Flint children, that the DEQ admitted making a mistake about failing to require the addition of needed corrosion control chemicals to the Flint River water. The state also provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

The EPA requires that water sampling be done at "high-risk" locations whenever possible. To comply with that, the American Water Works Association says cities such as Flint should collect 50% of samples from homes with lead service lines. For the samples taken in 2015, the EPA rules also required that Flint sample the same 100 homes it sampled the previous year, between July and December of 2014.

But the City of Flint didn't get 100 samples in 2015. After receiving Rosenthal's e-mail expressing a hope for samples below the action level, the city in the next five days collected 30 additional samples, all of which were below the action level.

The DEQ decided that fewer than 100 samples would suffice because Flint's population had dropped below 100,000.

But Edwards said the smaller number of samples the DEQ allowed still should have come from the group of 100 homes tested a year earlier and should have all come from homes at high risk for lead.

The Michigan ACLU, and later the Flint Journal has reported that seven of the additional samples the city collected, or nearly 25% of them, came from a single stretch of Flushing Road in Flint, where the city had replaced a lengthy session of water main in 2007. Not surprisingly, all of those samples measured very low for lead.

In all, the newspaper reported, only 13 of the homes sampled were from the same list of 100 homes tested in 2014. All the homes that were sampled for a second time in 2015 had tested low for lead in 2014. None of the homes that in 2014 had lead levels above the 15 parts per billion action level were sampled a second time.

Edwards told the Free Press the samples were "cherry-picked," and that's a violation of federal law.

Wurfel would not comment when asked if that was the case.

Even then, the 71 samples Flint relied on would have put the city's water above the action level under the original report Flint prepared, dated July 28. Only after two high lead samples were disqualified at the direction of the DEQ, bringing the total number of samples used down to 69, was the water found to be at 11 parts per billion for lead, below the action level.

The revised report, dated Aug. 20, included the following comment from Flint utilities administrator Michael Glasgow: "Revised report after conference call with DEQ staff. Two samples were removed from list for not meeting sample criteria ..."

One of the disqualified samples, which showed lead at more than 100 parts per billion, came from the home of LeeAnne Walters. Walters had subsequently been retested with results coming back even worse and was visited by an EPA official in April. That EPA official, Miguel Del Toral, found that Walters' indoor plumbing was plastic and could not be the source of the high lead readings, as the DEQ had suggested to him.

The DEQ disqualified another high lead-level sample because it did not come from a single-family residence.

On Aug. 4, Walters, other community activists, and concerned pastors met at the Capitol with top aides to the governor and officials from the DEQ. Walters asked why her sample wasn't used and didn't get an explanation. She and others at the meeting say Harvey Hollins, an aide to Gov. Rick Snyder who was last week named the state's point man on the Flint water issue, instructed DEQ officials to get back to her on why her sample wasn't used.

Walters says she never received that explanation, but the DEQ produced a letter sent to Walters by e-mail in response to a FOIA request from Edwards.

In the Aug. 25 e-mail, Liane Shekter Smith, who at the time was the chief of the DEQ's Office of Drinking Water and Municipal Assistance but was reassigned in October after the DEQ acknowledged oversight mistakes in connection with Flint's drinking water, tells Walters her results were disqualified because she uses a water filter.

Walters said that she had been instructed to remove the filter before taking any water samples and always did so.

Though it was strict in disqualifying the high samples from Walters, the DEQ did not strictly enforce other requirements related to the samples, such as that they all come from the same group of homes sampled a year earlier, or that they come from homes at high risk for lead.

"The state is the one monitoring these decisions," Walters said. "They should be doing their job accurately. Someone should be holding them accountable for not doing things the way they were supposed to."

•□□□□□□□□ Lee DeVito

The Flint water crisis gets an above the fold, **front page article** in Thursday's edition of the *Detroit Free Press* — though the piece contains no new information on a story that broke more than three months ago.

The article details how the state was slow to acknowledge the problem — that Flint's emergency manager-mandated switch from Detroit's water to the Flint River wound up contaminating the city's supply with lead — by repeatedly downplaying its severity and attempting to discredit the investigations.

Yet it was also the mainstream media that has been slow to acknowledge the crisis.

The story was first reported by Curt Guyette with the ACLU on its **Democracy Watch blog** and here in ***Metro Times***, and first announced by the ACLU at a Sept. 15 press conference in Flint.

Through a unique partnership Guyette and the ACLU have both broken news on the scandal as well as create it (Michigan's ACLU is the only branch in the country to have an investigative reporter on staff). After publishing a leaked EPA memo, Guyette and the ACLU conducted the independent water tests alongside Flint's Coalition for Clean Water and Virginia Tech researchers by going door-to-door and collecting water samples.

"I was really walking a line in my own role as a journalist and activist," Guyette **told *CJR*** last month. "I'm not just observing the story; I'm participating in it. In my mind, I'm just trying to get to the truth."

Earlier this week, **the story was the focus of a segment** of Rachel Maddow's national MSNBC show, who argued the crisis can be traced to Michigan's "radical" emergency manager legislation.

U.S. congressman calls for health fund for children affected by Flint water crisis

Updated: Fri, Dec 25 2015, 08:50 PM

1

FLINT, Mich. (NEWSCHANNEL 3) - A U.S. representative from Michigan is pushing for a health fund for children affected by Flint's water crisis.

Rep. Dan Kildee was on the Rachel Maddow show this week, and he called on Governor Rick Snyder to provide funding for continued health assistance to Flint children diagnosed with elevated levels of lead in their blood.

Kildee says while city officials apologized and acknowledged the failure, "we need them to make it right."

He hasn't given a cost for the program, but says that it includes health, nutritional, and education support for kids under the age of 5.

Auditor general findings set off Flint water debate

Jim Lynch, The Detroit News 3:37 p.m. EST December 28, 2015

Findings compiled by Michigan's Office of the Auditor General have set off another debate about who is to blame for Flint's 18-month-long water crisis.

Two state lawmakers are blaming Flint's contaminated water on state environmental officials based on the auditor general's letter. A state spokesman, however, said the findings of state A uditor General Doug Ringler merely confirm what has already been reported.

The document, a set of answers to detailed questions from Senate Minority Leader Jim Ananich, D-Flint, and Rep. Sheldon Neeley, D-Flint, was released late last week. On Monday, Ananich and Sheldon charged state officials with being behind the 2014 decision to have Flint change the source of its drinking water to the Flint River from the Detroit Water and Sewerage Department's Lake Huron.

"This is another example of how the state failed, initially, and continues to fail, by not treating this situation like the emergency it is," Neeley said in a statement. "We need answers, we need action and we need them sooner rather than later."

In the letter, though, Ringler indicates that when Flint and the Detroit water system officials failed to reach an interim agreement on water supply after Flint decided to build its own water authority, “the City of Flint notified DEQ through a permit request of its intent to operate the Flint WTP (Water Treatment Plant) full time using the Flint River.”

While under the control of an emergency manager appointed by Gov. Rick Snyder, the city began drawing its drinking water from the Flint River in April 2014. The cost-saving move immediately led to complaints from residents about the taste, color and smell of the water coming from their taps.

In July, August and September, testing results began to paint a darker picture — children in certain areas of the city were beginning to show signs of lead contamination.

The city has since switched back to its previous water supplier, the Detroit water department. A task force is charged with figuring out how Flint’s water situation went wrong, including an examination of how corrosion controls were not used in bringing the river water into homes.

Corrosion controls, like phosphates, are added before water leaves the treatment plant to help coat pipelines to prevent lead from leaching in. Following the switch to the Flint River, no such corrosion controls were added. And many of the questions surrounding the problems in Flint center on who decided to omit corrosion controls.

For months, DEQ officials have been under the microscope for their handling of the issue. Some of the harshest criticism has come from those who believe state workers purposely misled the U.S. Environmental Protection Agency over whether corrosion controls were in use.

Critics point to a Feb. 27 email from a state employee to the federal agency contending that a corrosion control program was in place. The Auditor General’s report lays out the resulting situation.

■“It appears the EPA interpreted corrosion control program to mean that corrosion control treatment was in place.”

■“On April 23, 2015, the EPA again inquired as to what the Flint WTP was doing for corrosion control treatment.”

■“DEQ responded on April 24, 2015 that the Flint WTP was not practicing control treatment.”

“Based on our review of this and other emails, we have no specific reason to believe that DEQ willingly misrepresented the information to the EPA,” the report reads.

On Monday, Ananich contended the Auditor General findings put the blame on state officials.

“What’s clear is that corrosion control should have been used, and there are serious failings in our system that must be addressed,” Ananich said in a press release. He added that city officials voted in 2013 to switch to the Karegondi Water Authority — a new regional water supply system that is still under construction — but never addressed the issue of using the Flint River.

State environmental and health officials got a measure of support from the office of Snyder, a Republican.

"The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified," said David Murray, the governor's spokesman.

"But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels. We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues."

On Monday, DEQ Spokesman Brad Wurfel addressed the auditor general's letter.

"The findings of the Auditor General are consistent with our findings at DEQ in our own internal review," Wurfel said. "We appreciate their careful consideration of the issues they were asked to look at."

[illegible]

A swarm of reporters surround Flint Mayor Karen Weaver to ask question after a news conference on Tuesday Dec. 15, 2015 at City Hall in Flint, as Weaver declares a state of emergency in Flint, saying the city needs federal help to deal with its lead in water crisis. "I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told the City Council today, Dec. 14, where she initially made the declaration. "Do we meet the criteria (for a disaster area)? I don't know. I'm going to ask and let them tell us no." The new mayor asked that the Genesee County Board of Commissioners call a special meeting to take action to support her declaration, that it be forwarded to Gov. Rick Snyder, and potentially President Obama. Jake May | MLive.com

All Stories

LANSING, MI -- A letter dated Dec. 23 from the Office of State Auditor General responding to a series of questions asked by Michigan Sen. Jim Ananich, D-Flint, in October made it clear that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water.

Jim Ananich, D-Flint, is Democratic Leader of the Michigan Senate.

Ananich said he asked for the audit to find out how Flint's residents were exposed to lead-tainted water.

"The Auditor General has provided an important piece of this puzzle and I'm sure the extended report they are working on will reveal additional information," Ananich said in a Dec. 28 press release. "What's clear is that corrosion control should have been used and there are serious failings in our system that must be addressed. Between the FOIA emails released recently and these findings, it's obvious that legislative oversight is the best way to see how all of these pieces fit together. I expect holding hearings to be high on the agenda when the Legislature returns."

Ananich's questions included whether corrosion control treatment should have been maintained when the city of Flint switched from Detroit to use the Flint River as its water supply in 2014 and who ultimately showed support for the switch.

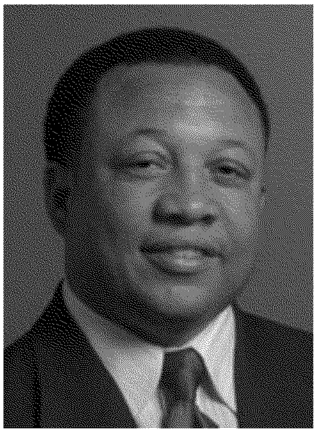
Ananich, along with State Rep. Sheldon Neeley, called for legislative hearings and has asked for a more aggressive response to Flint's water crisis. According to the press release, the two have worked with local and federal officials in securing more resources for safe drinking water for Flint residents.

Gov. Rick Snyder's Press secretary David Murray said the governor's office continues to work on the Flint water issues.

"The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified," Murray said in an email to The Flint Journal.

"But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels," he said. "We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues.

"We appreciate the efforts of the Auditor General and will carefully consider all of the recommendations contained in the letter," Murray said.



State Rep. Sheldon Neeley*MLive.com File*

Neeley says action needs to take place.

"This is another example of how the state failed initially, and continues to fail by not treating this situation like the emergency it is," Neeley said. "We need answers, we need action, and we need them sooner rather than later."

The audit is still ongoing. After the findings, Ananich said, there was a decision to do a more extensive audit. He said after the more-detailed audit is finished, he is hoping to know how this happened to the city of Flint.

"I think it's pretty clear even from this initial report that there needs to be an acknowledgement that the state is responsible in a large part of what happened ... I think there should be accountability and what that looks like we won't know until things move forward. This initial audit shows that we really have an issue that needs to be solved. This helps created a sense of urgency that many of us in Flint have been calling for, for a long time."

The auditors wrote in their report that anti-corrosion measures should have been in place: "We believe that corrosion control treatment should have been maintained." Even so, the DEQ should have told Flint to start corrosion treatment after rising levels of lead were detected in the water, the report says.

Flint Mayor Karen Weaver says an investigation needs to be held on a local level.

"I'm really not surprised by the findings," Weaver said. "But I need to commend Sen. Ananich and State Rep. Neeley for pursing this issue. I would really hope that Flint City Council can do their own investigation and hearings to find out on a local level what happened to make sure this doesn't happen again and to make sure we don't have any gaps."

The report states that the Flint City Council did not vote to switch to Flint River water, as city leaders have claimed. In fact, the report does not clearly indicate who made that decision.

Independent report confirms state made mistakes, but not “intentional” ones in Flint water crisis

By Lindsey Smith · 15 hours ago

Credit Joyce Zhu / Flintwaterstudy.org

Preliminary findings from Michigan's independent Auditor General give more details about the Flint water crisis.

In a letter to State Senator Jim Ananich, Auditor General Doug Ringler answers several key questions about the state's role in the decision to switch to the Flint River and how Michigan's Department of Environmental Quality dealt with those decisions.

Ringler's review confirms it was the state appointed emergency manager who made the decision to switch to the Flint River, not city leaders. It also confirmed that Detroit's water system made offers to keep Flint as a water customer, but that a different emergency manager rejected those offers.

The report says Flint's Water Treatment Plant was upgraded in the 1990s to treat Flint River water as a backup source in case of emergencies. But the city "did not test the water's effect on the distribution system at consumer tap locations."

The distribution system is where the lead in people's tap water came from. Water experts say testing before a major switch is a common and important best practice.

Ringler's review also confirmed that Michigan's Department of Environmental Quality made mistakes when it applied the federal Lead and Copper Rule to the Flint River switch.

MDEQ staffers treated the switch to the river as a new water source, not a new water system. They mistakenly believed that two 6-month testing periods were needed to determine if corrosion control treatment was required.

Assuming the DEQ's flawed method of applying the Lead and Copper Rule, the report notes the DEQ should have notified Flint in March of 2015 that it would need to start corrosion control treatment to keep lead levels in the water lower. But the MDEQ didn't do that until August 2015, after the second testing period was finished.

The review notes MDEQ staff did not ask the federal Environmental Protection Agency how to properly apply the Lead and Copper Rule in the case of Flint's switch to the river. "DEQ believed it had appropriately applied the LCR requirements of a large water system" based on past experience.

Based on the review of federal and state rules, and a clarifying memo from the EPA, Ringler writes, "We believe that corrosion control treatment should have been maintained."

When the EPA first asked the MDEQ if Flint was using corrosion control treatment, state officials said it was. But later, it wrote that Flint was not using such treatment. The A uditor General's investigation shows this was a misunderstanding.

"Based on our review of this and other e-mails, we have no specific reason to believe that MDEQ willfully misrepresented the information to the EPA," Ringler wrote. "We did not note any instances of major infractions (i.e., intentional disregard of policies, laws, regulations or specific directions) committed by DEQ staff during the course of our review."

"What the intent was, whether it was purposeful or not, isn't as important to me as the glaring systematic problems that we've seen," State Senator Jim Ananich said.

Ananich says it's alarming no one within MDEQ seemed to see there was a lead problem, despite numerous red flags. He says the report shows the state bears responsibility to help Flint children who were exposed to lead in drinking water.

MDEQ spokesman Brad Wurfel declined an interview, but said in a written statement that the department agreed with the Auditor General's findings.

"The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues," Wurfel wrote.

The report also found that it was appropriate that the state invalidated two water samples that tested high for lead. The EPA has not commented on this, because it is still conducting its own investigation.

The report also confirmed that the DEQ relied on information from Flint officials to show that all the homes it sampled were the ones it was supposed to; homes with lead distribution pipes.

Flint is still working to figure out exactly where those homes are.

But the auditor notes that Michigan's Department of Environmental Quality could've verified the information Flint provided to make sure the samples and the tests were in compliance with federal rules.

The state didn't ask for that information until last month, long after Flint officials admitted they didn't know where those lead pipes are, and reporters asked why the state hadn't followed up.

BREAKING: DEQ Director Resigns Over Flint Water Crisis

Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.

West Bloomfield, MI

By **BETH DALBEY** (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.

DEQ Director Dan Wyant “has offered his resignation, and I’ve determined that it’s appropriate to accept it,” Snyder said in a statement.

The governor said he will be “making other personnel changes at MDEQ” as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency relief to deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

- State Delayed Action on Lead in Flint Water

The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

- Opioid Addicts Younger Than Ever: Study

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.

The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to the World Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

"I want the Flint community to know how very sorry I am that this has happened. A nd I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure," he wrote.

Changes in leadership and staff aren't enough, Snyder said. The statement continued:

"I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

"Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions," he wrote. "Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.

"These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

Auditor general findings set off Flint water debate

Findings compiled by Michigan's Office of the Auditor General have set off another debate about who is to blame for Flint's 18-month-long water crisis.

Two state lawmakers are blaming Flint's contaminated water on state environmental officials based on the auditor general's letter. A state spokesman, however, said the findings of state A uditor General Doug Ringler merely confirm what has already been reported.

The document, a set of answers to detailed questions from Senate Minority Leader Jim Ananich, D-Flint, and Rep. Sheldon Neeley, D-Flint, was released late last week. On Monday, Ananich and Sheldon charged state officials with being behind the 2014 decision to have Flint change the source of its drinking water to the Flint River from the Detroit Water and Sewerage Department's Lake Huron.

"This is another example of how the state failed, initially, and continues to fail, by not treating this situation like the emergency it is," Neeley said in a statement. "We need answers, we need action and we need them sooner rather than later."

In the letter, though, Ringler indicates that when Flint and the Detroit water system officials failed to reach an interim agreement on water supply after Flint decided to build its own water authority, “the City of Flint notified DEQ through a permit request of its intent to operate the Flint WTP (Water Treatment Plant) full time using the Flint River.”

While under the control of an emergency manager appointed by Gov. Rick Snyder, the city began drawing its drinking water from the Flint River in April 2014. The cost-saving move immediately led to complaints from residents about the taste, color and smell of the water coming from their taps.

In July, August and September, testing results began to paint a darker picture — children in certain areas of the city were beginning to show signs of lead contamination.

The city has since switched back to its previous water supplier, the Detroit water department. A task force is charged with figuring out how Flint’s water situation went wrong, including an examination of how corrosion controls were not used in bringing the river water into homes.

Corrosion controls, like phosphates, are added before water leaves the treatment plant to help coat pipelines to prevent lead from leaching in. Following the switch to the Flint River, no such corrosion controls were added. And many of the questions surrounding the problems in Flint center on who decided to omit corrosion controls.

For months, DEQ officials have been under the microscope for their handling of the issue. Some of the harshest criticism has come from those who believe state workers purposely misled the U.S. Environmental Protection Agency over whether corrosion controls were in use.

Critics point to a Feb. 27 email from a state employee to the federal agency contending that a corrosion control program was in place. The Auditor General’s report lays out the resulting situation.

■“It appears the EPA interpreted corrosion control program to mean that corrosion control treatment was in place.”

■“On April 23, 2015, the EPA again inquired as to what the Flint WTP was doing for corrosion control treatment.”

■“DEQ responded on April 24, 2015 that the Flint WTP was not practicing control treatment.”

“Based on our review of this and other emails, we have no specific reason to believe that DEQ willingly misrepresented the information to the EPA,” the report reads.

On Monday, Ananich contended the Auditor General findings put the blame on state officials.

“What’s clear is that corrosion control should have been used, and there are serious failings in our system that must be addressed,” Ananich said in a press release. He added that city officials voted in 2013 to switch to the Karegondi Water Authority — a new regional water supply system that is still under construction — but never addressed the issue of using the Flint River.

State environmental and health officials got a measure of support from the office of Snyder, a Republican.

“The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified,” said David Murray, the governor’s spokesman.

“But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels. We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues.”

On Monday, DEQ Spokesman Brad Wurfel addressed the auditor general’s letter.

“The findings of the Auditor General are consistent with our findings at DEQ in our own internal review,” Wurfel said. “We appreciate their careful consideration of the issues they were asked to look at.”

[illegible]

A swarm of reporters surround Flint Mayor Karen Weaver to ask question after a news conference on Tuesday Dec. 15, 2015 at City Hall in Flint, as Weaver declares a state of emergency in Flint, saying the city needs federal help to deal with its lead in water crisis. "I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told the City Council today, Dec. 14, where she initially made the declaration. "Do we meet the criteria (for a disaster area)? I don't know. I'm going to ask and let them tell us no." The new mayor asked that the Genesee County Board of Commissioners call a special meeting to take action to support her declaration, that it be forwarded to Gov. Rick Snyder, and potentially President Obama. Jake May | MLive.com

LANSING, MI -- A letter dated Dec. 23 from the Office of State Auditor General responding to a series of questions asked by Michigan Sen. Jim Ananich, D-Flint, in October made it clear that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water.

Jim Ananich, D-Flint, is Democratic Leader of the Michigan Senate.

Ananich said he asked for the audit to find out how Flint's residents were exposed to lead-tainted water.

"The Auditor General has provided an important piece of this puzzle and I'm sure the extended report they are working on will reveal additional information," Ananich said in a Dec. 28 press release. "What's clear is that corrosion control should have been used and there are serious failings in our system that must be addressed. Between the FOIA emails released recently and these findings, it's obvious that legislative oversight is the best way to see how all of these pieces fit together. I expect holding hearings to be high on the agenda when the Legislature returns."

Ananich's questions included whether corrosion control treatment should have been maintained when the city of Flint switched from Detroit to use the Flint River as its water supply in 2014 and who ultimately showed support for the switch.

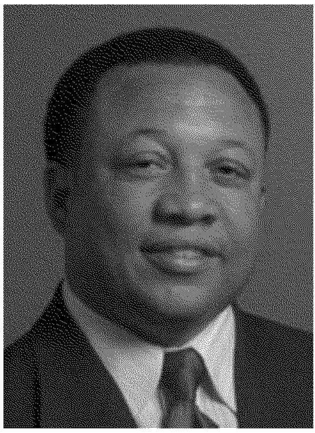
Ananich, along with State Rep. Sheldon Neeley, called for legislative hearings and has asked for a more aggressive response to Flint's water crisis. According to the press release, the two have worked with local and federal officials in securing more resources for safe drinking water for Flint residents.

Gov. Rick Snyder's Press secretary David Murray said the governor's office continues to work on the Flint water issues.

"The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified," Murray said in an email to The Flint Journal.

"But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels," he said. "We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues.

"We appreciate the efforts of the Auditor General and will carefully consider all of the recommendations contained in the letter," Murray said.



State Rep. Sheldon Neeley*MLive.com File*

Neeley says action needs to take place.

"This is another example of how the state failed initially, and continues to fail by not treating this situation like the emergency it is," Neeley said. "We need answers, we need action, and we need them sooner rather than later."

The audit is still ongoing. After the findings, Ananich said, there was a decision to do a more extensive audit. He said after the more-detailed audit is finished, he is hoping to know how this happened to the city of Flint.

"I think it's pretty clear even from this initial report that there needs to be an acknowledgement that the state is responsible in a large part of what happened ... I think there should be accountability and what that looks like we won't know until things move forward. This initial audit shows that we really have an issue that needs to be solved. This helps created a sense of urgency that many of us in Flint have been calling for, for a long time."

The auditors wrote in their report that anti-corrosion measures should have been in place: "We believe that corrosion control treatment should have been maintained." Even so, the DEQ should have told Flint to start corrosion treatment after rising levels of lead were detected in the water, the report says.

Flint Mayor Karen Weaver says an investigation needs to be held on a local level.

"I'm really not surprised by the findings," Weaver said. "But I need to commend Sen. Ananich and State Rep. Neeley for pursing this issue. I would really hope that Flint City Council can do their own investigation and hearings to find out on a local level what happened to make sure this doesn't happen again and to make sure we don't have any gaps."

The report states that the Flint City Council did not vote to switch to Flint River water, as city leaders have claimed. In fact, the report does not clearly indicate who made that decision.

Independent report confirms state made mistakes, but not "intentional" ones in Flint water crisis

By Lindsey Smith · 15 hours ago

Credit Joyce Zhu / Flintwaterstudy.org

Preliminary findings from Michigan's independent Auditor General give more details about the Flint water crisis.

In a letter to State Senator Jim Ananich, Auditor General Doug Ringler answers several key questions about the state's role in the decision to switch to the Flint River and how Michigan's Department of Environmental Quality dealt with those decisions.

Ringler's review confirms it was the state appointed emergency manager who made the decision to switch to the Flint River, not city leaders. It also confirmed that Detroit's water system made offers to keep Flint as a water customer, but that a different emergency manager rejected those offers.

The report says Flint's Water Treatment Plant was upgraded in the 1990s to treat Flint River water as a backup source in case of emergencies. But the city "did not test the water's effect on the distribution system at consumer tap locations."

The distribution system is where the lead in people's tap water came from. Water experts say testing before a major switch is a common and important best practice.

Ringler's review also confirmed that Michigan's Department of Environmental Quality made mistakes when it applied the federal Lead and Copper Rule to the Flint River switch.

MDEQ staffers treated the switch to the river as a new water source, not a new water system. They mistakenly believed that two 6-month testing periods were needed to determine if corrosion control treatment was required.

Assuming the DEQ's flawed method of applying the Lead and Copper Rule, the report notes the DEQ should have notified Flint in March of 2015 that it would need to start corrosion control treatment to keep lead levels in the water lower. But the MDEQ didn't do that until August 2015, after the second testing period was finished.

The review notes MDEQ staff did not ask the federal Environmental Protection Agency how to properly apply the Lead and Copper Rule in the case of Flint's switch to the river. "DEQ believed it had appropriately applied the LCR requirements of a large water system" based on past experience.

Based on the review of federal and state rules, and a clarifying memo from the EPA, Ringler writes, "We believe that corrosion control treatment should have been maintained."

When the EPA first asked the MDEQ if Flint was using corrosion control treatment, state officials said it was. But later, it wrote that Flint was not using such treatment. The A uditor General's investigation shows this was a misunderstanding.

"Based on our review of this and other e-mails, we have no specific reason to believe that MDEQ willfully misrepresented the information to the EPA," Ringler wrote. "We did not note any instances of major infractions (i.e., intentional disregard of policies, laws, regulations or specific directions) committed by DEQ staff during the course of our review."

"What the intent was, whether it was purposeful or not, isn't as important to me as the glaring systematic problems that we've seen," State Senator Jim Ananich said.

Ananich says it's alarming no one within MDEQ seemed to see there was a lead problem, despite numerous red flags. He says the report shows the state bears responsibility to help Flint children who were exposed to lead in drinking water.

MDEQ spokesman Brad Wurfel declined an interview, but said in a written statement that the department agreed with the Auditor General's findings.

"The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues," Wurfel wrote.

The report also found that it was appropriate that the state invalidated two water samples that tested high for lead. The EPA has not commented on this, because it is still conducting its own investigation.

The report also confirmed that the DEQ relied on information from Flint officials to show that all the homes it sampled were the ones it was supposed to; homes with lead distribution pipes.

Flint is still working to figure out exactly where those homes are.

But the auditor notes that Michigan's Department of Environmental Quality could've verified the information Flint provided to make sure the samples and the tests were in compliance with federal rules.

The state didn't ask for that information until last month, long after Flint officials admitted they didn't know where those lead pipes are, and reporters asked why the state hadn't followed up.

BREAKING: DEQ Director Resigns Over Flint Water Crisis

Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.

West Bloomfield, MI

By **BETH DALBEY** (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.

DEQ Director Dan Wyant "has offered his resignation, and I've determined that it's appropriate to accept it," Snyder said in a statement.

The governor said he will be "making other personnel changes at MDEQ" as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency relief to deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

Auditor general findings set off Flint water debate

Jim Lynch, The Detroit News 3:37 p.m. EST December 28, 2015

Findings compiled by Michigan's Office of the Auditor General have set off another debate about who is to blame for Flint's 18-month-long water crisis.

Two state lawmakers are blaming Flint's contaminated water on state environmental officials based on the auditor general's letter. A state spokesman, however, said the findings of state A uditor General Doug Ringler merely confirm what has already been reported.

The document, a set of answers to detailed questions from Senate Minority Leader Jim Ananich, D-Flint, and Rep. Sheldon Neeley, D-Flint, was released late last week. On Monday, Ananich and Sheldon charged state officials with being behind the 2014 decision to have Flint change the source of its drinking water to the Flint River from the Detroit Water and Sewerage Department's Lake Huron.

"This is another example of how the state failed, initially, and continues to fail, by not treating this situation like the emergency it is," Neeley said in a statement. "We need answers, we need action and we need them sooner rather than later."

In the letter, though, Ringler indicates that when Flint and the Detroit water system officials failed to reach an interim agreement on water supply after Flint decided to build its own water authority, "the City of Flint notified DEQ through a permit request of its intent to operate the Flint WTP (Water Treatment Plant) full time using the Flint River."

While under the control of an emergency manager appointed by Gov. Rick Snyder, the city began drawing its drinking water from the Flint River in April 2014. The cost-saving move immediately led to complaints from residents about the taste, color and smell of the water coming from their taps.

In July, August and September, testing results began to paint a darker picture — children in certain areas of the city were beginning to show signs of lead contamination.

The city has since switched back to its previous water supplier, the Detroit water department. A task force is charged with figuring out how Flint's water situation went wrong, including an examination of how corrosion controls were not used in bringing the river water into homes.

Corrosion controls, like phosphates, are added before water leaves the treatment plant to help coat pipelines to prevent lead from leaching in. Following the switch to the Flint River, no such corrosion controls were added. And many of the questions surrounding the problems in Flint center on who decided to omit corrosion controls.

For months, DEQ officials have been under the microscope for their handling of the issue. Some of the harshest criticism has come from those who believe state workers purposely misled the U.S. Environmental Protection Agency over whether corrosion controls were in use.

Critics point to a Feb. 27 email from a state employee to the federal agency contending that a corrosion control program was in place. The Auditor General's report lays out the resulting situation.

■"It appears the EPA interpreted corrosion control program to mean that corrosion control treatment was in place."

■"On April 23, 2015, the EPA again inquired as to what the Flint WTP was doing for corrosion control treatment."

■"DEQ responded on April 24, 2015 that the Flint WTP was not practicing control treatment."

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willingly misrepresented the information to the EPA," the report reads.

On Monday, Ananich contended the Auditor General findings put the blame on state officials.

“What’s clear is that corrosion control should have been used, and there are serious failings in our system that must be addressed,” Ananich said in a press release. He added that city officials voted in 2013 to switch to the Karegondi Water Authority — a new regional water supply system that is still under construction — but never addressed the issue of using the Flint River.

State environmental and health officials got a measure of support from the office of Snyder, a Republican.

“The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified,” said David Murray, the governor’s spokesman.

“But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels. We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues.”

On Monday, DEQ Spokesman Brad Wurfel addressed the auditor general’s letter.

“The findings of the Auditor General are consistent with our findings at DEQ in our own internal review,” Wurfel said. “We appreciate their careful consideration of the issues they were asked to look at.”

Flint officials say they're [illegible]

A swarm of reporters surround Flint Mayor Karen Weaver to ask question after a news conference on Tuesday Dec. 15, 2015 at City Hall in Flint, as Weaver declares a state of emergency in Flint, saying the city needs federal help to deal with its lead in water crisis. "I am requesting that all things be done necessary to address this state of emergency declaration, effective immediately," Weaver told the City Council today, Dec. 14, where she initially made the declaration. "Do we meet the criteria (for a disaster area)? I don't know. I'm going to ask and let them tell us no." The new mayor asked that the Genesee County Board of Commissioners call a special meeting to take action to support her declaration, that it be forwarded to Gov. Rick Snyder, and potentially President Obama. Jake May | MLive.com

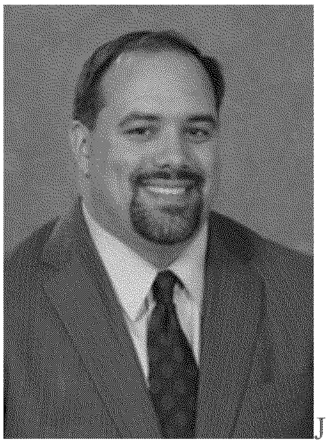
All Stories

LANSING, MI -- A letter dated Dec. 23 from the Office of State Auditor General responding to a series of questions asked by Michigan Sen. Jim Ananich, D-Flint, in October made it clear that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water.



Jim Ananich, D-Flint, is Democratic Leader of the Michigan Senate.

Ananich said he asked for the audit to find out how Flint's residents were exposed to lead-tainted water.

"The Auditor General has provided an important piece of this puzzle and I'm sure the extended report they are working on will reveal additional information," Ananich said in a Dec. 28 press release. "What's clear is that corrosion control should have been used and there are serious failings in our system that must be addressed. Between the FOIA emails released recently and these findings, it's obvious that legislative oversight is the best way to see how all of these pieces fit together. I expect holding hearings to be high on the agenda when the Legislature returns."

Ananich's questions included whether corrosion control treatment should have been maintained when the city of Flint switched from Detroit to use the Flint River as its water supply in 2014 and who ultimately showed support for the switch.

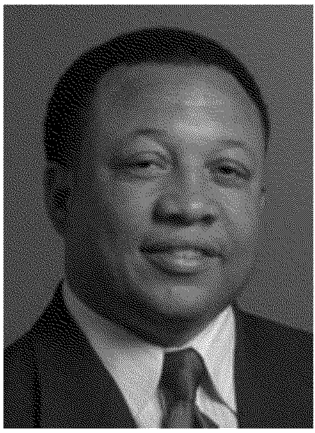
Ananich, along with State Rep. Sheldon Neeley, called for legislative hearings and has asked for a more aggressive response to Flint's water crisis. According to the press release, the two have worked with local and federal officials in securing more resources for safe drinking water for Flint residents.

Gov. Rick Snyder's Press secretary David Murray said the governor's office continues to work on the Flint water issues.

"The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified," Murray said in an email to The Flint Journal.

"But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels," he said. "We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues.

"We appreciate the efforts of the Auditor General and will carefully consider all of the recommendations contained in the letter," Murray said.



State Rep. Sheldon Neeley*MLive.com File*

Neeley says action needs to take place.

"This is another example of how the state failed initially, and continues to fail by not treating this situation like the emergency it is," Neeley said. "We need answers, we need action, and we need them sooner rather than later."

The audit is still ongoing. After the findings, Ananich said, there was a decision to do a more extensive audit. He said after the more-detailed audit is finished, he is hoping to know how this happened to the city of Flint.

"I think it's pretty clear even from this initial report that there needs to be an acknowledgement that the state is responsible in a large part of what happened ... I think there should be accountability and what that looks like we won't know until things move forward. This initial audit shows that we really have an issue that needs to be solved. This helps created a sense of urgency that many of us in Flint have been calling for, for a long time."

The auditors wrote in their report that anti-corrosion measures should have been in place: "We believe that corrosion control treatment should have been maintained." Even so, the DEQ should have told Flint to start corrosion treatment after rising levels of lead were detected in the water, the report says.

Flint Mayor Karen Weaver says an investigation needs to be held on a local level.

"I'm really not surprised by the findings," Weaver said. "But I need to commend Sen. Ananich and State Rep. Neeley for pursing this issue. I would really hope that Flint City Council can do their own investigation and hearings to find out on a local level what happened to make sure this doesn't happen again and to make sure we don't have any gaps."

The report states that the Flint City Council did not vote to switch to Flint River water, as city leaders have claimed. In fact, the report does not clearly indicate who made that decision.

Independent report confirms state made mistakes, but not “intentional” ones in Flint water crisis

By Lindsey Smith · 15 hours ago

Preliminary findings from Michigan's independent Auditor General give more details about the Flint water crisis.

In a letter to State Senator Jim Ananich, Auditor General Doug Ringler answers several key questions about the state's role in the decision to switch to the Flint River and how Michigan's Department of Environmental Quality dealt with those decisions.

Ringler's review confirms it was the state appointed emergency manager who made the decision to switch to the Flint River, not city leaders. It also confirmed that Detroit's water system made offers to keep Flint as a water customer, but that a different emergency manager rejected those offers.

The report says Flint's Water Treatment Plant was upgraded in the 1990s to treat Flint River water as a backup source in case of emergencies. But the city "did not test the water's effect on the distribution system at consumer tap locations."

The distribution system is where the lead in people's tap water came from. Water experts say testing before a major switch is a common and important best practice.

Ringler's review also confirmed that Michigan's Department of Environmental Quality made mistakes when it applied the federal Lead and Copper Rule to the Flint River switch.

MDEQ staffers treated the switch to the river as a new water source, not a new water system. They mistakenly believed that two 6-month testing periods were needed to determine if corrosion control treatment was required.

Assuming the DEQ's flawed method of applying the Lead and Copper Rule, the report notes the DEQ should have notified Flint in March of 2015 that it would need to start corrosion control treatment to keep lead levels in the water lower. But the MDEQ didn't do that until August 2015, after the second testing period was finished.

The review notes MDEQ staff did not ask the federal Environmental Protection Agency how to properly apply the Lead and Copper Rule in the case of Flint's switch to the river. "DEQ believed it had appropriately applied the LCR requirements of a large water system" based on past experience.

Based on the review of federal and state rules, and a clarifying memo from the EPA, Ringler writes, "We believe that corrosion control treatment should have been maintained."

When the EPA first asked the MDEQ if Flint was using corrosion control treatment, state officials said it was. But later, it wrote that Flint was not using such treatment. The A uditor General's investigation shows this was a misunderstanding.

"Based on our review of this and other e-mails, we have no specific reason to believe that MDEQ willfully misrepresented the information to the EPA," Ringler wrote. "We did not note any instances of major infractions (i.e., intentional disregard of policies, laws, regulations or specific directions) committed by DEQ staff during the course of our review."

"What the intent was, whether it was purposeful or not, isn't as important to me as the glaring systematic problems that we've seen," State Senator Jim Ananich said.

Ananich says it's alarming no one within MDEQ seemed to see there was a lead problem, despite numerous red flags. He says the report shows the state bears responsibility to help Flint children who were exposed to lead in drinking water.

MDEQ spokesman Brad Wurfel declined an interview, but said in a written statement that the department agreed with the Auditor General's findings.

"The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues," Wurfel wrote.

The report also found that it was appropriate that the state invalidated two water samples that tested high for lead. The EPA has not commented on this, because it is still conducting its own investigation.

The report also confirmed that the DEQ relied on information from Flint officials to show that all the homes it sampled were the ones it was supposed to; homes with lead distribution pipes.

Flint is still working to figure out exactly where those homes are.

But the auditor notes that Michigan's Department of Environmental Quality could've verified the information Flint provided to make sure the samples and the tests were in compliance with federal rules.

The state didn't ask for that information until last month, long after Flint officials admitted they didn't know where those lead pipes are, and reporters asked why the state hadn't followed up.

LANSING — Gov. Rick Snyder apologized to the City of Flint on Tuesday for the drinking water crisis that has left children poisoned by lead and announced that he accepted the resignation of Michigan Department of Environmental Quality Director Dan Wyant.

Snyder said in a news release that there will be other personnel changes at the DEQ and that the moves he announced are among "initial steps" he is taking to assure the safety of Flint residents, with more action to come.

“I want the Flint community to know how very sorry I am that this has happened," Snyder said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The governor, who previously stood by his DEQ director amid the controversy, said, "Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it."

Before joining the Snyder administration as DEQ director, Wyant was president and chief operating officer of the Edward Lowe Foundation, which promotes entrepreneurship and helps business owners grow their companies. Before that, he served as director of the Michigan Department of Agriculture under Govs. John Engler and Jennifer Granholm.

Brad Wurfel, the DEQ public information officer who apologized after criticizing a researcher's reports of rising lead levels in the blood of Flint children as irresponsible, also resigned Tuesday, a spokesman for Snyder confirmed.

The governor said he acted based on interim findings of the Flint Water Advisory Task Force, which he appointed Oct. 21 to investigate the crisis and is continuing its work. He received a letter Tuesday morning that was highly critical of the DEQ.

The letter from the task force said the "primary responsibility" for what happened in Flint lies with the DEQ; the agency "failed in its responsibility" to ensure safe drinking water for Michigan residents and "must be held accountable for that failure." It was signed by task force members Matt Davis, Chris Kolb, Larry Reynolds, Eric Rothstein and Ken Sikkema.

The Free Press reported Thursday that records obtained by the Michigan ACLU and Virginia Tech researcher Marc Edwards show that elevated lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the DEQ to wrongly indicate the water was safe to drink.

Auditor General Doug Ringler said in a letter released Monday that it was appropriate for the DEQ to disqualify two samples with high lead levels that did not meet the sampling criteria. But the records obtained by the ACLU and Edwards also show that a DEQ official sent Flint an e-mail saying that samples as of late June showed Flint's water had lead levels above the "action level" that would require public notice and remedial action, and he hoped the city could send the remaining required samples quickly and that they would be below the action level for lead.

The records also suggest the DEQ was not as strict in disqualifying samples with low lead levels that did not meet the testing criteria as it was in disqualifying samples with high lead readings.

'It's ... not enough'

Flint, which was under the control of a state-appointed emergency manager at the time of the cost-cutting move, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

The state has acknowledged that it misinterpreted a federal rule and failed to require Flint to add needed corrosion-control chemicals that would have prevented lead from leaching into the drinking water from pipes, connections and fixtures.

That change in the drinking-water source brought immediate complaints from Flint residents about the taste, smell and appearance of the water. The lead tests of the water could have spurred action in July, but it was not until October — after blood test results analyzed by Hurley Children's Hospital pediatrician Dr. Mona Hanna-Attisha showed elevated lead levels in Flint children — that the DEQ admitted making a mistake by failing to require the addition of corrosion-control chemicals to the Flint River water. The state also then provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

Lead can cause irreversible brain damage in children and has also been linked to behavioral problems.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said she was more shocked by Snyder's apology than by Wyant's resignation.

She welcomed the announcements but said more DEQ officials need to be removed because Flint residents can't trust those officials to make sure their water is safe to drink today.

"This all should have happened a long time ago, and it's also not enough," she said.

Mays questioned why Snyder has not endorsed Flint Mayor Karen Weaver's declaration of a state of emergency in Flint, which she said would help secure federal funding to help rectify problems.

Snyder spokesman Dave Murray said "no formal request has been made to the state" to declare a state of emergency in Flint.

"We are committed to working with Mayor Weaver and Genesee County leaders," and the emergency management division of the Michigan State Police is working with city and county officials on potential avenues for federal aid, Murray said.

The crisis has prompted a federal class-action and calls for an investigation by the U.S. Department of Justice.

Goals: Openness, trust

Snyder said "changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water."

Snyder said he wants to "share research on water and blood-lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

The other personnel changes at DEQ referenced by Snyder, aside from Wurfel's resignation, have not yet been made, Murray said.

“I know many Flint citizens are angry and want more than an apology," Snyder said. "That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

The letter from the task force said a minimalist culture of "technical compliance" had developed in the DEQ's Office of Drinking Water and Municipal Assistance and "it led to MDEQ's failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

The office "must adopt a posture that is driven not by this minimalist technical compliance approach, but rather by one that is founded on what needs to be done to assure drinking water safety," the letter said.

The letter also said that both the tone and substance of DEQ statements to the public during the crisis were "completely unacceptable," marked by a "persistent tone of scorn and derision."

Task force members met with Wyant, and while he agreed with many of the task force's interim conclusions, "it was disappointing to hear his weak defense of the (corrosion control) decision," the letter said.

Senate Minority Leader Jim Ananich, D-Flint, said the personnel changes Snyder announced could be a sign of progress if they "lead to a more aggressive response and resources to improve public health."

"I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again," Ananich said in a news release.

"Dan Wyant gets to walk away from this crisis, but the people of Flint do not," said Lonnie Scott, the group's executive director. "There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable."

Michigan's top environmental official resigned Tuesday after an independent task force delivered its initial findings on the Flint water contamination crisis — conclusions that also prompted an apology from Gov. Rick Snyder.

Dan Wyant, director of the Department of Environmental Quality since 2011, tendered his resignation Tuesday, marking the second agency shakeup in just over two months related to Flint's lead-tainted drinking water problems. The industrial city has been plagued by lead issues since an April 2014 switch to the Flint River as its water source.

A Snyder-appointed task force investigating the long-running situation announced it found Tuesday the DEQ "primarily responsible for failing to ensure safe drinking water in Flint." Snyder accepted the initial findings and Wyant's resignation — "I've determined that it's appropriate to accept it, he said — and then issued an apology.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a press release. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

A Flint Water Advisory Task Force co-chair blamed the DEQ's passive culture for Flint's water ills.

“Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance that is simply insufficient to the task of public protection,” wrote Ken Sikkema, a former state senator. “We also believe that the dismissive and disrespectful tone of much of the MDEQ’s response to public concerns is unacceptable.”

The water switch, made while Flint was under the leadership of a Snyder-appointed emergency manager, immediately led to resident complaints about the smell, taste and discoloration of their drinking water. Eventually, researchers found a link between the switch and a rise in lead poisoning among city children.

Lead poisoning can cause learning disabilities and, at high levels, may lead to seizures, coma and death, according to the Centers for Disease Control and Prevention.

Wyant could not be reached for comment Tuesday. In October, Wyant admitted the DEQ erred in its application of the federal Lead and Copper Rule, designed to ensure safe drinking water for residents.

Late on Tuesday, DEQ spokesman Brad Wurfel resigned as well.

Flint was allowed to begin drawing its drinking water from the river without any corrosion controls in place to prevent lead in old plumbing connections from leaching. The task force said the DEQ failed in the regulatory handling of Flint’s water problems, the “substance and tone” in the department’s response as well as its “interpretation of the Lead and Copper Rule.”

State Sen. Jim Ananich, D-Flint, criticized the DEQ culture Tuesday, saying workers were more concerned with following rules than informing the public about potential problems.

“When you have lead in the water, I don’t care if you follow the rules or not: You need to notify the public first,” Ananich said.

Critics have put increasing pressure on Snyder’s administration to answer for the Flint water decisions in the last two years. Among the harshest critics is Marc Edwards, a Virginia Tech researcher whose water sampling at Flint homes and public record requests have helped keep the spotlight on the state government’s actions.

But Edwards said Wyant should not be the one on the chopping block.

“I’m glad that someone is sorry and someone is being held accountable,” Edwards said. “But Dan Wyant would not be at the top of my list — or even on the list. I feel strongly he was misled by his staff at every point, and he was put in publicly embarrassing situations by the staff’s misinformation.”

Dr. Mona Hanna-Attisha, a Hurley Medical Center pediatrician who uncovered lead exposure in city children following the switch, echoed Edwards by saying DEQ staffers’ mistakes led to Flint’s problems.

“(Wyant) wasn’t directly involved,” she said. “There are other people, particularly in (the Office of Drinking Water and Municipal Assistance), that need to take some responsibility. ... (Wyant) was a nice person being fed bad information.”

In 2013, Flint agreed to create a new regional water authority in an attempt to save money. The city had tried to negotiate lower rates with former provider Detroit Water and Sewerage Department for years, to little avail.

But the Karegondi Water Authority will not be completed until some time next year. In the interim, Flint looked to its river to provide drinking water. That water turned out to be far more corrosive than the Lake Huron water used by the Detroit system.

With pressure mounting from troublesome water samples and health studies, Flint reconnected to the Detroit system in October.

Snyder previously was elusive in acknowledging the extent of the state's responsibility for the lead contamination of the city's water when it switched to the more corrosive Flint River in 2014, saying he was awaiting the task force report. On Tuesday, the governor was more contrite.

"We've already allocated $10 million to test the water, distribute water filters, and help in other ways," Snyder said. "Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Michigan Regulator Resigns Amid Flint's Lead-in-Water Crisis (AP)

By DAVID EGGERT, ASSOCIATED PRESS
LANSING, Mich. — Dec 29, 2015, 7:16 PM ET
http://abcnews.go.com/Politics/wireStory/michigan-official-resigns-amid-flint-water-issue-35996502

Michigan's top environmental regulator resigned Tuesday after elevated levels of lead were found in Flint children during a drinking water crisis that a task force blamed primarily on his agency.

Gov. Rick Snyder accepted the resignation of Department of Environmental Quality Director Dan Wyant and apologized for what occurred in Flint, which switched its drinking water supply in a cost-cutting move while under state financial management. Communications director Brad Wurfel also resigned, and Snyder said he plans additional personnel changes in the agency.

Wyant quit the same day a task force appointed by the Republican governor reported that the department was primarily responsible for the fiasco because it did not require Flint to keep corrosive water from leaching lead from service pipes into residents' homes and belittled concerns from the public. Exposure to lead can cause behavior problems and learning disabilities in children.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a written statement. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The five-member task force, which previously brought up concerns about a lack of organization in responding to the disaster, said the environmental department's Office of Drinking Water and Municipal Assistance has a "minimalist approach" to regulatory oversight in which "technical compliance" is sufficient. It faulted the agency for a "tone of scorn and derision" toward the public, including outside water and health experts who raised alarm bells.

The task force confirmed that the state did not follow the federal Lead and Copper Rule when Flint disconnected from Detroit's water system in April 2014 and switched to Flint River water while waiting to connect to a new regional water authority.

Detroit's water from Lake Huron had been treated for corrosion. State officials thought that after Flint made the transition to the river it could test the new water for lead over two six-month intervals to determine potential corrosion treatment instead of needing to immediately add corrosion controls. Flint returned to Detroit's water in October after a public health emergency was declared.

The task force, which met with Wyant on Dec. 16, noted his substantial agreement with many of its conclusions but expressed disappointment with his "weak defense" regarding the federal rule.

The U.S. Environmental Protection Agency said in a November memo that there are "differing possible interpretations" of the Lead and Copper Rule, explaining that it does not explicitly discuss a scenario like in Flint.

But task force members said, "Individuals and agencies responsible must be held accountable in a timely fashion."

They also cited recent revelations of the Department of Health and Human Services' apparent early knowledge of and silence about elevated blood-lead levels, and said the committee's final report in early 2016 would review local governments' decision processes while under emergency management.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust," Snyder said.

Wyant, 56, led the Environmental Quality Department for nearly five years. He previously served as the state's agricultural director under Republican Gov. John Engler and Democratic Gov. Jennifer Granholm.

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress," said Senate Minority Leader Jim Ananich, a Democrat from Flint.

Task force lays most blame for Flint water crisis on MDEQ (Michigan Radio)

By VINCENT DUFFY • 14 HOURS AGO

http://michiganradio.org/post/task-force-lays-most-blame-flint-water-crisis-mdeq#stream/0

MDEQ Director Dan Wyant at a recent press conference.

CREDIT SCREEN GRAB / MLIVE USTREAM

A task force appointed by Gov. Rick Snyder says Michigan's environmental regulatory agency is primarily responsible for the state's failure to ensure safe drinking water for Flint residents.

The Flint Water Advisory Task Force says in a letter to Snyder that the state Department of Environmental Quality "must be held accountable for that failure."

The letter was made public Tuesday. You can read it here.

Corrosive Flint River water leached lead from service pipes into homes after the city switched last year from Detroit water. Elevated blood-lead levels later were found in some children.

Department of Environmental Quality Director Dan Wyant and spokesman Brad Wurfel both resigned Tuesday.

Task force co-chair Ken Sikkema says in the letter that "Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance."

The FWATF letter stated in part:

“We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ). Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure.”

“The City of Flint’s water customers—fellow Michigan citizens—were needlessly and tragically exposed to toxic levels of lead through their drinking water supply. They deserve a commitment to properly assess responsibility and ensure accountability. They also deserve a commitment to needed mitigation in both the short and long term. The Flint water crisis never should have happened. Having failed to prevent it, state government should coordinate a sustained, public-health-focused response to remedy, to the fullest extent possible, the impacts on the Flint community.”

The letter outlined three areas where MDEQ failed:

Regulatory Failure
Failure in Substance and Tone of MDEQ Response to the Public
Failure in MDEQ Interpretation of the Lead and Copper Rule
This is the second letter sent by the Task Force. The first, sent earlier this month, made several recommendations concerning coordination of state efforts that were supported and implemented by Governor Snyder.

The full FWATF report is expected to be completed in early 2016.

Members of the Task Force include:

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan.

Chris Kolb is president of the Michigan Environmental Council.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children’s Health Center.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority.

Ken Sikkema is a senior policy fellow at Public Sector Consultants. (Full Disclosure - he is also a regular commenter on Michigan Radio.)

The FWATF was formed by Governor Snyder to review actions regarding the Flint water system and offer recommendations both for Flint and Michigan to protect the health and safety of state residents.

Flint water scandal: Snyder apologizes, DEQ director resigns (Fox 2 Detroit)

Gov. Rick Snyder announced changes at the Michigan DEQ.
http://www.fox2detroit.com/news/local-news/66000998-story

POSTED:DEC 29 2015 10:25PM EST
UPDATED:DEC 29 2015 11:24PM EST
FLINT, Mich. - Gov. Rick Snyder says he's sorry for Flint's water crisis as one of his top appointees resigns.
The director of the state's department of environmental quality Dan Wyant resigned.

Wyant was in charge of keeping the water safe. When Flint switched its drinking water source from Lake Huron water supplied by detroit...to the flint river - to save money -- corrosion flowed through the pipes.

Score Big & Save on VIZIO Ultra HDTVsVizio
Tests showed elevated levels of lead in the city's drinking water back in June. But the state didn't take action until October after blood testing showed high lead levels in Flint's children.
Flint water scandal: Snyder apologizes, DEQ director resigns
Snyder's office issued a press release Tuesday:
"I want the Flint community to know how very sorry I am that this has happened," he said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.
"When I became aware that the city of Flint's water showed elevated lead levels and that the state's handling of the situation was being questioned," he said. "I requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible missteps and areas for improvement.
"The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials … We'll continue to work with the community members to make sure we hear and respond to their concerns.
"MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force."
In a previous FOX 2 report it was discovered a year after the city began using the Flint

River as its water source; a local hospital's study found the number of Flint kids under the age of 5 years old with above average lead levels nearly doubled city-wide and in some cases, tripled.

Virginia Tech University tested resident Ronda Thornton's water. Anything more than 30 micrograms a liter is a sign of serious lead contamination. Hers registered 138.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

"But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

FLINT, MI – Mayor Karen Weaver and other local leaders say the resignation of Michigan Department of Environmental Quality Director Dan Wyant and release of Flint Water Task Force findings Tuesday are the first steps toward holding people accountable for Flint's water crisis.

"There is some accountability being put in place and that's a good thing," Weaver said. "That's what is happening and I think that's a good sign because it shows that our voices have been heard and that they will continue to be heard."

According to a statement issued by Gov. Rick Snyder on Dec. 29, he has accepted Wyant's resignation after findings from a report by the task force, which was created by Snyder in October to look into Flint's water crisis. In the same statement, Snyder also said he was "sorry" to the Flint community for the water issues.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust ...

Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Weaver confirmed that she will be meeting with Snyder after the first of the year.

"I hope this will help move Flint forward," she said. "One thing that has been an issue for us here in Flint has been that broken trust. We will have a new person that we will be working with, and that's a positive step."

The task force report, which is preliminary, revealed that the MDEQ failed the city in multiple areas including regulatory failures, substance and tone of the MDEQ's response to public and the interpretation of the federal lead and copper rule.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," said the preliminary report. "Although many individuals and entities at state and local levels contributed to creating a prolonging problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable."

State Rep. Sheldon Neeley, D-Flint, said that he and others in the city have called for legislative hearings regarding the water crisis and that Wyant's departure is just the first, not the only, person held responsible for the condition of Flint's water.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or have Gov. Rick Snyder do the deed for him," Neeley said in a statement issued Dec. 29. "There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders."

Neeley, who along with Sen. Jim Ananich, D-Flint, have been pushing for legislative hearings on Flint's water crisis, went on to say there is still "cleanup do be done" and he is "glad" that Wyant has stepped down in what Neeley considers a "disorganized and flawed DEQ."

The task force's report also says members spoke with Wyant on Dec. 16 and they were not pleased with how he responded to the city's water crisis and he was in agreement with some of their findings.

"It is our understanding that he has drawn similar conclusions in his own evaluation of MDEQ's role in the Flint water crisis," said the report. "At the same time, it was disappointing to hear his weak defense of the CCT (corrosion control treatment) decision based on the EPA's November 2015 memorandum."

Both Ananich and Neeley's push led to an independent review by the Office of State Auditor Genera,l which made it clear in a Dec. 23 letter that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water.

The review was based on a series of questions sent to the auditor from Ananich in October.

The corrosiveness of Flint River water is blamed for lead that leached from pipes into drinking water, causing elevated levels of lead in the blood of Flint children.

"I think the best apology (Snyder) can offer the residents of Flint and the rest of the state is a promise that this will never happen again," Ananich said. "The proof is in the long-term commitment. I'm going to continue to work to make sure that we get that."

Michigan Gov. Rick Snyder apologizes for lead levels in Flint water (Detroit 4)

DEQ head Dan Wyant's resigns after task force blames department for crisis

By Jason Colthorp – Reporter
http://www.clickondetroit.com/news/michigan-official-resigns-amid-flint-water-issue_
LANSING, Mich. - Gov. Rick Snyder issued an apology Tuesday as Dan Wyant, his head of the Department of Environmental Quality, resigned after a task force lead by the state's auditor general blasted the DEQ for it's role in Flint's water crisis.

The state's mishandling of Flint's water system ultimately exposed Flint residents to dangerously elevated levels of lead.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a statement. "And I want all Michigan citizens to know that we will learn from this experience."

The governor's apology and the DEQ head's resignation has helped to temper concerns that no one cared about Flint said the city's mayor Karen Weaver.

"One of the things we've always talked about is accountability and that seems to be what's happening," said Weaver. "It also let us know here in Flint that our voice is being heard."

Snyder's apology and Wyant's resignation come after the task force released their finding that the DEQ was primarily at fault for Flint's unhealthy level of lead in their drinking water.

"Although many contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan," the task force said in a written statement. "It failed in that responsibility."

For many Flint residents like Kim Peterson, Tuesday's announcements do little to help them feel confident about the safety of their drinking water. Peterson says she is still hesitant to drink the water even though it is again coming from a healthy source in Lake Huron.

"I take it to mean that something was really wrong with this whole system of checks and balances," she said.

"You don't trust it because you've heard so many conflicting things from so many different people, so we still continue to buy the water."

Mayor Weaver, however, believes Snyder's apology is a first step toward rebuilding trust: "This is a good step to get some things started because people had lost faith and they had lost trust."

Snyder has promised more steps will be taken after the task force releases its final and full report.

By Emily Lawler | elawler@mlive.com
on December 29, 2015 at 4:39 PM, updated December 29, 2015 at 6:51 PM
LANSING, MI -- Gov. Rick Snyder on Tuesday accepted a resignation from Michigan Department of Environmental Quality Director Dan Wyant after a task force laid responsibility for the Flint water crisis at the feet of the department.
Snyder, in a statement, announced Wyant's resignation and apologized to Flint residents after he received a letter from the Flint Water Advisory Task Force.
"...MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force," Snyder said.
Wyant and the DEQ have come under fire in recent months for handling a Flint drinking water crisis that lead to corrosive water running through city pipes and resulted in children with elevated levels of lead. In October, Wyant acknowledgeda mistake in oversight from his office, saying DEQ officials were confused about federal regulations on making the drinking water less corrosive.
The task force in its letter blamed the department for the crisis.
"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," read the letter to Snyder.
"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure."
The task force cited DEQ's involvement as regulatory failure, failure in substance and tone of response to the public and a failure of interpreting the lead and copper rule.
Gov. Rick Snyder recently named the Flint water crisis as his biggest disappointment in 2015.
Wyant had a long track record of service for the state. He served as director of the Michigan Department of Agriculture under both Democratic Gov. Jennifer Granholm and Republican Gov. John Engler before Gov. Rick Snyder tapped him to head up the DEQ in 2011.
He shepherded the department through a transition into being its own entity again after Gov. Jennifer Granholm had combined it with the Department of Natural Resources, forming the Department of Natural Resources and Environment. He also led the "quality of life group" within state government, meaning he coordinated efforts between the DNR, DEQ and Department of Agriculture and Rural Development.
The statement from Snyder alluded to other structural changes within the DEQ, and spokesperson Dave Murray said those decisions would be made in the coming days.
DEQ spokesperson Brad Wurfel did not immediately return a call for comment.

Wyant's resignation met with mixed reaction from political groups and leaders.
Senate Minority Leader Jim Ananich (D-Flint) released the following statement:
"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress. I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again."
Attorney General Bill Schuette praised Wyant's service to the state.
"I am saddened to hear of the resignation of Department of Environment Quality Director Dan Wyant. In my 20-plus years of knowing him, Dan has been a hardworking, dedicated public servant. I am committed to working with all parties, including the legislature and Governor, to ensure the public's health and the well being of Michigan residents."
Democratic Congressman Dan Kildee, who represents Flint, said the steps taken today were appropriate but encouraged further action.
"Governor Snyder's apology over the Flint water crisis is appropriate, as are personnel changes announced today at the Department of Environmental Quality," Kildee said.
"Through this ongoing crisis, the people of Flint did nothing wrong – they are victims of this failure of government. The State of Michigan must not only acknowledge its role in this crisis, but also take responsibility and act right away to make it right."
He urged the state to establish a fund to ensure that kids receive developmental, nutritional and educational resources to help overcome the effects of their lead exposure.
Rep. Sheldon Neeley, D-Flint, said Wyant was not the only offender.
"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or to have Gov. Rick Snyder do the deed for him. There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders," Neeley said.
"While there is still much cleanup to be done, I am glad Mr. Wyant realized he could no longer continue as the head of the disorganized and flawed DEQ, and I call on Gov. Snyder to take careful effort in repairing this department so that it earns back the trust of the people of Flint and this great state.
Progress Michigan said there had been a lack of accountability for the Flint water crisis.
"So far under Gov. Rick Snyder's watch, there has been zero accountability in this crisis and that continues today," said Lonnie Scott, executive director of Progress Michigan.
"Dan Wyant gets to walk away from this criss, but the people of Flint do not. There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable. All documentation related this this crisis needs to be released to the public immediately."

Auditor: State erred on Flint water but didn't mislead feds (AP/Crain's Detroit)
http://www.crainsdetroit.com/article/20151228/NEWS01/151229867/auditor-state-erred-on-flint-water-but-didnt-mislead-feds By David Eggert

Associated Press
Michigan Department of Environmental Quality Environment More +
LANSING — The director of Michigan's Department of Environmental Quality has resigned after the Flint Water Task Force delivered its findings on the the city's water contamination crisis to Gov. Rick Snyder.
Snyder said Tuesday afternoon in a statement that he accepted the resignation of Dan Wyant and plans to make "other personnel changes at MDEQ to address problems cited by the task force.
“But changes in leadership and staff are not enough."
In a preliminary report released Monday, Michigan's auditor general said state regulators should have required Flint to treat its corrosive drinking water to keep lead from leaching from service lines into people's homes but did not purposely mislead federal officials about the lack of corrosion control.
Doug Ringler, citing a memo issued last month by the U.S. Environmental Protection Agency, concluded that the Michigan Department of Environmental Quality erred in not requiring the city to immediately combat corrosion when it switched from Detroit's system to the Flint River in April 2014 in a cost-cutting move while under state financial management. State officials interpreted federal rules to mean Flint could make the transition and then test the new water for lead over two six-month intervals to determine potential corrosion treatment.
Flint children have been found to have elevated levels of lead in their blood since the water change. Gov. Rick Snyder's administration initially downplayed concerns but later committed funding to reconnect Flint to Detroit and to provide filters, testing and other services.
Ringler was already conducting an audit of Michigan's Office of Drinking Water and Municipal Assistance when the Flint corrosion issue arose. At the request of Senate Minority Leader Jim Ananich, he answered questions specific to Flint's lead contamination, including concerns that state regulators misled federal environmental regulators.
In February, a DEQ water supervisor told the EPA that Flint had a corrosion control program in place. But in April, an EPA official confirmed through another DEQ official that the city was not practicing corrosion treatment, according to emails.
The EPA apparently interpreted the word "program" to mean treatment, while the DEQ meant it as testing to determine if corrosion controls would be needed in the future.
"Based on our review of this and other emails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA," Ringler wrote in a letter dated Wednesday and made public Monday.
The auditor concluded, however, that regardless of confusion over the federal rule, the state should have required Flint to start pursuing corrosion treatment in March after the first six months of testing showed too-high lead levels instead of waiting until August after a second six-month period. He also said the DEQ did not verify that Flint was correctly sampling water from houses only with lead pipes or lead service lines. He suggested that the department consider doing so.
"We agreed with the findings in the Auditor General's review," DEQ spokesman Brad Wurfel said. "The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues."
The Republican governor has come under scrutiny for the Flint fiasco. Spokesman Dave

Murray said the letter "includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified. But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels."
Ananich, D-Flint, said "there are serious failings in our system that must be addressed" and again called for GOP leaders to schedule legislative hearings. They have rejected the requests, citing the work of a task force formed by Snyder.
The auditor's letter did not provide clarity on who specifically decided to use the Flint River for water. It was supposed to be an interim source until the city could join a new system getting water from Lake Huron.
Ringler noted that the city council voted in March 2013 to support moving to the Karegnondi Water Authority but was "silent" on using the river temporarily. Flint was being run by a Snyder-appointed manager until this past April and remains under some state oversight.

BREAKING: DEQ Director Resigns Over Flint Water Crisis (West Bloomfield Patch)
Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.
http://patch.com/michigan/westbloomfield/breaking-deq-director-resigns-over-flint-water-crisis
West Bloomfield, MI

By BETH DALBEY (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.
DEQ Director Dan Wyant "has offered his resignation, and I've determined that it's appropriate to accept it," Snyder said in a statement.

The governor said he will be "making other personnel changes at MDEQ" as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency reliefto deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

State Delayed Action on Lead in Flint Water

The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.
The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to theWorld Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

"I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure," he wrote.

Changes in leadership and staff aren't enough, Snyder said. The statement continued:

"I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

"Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions," he wrote. "Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.

"These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

MDEQ Director Wyant resigns over Flint water crisis, Snyder apologizes (Michigan Radio)

UPDATED AT 5:37 PM ON 12/29/15

The head of the Michigan Department of Environmental Quality (MDEQ) has resigned over the drinking water crisis in Flint.

Gov. Rick Snyder has also now apologized to the community of Flint for his administration's involvement in the situation.

"I want the Flint community to know how very sorry I am that this has happened," said Snyder in a statement on Tuesday. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

MDEQ Director Dan Wyant will step down immediately. The resignation comes after Snyder received initial findings from the task force he appointed to investigate the situation. A number of reports have pointed to mistakes the department made that resulted in elevated lead levels in the city's water.

The governor says he plans to make additional personnel changes in the department – although he hasn't announced what those will be. And he says he'll meet with Flint Mayer Karen Weaver to discuss further actions the state could take to help the city.

Also resigning from the MDEQ today was spokesman Brad Wurfel.

Letter says the state department is at fault in Flint Water Crisis (WLNS News 6)

LANSING, MI. (WLNS) – At the state capital, a letter sent to Governor Snyder from his Flint Water Crisis task force says there's a state department to blame for the city's water problems.

In the letter the task force says the Department of Environmental Quality must be held accountable for failing to ensure the safe drinking water for people of Flint.

It says Flint residents were exposed to toxic levels of lead in their water because of a culture of passive compliance.

In addition to the letter, Dan Wyant stepped down as director of the department

LANSING — Gov. Rick Snyder apologized to the City of Flint on Tuesday for the drinking water crisis that has left children poisoned by lead and announced that he accepted the resignation of Michigan Department of Environmental Quality Director Dan Wyant.

Snyder said in a news release that there will be other personnel changes at the DEQ and that the moves he announced are among "initial steps" he is taking to assure the safety of Flint residents, with more action to come.

“I want the Flint community to know how very sorry I am that this has happened," Snyder said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The governor, who previously stood by his DEQ director amid the controversy, said, "Dan Wyant has offered his resignation, and I’ve determined that it’s appropriate to accept it."

Before joining the Snyder administration as DEQ director, Wyant was president and chief operating officer of the Edward Lowe Foundation, which promotes entrepreneurship and helps business owners grow their companies. Before that, he served as director of the Michigan Department of Agriculture under Govs. John Engler and Jennifer Granholm.

Brad Wurfel, the DEQ public information officer who apologized after criticizing a researcher's reports of rising lead levels in the blood of Flint children as irresponsible, also resigned Tuesday, a spokesman for Snyder confirmed.

The governor said he acted based on interim findings of the Flint Water Advisory Task Force, which he appointed Oct. 21 to investigate the crisis and is continuing its work. He received a letter Tuesday morning that was highly critical of the DEQ.

The letter from the task force said the "primary responsibility" for what happened in Flint lies with the DEQ; the agency "failed in its responsibility" to ensure safe drinking water for Michigan residents and "must be held accountable for that failure." It was signed by task force members Matt Davis, Chris Kolb, Larry Reynolds, Eric Rothstein and Ken Sikkema.

The Free Press reported Thursday that records obtained by the Michigan ACLU and Virginia Tech researcher Marc Edwards show that elevated lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the DEQ to wrongly indicate the water was safe to drink.

Auditor General Doug Ringler said in a letter released Monday that it was appropriate for the DEQ to disqualify two samples with high lead levels that did not meet the sampling criteria. But the records obtained by the ACLU and Edwards also show that a DEQ official sent Flint an e-mail saying that samples as of late June showed Flint's water had lead levels above the "action level" that would require public notice and remedial action, and he hoped the city could send the remaining required samples quickly and that they would be below the action level for lead.

The records also suggest the DEQ was not as strict in disqualifying samples with low lead levels that did not meet the testing criteria as it was in disqualifying samples with high lead readings.

'It's ... not enough'

Flint, which was under the control of a state-appointed emergency manager at the time of the cost-cutting move, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

The state has acknowledged that it misinterpreted a federal rule and failed to require Flint to add needed corrosion-control chemicals that would have prevented lead from leaching into the drinking water from pipes, connections and fixtures.

That change in the drinking-water source brought immediate complaints from Flint residents about the taste, smell and appearance of the water. The lead tests of the water could have spurred action in July, but it was not until October — after blood test results analyzed by Hurley Children's Hospital pediatrician Dr. Mona Hanna-Attisha showed elevated lead levels in Flint children — that the DEQ admitted making a mistake by failing to require the addition of corrosion-control chemicals to the Flint River water. The state also then provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

Lead can cause irreversible brain damage in children and has also been linked to behavioral problems.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said she was more shocked by Snyder's apology than by Wyant's resignation. She welcomed the announcements but said more DEQ officials need to be removed because Flint residents can't trust those officials to make sure their water is safe to drink today.

"This all should have happened a long time ago, and it's also not enough," she said.

Mays questioned why Snyder has not endorsed Flint Mayor Karen Weaver's declaration of a state of emergency in Flint, which she said would help secure federal funding to help rectify problems.

Snyder spokesman Dave Murray said "no formal request has been made to the state" to declare a state of emergency in Flint.

"We are committed to working with Mayor Weaver and Genesee County leaders," and the emergency management division of the Michigan State Police is working with city and county officials on potential avenues for federal aid, Murray said.

The crisis has prompted a federal class-action and calls for an investigation by the U.S. Department of Justice.

Goals: Openness, trust

Snyder said "changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water."

Snyder said he wants to "share research on water and blood-lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

The other personnel changes at DEQ referenced by Snyder, aside from Wurfel's resignation, have not yet been made, Murray said.

“I know many Flint citizens are angry and want more than an apology," Snyder said. "That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

The letter from the task force said a minimalist culture of "technical compliance" had developed in the DEQ's Office of Drinking Water and Municipal Assistance and "it led to MDEQ's failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

The office "must adopt a posture that is driven not by this minimalist technical compliance approach, but rather by one that is founded on what needs to be done to assure drinking water safety," the letter said.

The letter also said that both the tone and substance of DEQ statements to the public during the crisis were "completely unacceptable," marked by a "persistent tone of scorn and derision."

Task force members met with Wyant, and while he agreed with many of the task force's interim conclusions, "it was disappointing to hear his weak defense of the (corrosion control) decision," the letter said.

Senate Minority Leader Jim Ananich, D-Flint, said the personnel changes Snyder announced could be a sign of progress if they "lead to a more aggressive response and resources to improve public health."

"I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again," Ananich said in a news release.

"Dan Wyant gets to walk away from this crisis, but the people of Flint do not," said Lonnie Scott, the group's executive director. "There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable."

Michigan’s top environmental official resigned Tuesday after an independent task force delivered its initial findings on the Flint water contamination crisis — conclusions that also prompted an apology from Gov. Rick Snyder.

Dan Wyant, director of the Department of Environmental Quality since 2011, tendered his resignation Tuesday, marking the second agency shakeup in just over two months related to Flint's lead-tainted drinking water problems. The industrial city has been plagued by lead issues since an April 2014 switch to the Flint River as its water source.

A Snyder-appointed task force investigating the long-running situation announced it found Tuesday the DEQ "primarily responsible for failing to ensure safe drinking water in Flint." Snyder accepted the initial findings and Wyant's resignation — "I've determined that it's appropriate to accept it, he said — and then issued an apology.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a press release. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

A Flint Water Advisory Task Force co-chair blamed the DEQ's passive culture for Flint's water ills.

"Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance that is simply insufficient to the task of public protection," wrote Ken Sikkema, a former state senator. "We also believe that the dismissive and disrespectful tone of much of the MDEQ's response to public concerns is unacceptable."

The water switch, made while Flint was under the leadership of a Snyder-appointed emergency manager, immediately led to resident complaints about the smell, taste and discoloration of their drinking water. Eventually, researchers found a link between the switch and a rise in lead poisoning among city children.

Lead poisoning can cause learning disabilities and, at high levels, may lead to seizures, coma and death, according to the Centers for Disease Control and Prevention.

Wyant could not be reached for comment Tuesday. In October, Wyant admitted the DEQ erred in its application of the federal Lead and Copper Rule, designed to ensure safe drinking water for residents.

Late on Tuesday, DEQ spokesman Brad Wurfel resigned as well.

Flint was allowed to begin drawing its drinking water from the river without any corrosion controls in place to prevent lead in old plumbing connections from leaching. The task force said the DEQ failed in the regulatory handling of Flint's water problems, the "substance and tone" in the department's response as well as its "interpretation of the Lead and Copper Rule."

State Sen. Jim Ananich, D-Flint, criticized the DEQ culture Tuesday, saying workers were more concerned with following rules than informing the public about potential problems.

"When you have lead in the water, I don't care if you follow the rules or not: You need to notify the public first," Ananich said.

Critics have put increasing pressure on Snyder's administration to answer for the Flint water decisions in the last two years. Among the harshest critics is Marc Edwards, a Virginia Tech researcher whose water sampling at Flint homes and public record requests have helped keep the spotlight on the state government's actions.

But Edwards said Wyant should not be the one on the chopping block.

"I'm glad that someone is sorry and someone is being held accountable," Edwards said.

“But Dan Wyant would not be at the top of my list — or even on the list. I feel strongly he was misled by his staff at every point, and he was put in publicly embarrassing situations by the staff’s misinformation.”

Dr. Mona Hanna-Attisha, a Hurley Medical Center pediatrician who uncovered lead exposure in city children following the switch, echoed Edwards by saying DEQ staffers’ mistakes led to Flint’s problems.

“(Wyant) wasn’t directly involved,” she said. “There are other people, particularly in (the Office of Drinking Water and Municipal Assistance), that need to take some responsibility. ... (Wyant) was a nice person being fed bad information.”

In 2013, Flint agreed to create a new regional water authority in an attempt to save money. The city had tried to negotiate lower rates with former provider Detroit Water and Sewerage Department for years, to little avail.

But the Karegondi Water Authority will not be completed until some time next year. In the interim, Flint looked to its river to provide drinking water. That water turned out to be far more corrosive than the Lake Huron water used by the Detroit system.

With pressure mounting from troublesome water samples and health studies, Flint reconnected to the Detroit system in October.

Snyder previously was elusive in acknowledging the extent of the state’s responsibility for the lead contamination of the city’s water when it switched to the more corrosive Flint River in 2014, saying he was awaiting the task force report. On Tuesday, the governor was more contrite.

“We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways,” Snyder said. “Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.”

Michigan Regulator Resigns Amid Flint's Lead-in-Water Crisis (AP)
By DAVID EGGERT, ASSOCIATED PRESS
LANSING, Mich. — Dec 29, 2015, 7:16 PM ET
http://abcnews.go.com/Politics/wireStory/michigan-official-resigns-amid-flint-water-issue-35996502

Michigan's top environmental regulator resigned Tuesday after elevated levels of lead were found in Flint children during a drinking water crisis that a task force blamed primarily on his agency.

Gov. Rick Snyder accepted the resignation of Department of Environmental Quality Director Dan Wyant and apologized for what occurred in Flint, which switched its drinking water supply in a cost-cutting move while under state financial management. Communications director Brad Wurfel also resigned, and Snyder said he plans additional personnel changes in the agency.

Wyant quit the same day a task force appointed by the Republican governor reported that the department was primarily responsible for the fiasco because it did not require Flint to keep corrosive water from leaching lead from service pipes into residents' homes and belittled concerns from the public. Exposure to lead can cause behavior problems and learning disabilities in children.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a written statement. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The five-member task force, which previously brought up concerns about a lack of organization in responding to the disaster, said the environmental department's Office of Drinking Water and Municipal Assistance has a "minimalist approach" to regulatory oversight in which "technical compliance" is sufficient. It faulted the agency for a "tone of scorn and derision" toward the public, including outside water and health experts who raised alarm bells.

The task force confirmed that the state did not follow the federal Lead and Copper Rule when Flint disconnected from Detroit's water system in April 2014 and switched to Flint River water while waiting to connect to a new regional water authority.

Detroit's water from Lake Huron had been treated for corrosion. State officials thought that after Flint made the transition to the river it could test the new water for lead over two six-month intervals to determine potential corrosion treatment instead of needing to immediately add corrosion controls. Flint returned to Detroit's water in October after a public health emergency was declared.

The task force, which met with Wyant on Dec. 16, noted his substantial agreement with many of its conclusions but expressed disappointment with his "weak defense" regarding the federal rule.

The U.S. Environmental Protection Agency said in a November memo that there are "differing possible interpretations" of the Lead and Copper Rule, explaining that it does not explicitly discuss a scenario like in Flint.

But task force members said, "Individuals and agencies responsible must be held accountable in a timely fashion."

They also cited recent revelations of the Department of Health and Human Services' apparent early knowledge of and silence about elevated blood-lead levels, and said the committee's final report in early 2016 would review local governments' decision processes while under emergency management.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust," Snyder said.

Wyant, 56, led the Environmental Quality Department for nearly five years. He previously served as the state's agricultural director under Republican Gov. John Engler and Democratic Gov. Jennifer Granholm.

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress," said Senate Minority Leader Jim Ananich, a Democrat from Flint.

Task force lays most blame for Flint water crisis on MDEQ (Michigan Radio)

By VINCENT DUFFY • 14 HOURS AGO
SHARETwitter Facebook Google+ Email
http://michiganradio.org/post/task-force-lays-most-blame-flint-water-crisis-mdeq#stream/0
MDEQ Director Dan Wyant at a recent press conference.
CREDIT SCREEN GRAB / MLIVE USTREAM

A task force appointed by Gov. Rick Snyder says Michigan's environmental regulatory agency is primarily responsible for the state's failure to ensure safe drinking water for Flint residents.

The Flint Water Advisory Task Force says in a letter to Snyder that the state Department of Environmental Quality "must be held accountable for that failure."

The letter was made public Tuesday. You can read it here.

Corrosive Flint River water leached lead from service pipes into homes after the city switched last year from Detroit water. Elevated blood-lead levels later were found in some children.

Department of Environmental Quality Director Dan Wyant and spokesman Brad Wurfel both resigned Tuesday.

Task force co-chair Ken Sikkema says in the letter that "Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance."

The FWATF letter stated in part:

“We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ). Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure.”

“The City of Flint’s water customers—fellow Michigan citizens—were needlessly and tragically exposed to toxic levels of lead through their drinking water supply. They deserve a commitment to properly assess responsibility and ensure accountability. They also deserve a commitment to needed mitigation in both the short and long term. The Flint water crisis never should have happened. Having failed to prevent it, state government should coordinate a sustained, public-health-focused response to remedy, to the fullest extent possible, the impacts on the Flint community.”

The letter outlined three areas where MDEQ failed:

Regulatory Failure
Failure in Substance and Tone of MDEQ Response to the Public
Failure in MDEQ Interpretation of the Lead and Copper Rule
This is the second letter sent by the Task Force. The first, sent earlier this month, made several recommendations concerning coordination of state efforts that were supported and implemented by Governor Snyder.

The full FWATF report is expected to be completed in early 2016.

Members of the Task Force include:

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan.

Chris Kolb is president of the Michigan Environmental Council.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority.

Ken Sikkema is a senior policy fellow at Public Sector Consultants. (Full Disclosure - he is also a regular commenter on Michigan Radio.)

The FWATF was formed by Governor Snyder to review actions regarding the Flint water system and offer recommendations both for Flint and Michigan to protect the health and safety of state residents.

Flint water scandal: Snyder apologizes, DEQ director resigns (Fox 2 Detroit)

Gov. Rick Snyder announced changes at the Michigan DEQ.
http://www.fox2detroit.com/news/local-news/66000998-story

POSTED:DEC 29 2015 10:25PM EST
UPDATED:DEC 29 2015 11:24PM EST
FLINT, Mich. - Gov. Rick Snyder says he's sorry for Flint's water crisis as one of his top appointees resigns.
The director of the state's department of environmental quality Dan Wyant resigned.

Wyant was in charge of keeping the water safe. When Flint switched its drinking water source from Lake Huron water supplied by detroit...to the flint river - to save money -- corrosion flowed through the pipes.

Tests showed elevated levels of lead in the city's drinking water back in June. But the state didn't take action until October after blood testing showed high lead levels in Flint's children.
Flint water scandal: Snyder apologizes, DEQ director resigns
Snyder's office issued a press release Tuesday:

"I want the Flint community to know how very sorry I am that this has happened," he said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.

"When I became aware that the city of Flint's water showed elevated lead levels and that the state's handling of the situation was being questioned," he said. "I requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible missteps and areas for improvement.

"The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials ... We'll continue to work with the community members to make sure we hear and respond to their concerns.

"MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force."

In a previous FOX 2 report it was discovered a year after the city began using the Flint River as its water source; a local hospital's study found the number of Flint kids under the age of 5 years old with above average lead levels nearly doubled city-wide and in some cases, tripled.

Virginia Tech University tested resident Ronda Thornton's water. Anything more than 30 micrograms a liter is a sign of serious lead contamination. Hers registered 138.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

"But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

Director Dan Wyant resigns after task force blasts MDEQ over Flint water crisis

All Stories

FLINT, MI – Mayor Karen Weaver and other local leaders say the resignation of Michigan Department of Environmental Quality Director Dan Wyant and release of Flint Water Task Force findings Tuesday are the first steps toward holding people accountable for Flint's water crisis.

"There is some accountability being put in place and that's a good thing," Weaver said. "That's what is happening and I think that's a good sign because it shows that our voices have been heard and that they will continue to be heard."

According to a statement issued by Gov. Rick Snyder on Dec. 29, he has accepted Wyant's resignation after findings from a report by the task force, which was created by Snyder in October to look into Flint's water crisis. In the same statement, Snyder also said he was "sorry" to the Flint community for the water issues.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust ... Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Weaver confirmed that she will be meeting with Snyder after the first of the year.

"I hope this will help move Flint forward," she said. "One thing that has been an issue for us here in Flint has been that broken trust. We will have a new person that we will be working with, and that's a positive step."

The task force report, which is preliminary, revealed that the MDEQ failed the city in multiple areas including regulatory failures, substance and tone of the MDEQ's response to public and the interpretation of the federal lead and copper rule.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," said the preliminary report. "Although many individuals and entities at state and local levels contributed to creating a prolonging problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable."

State Rep. Sheldon Neeley, D-Flint, said that he and others in the city have called for legislative hearings regarding the water crisis and that Wyant's departure is just the first, not the only, person held responsible for the condition of Flint's water.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or have Gov. Rick Snyder do the deed for him," Neeley said in a statement issued Dec. 29. "There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders."

Neeley, who along with Sen. Jim Ananich, D-Flint, have been pushing for legislative hearings on Flint's water crisis, went on to say there is still "cleanup do be done" and he is "glad" that Wyant has stepped down in what Neeley considers a "disorganized and flawed DEQ."

The task force's report also says members spoke with Wyant on Dec. 16 and they were not pleased with how he responded to the city's water crisis and he was in agreement with some of their findings.

"It is our understanding that he has drawn similar conclusions in his own evaluation of MDEQ's role in the Flint water crisis," said the report. "At the same time, it was disappointing to hear his weak defense of the CCT (corrosion control treatment) decision based on the EPA's November 2015 memorandum."

Both Ananich and Neeley's push led to an independent review by the Office of State Auditor Genera,l which made it clear in a Dec. 23 letter that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water.

The review was based on a series of questions sent to the auditor from Ananich in October.

The corrosiveness of Flint River water is blamed for lead that leached from pipes into drinking water, causing elevated levels of lead in the blood of Flint children.

"I think the best apology (Snyder) can offer the residents of Flint and the rest of the state is a promise that this will never happen again," Ananich said. "The proof is in the long-term commitment. I'm going to continue to work to make sure that we get that."

Michigan Gov. Rick Snyder apologizes for lead levels in Flint water (Detroit 4)

DEQ head Dan Wyant's resigns after task force blames department for crisis

By Jason Colthorp – Reporter

http://www.clickondetroit.com/news/michigan-official-resigns-amid-flint-water-issue_

LANSING, Mich. - Gov. Rick Snyder issued an apology Tuesday as Dan Wyant, his head of the Department of Environmental Quality, resigned after a task force lead by the state's auditor general blasted the DEQ for it's role in Flint's water crisis.

The state's mishandling of Flint's water system ultimately exposed Flint residents to dangerously elevated levels of lead.

“I want the Flint community to know how very sorry I am that this has happened,” Snyder said in a statement. “And I want all Michigan citizens to know that we will learn from this experience.”

The governor's apology and the DEQ head's resignation has helped to temper concerns that no one cared about Flint said the city's mayor Karen Weaver.

“One of the things we've always talked about is accountability and that seems to be what's happening,” said Weaver. “It also let us know here in Flint that our voice is being heard.”

Snyder's apology and Wyant's resignation come after the task force released their finding that the DEQ was primarily at fault for Flint's unhealthy level of lead in their drinking water.

“Although many contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan,” the task force said in a written statement. “It failed in that responsibility.”

For many Flint residents like Kim Peterson, Tuesday's announcements do little to help them feel confident about the safety of their drinking water. Peterson says she is still hesitant to drink the water even though it is again coming from a healthy source in Lake

Huron.

“I take it to mean that something was really wrong with this whole system of checks and balances,” she said.

“You don't trust it because you've heard so many conflicting things from so many different people, so we still continue to buy the water.”

Mayor Weaver, however, believes Snyder’s apology is a first step toward rebuilding trust: “This is a good step to get some things started because people had lost faith and they had lost trust.”

Snyder has promised more steps will be taken after the task force releases its final and full report.

LANSING, MI -- Gov. Rick Snyder on Tuesday accepted a resignation from Michigan Department of Environmental Quality Director Dan Wyant after a task force laid responsibility for the Flint water crisis at the feet of the department.
Snyder, in a statement, announced Wyant's resignation and apologized to Flint residents after he received a letter from the Flint Water Advisory Task Force.
"...MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force," Snyder said.
Wyant and the DEQ have come under fire in recent months for handling a Flint drinking water crisis that lead to corrosive water running through city pipes and resulted in children with elevated levels of lead. In October, Wyant acknowledgeda mistake in oversight from his office, saying DEQ officials were confused about federal regulations on making the drinking water less corrosive.
The task force in its letter blamed the department for the crisis.
"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," read the letter to Snyder.
"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure."
The task force cited DEQ's involvement as regulatory failure, failure in substance and

tone of response to the public and a failure of interpreting the lead and copper rule.

Gov. Rick Snyder recently named the Flint water crisis as his biggest disappointment in 2015.

Wyant had a long track record of service for the state. He served as director of the Michigan Department of Agriculture under both Democratic Gov. Jennifer Granholm and Republican Gov. John Engler before Gov. Rick Snyder tapped him to head up the DEQ in 2011.

He shepherded the department through a transition into being its own entity again after Gov. Jennifer Granholm had combined it with the Department of Natural Resources, forming the Department of Natural Resources and Environment. He also led the "quality of life group" within state government, meaning he coordinated efforts between the DNR, DEQ and Department of Agriculture and Rural Development.

The statement from Snyder alluded to other structural changes within the DEQ, and spokesperson Dave Murray said those decisions would be made in the coming days.

DEQ spokesperson Brad Wurfel did not immediately return a call for comment.

Wyant's resignation met with mixed reaction from political groups and leaders.

Senate Minority Leader Jim Ananich (D-Flint) released the following statement:

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress. I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again."

Attorney General Bill Schuette praised Wyant's service to the state.

"I am saddened to hear of the resignation of Department of Environment Quality Director Dan Wyant. In my 20-plus years of knowing him, Dan has been a hardworking, dedicated public servant. I am committed to working with all parties, including the legislature and Governor, to ensure the public's health and the well being of Michigan residents."

Democratic Congressman Dan Kildee, who represents Flint, said the steps taken today were appropriate but encouraged further action.

"Governor Snyder's apology over the Flint water crisis is appropriate, as are personnel changes announced today at the Department of Environmental Quality," Kildee said.

"Through this ongoing crisis, the people of Flint did nothing wrong – they are victims of this failure of government. The State of Michigan must not only acknowledge its role in this crisis, but also take responsibility and act right away to make it right."

He urged the state to establish a fund to ensure that kids receive developmental, nutritional and educational resources to help overcome the effects of their lead exposure.

Rep. Sheldon Neeley, D-Flint, said Wyant was not the only offender.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or to have Gov. Rick Snyder do the deed for him. There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders," Neeley said.

"While there is still much cleanup to be done, I am glad Mr. Wyant realized he could no longer continue as the head of the disorganized and flawed DEQ, and I call on Gov. Snyder to take careful effort in repairing this department so that it earns back the trust of the people of Flint and this great state.

Progress Michigan said there had been a lack of accountability for the Flint water crisis. "So far under Gov. Rick Snyder's watch, there has been zero accountability in this crisis and that continues today," said Lonnie Scott, executive director of Progress Michigan. "Dan Wyant gets to walk away from this criss, but the people of Flint do not. There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable. All documentation related this this crisis needs to be released to the public immediately."

Auditor: State erred on Flint water but didn't mislead feds (AP/Crain's Detroit)
http://www.crainsdetroit.com/article/20151228/NEWS01/151229867/auditor-state-erred-on-flint-water-but-didnt-mislead-feds By David Eggert
Associated Press
Michigan Department of Environmental Quality Environment More +
LANSING — The director of Michigan's Department of Environmental Quality has resigned after the Flint Water Task Force delivered its findings on the the city's water contamination crisis to Gov. Rick Snyder.
Snyder said Tuesday afternoon in a statement that he accepted the resignation of Dan Wyant and plans to make "other personnel changes at MDEQ to address problems cited by the task force.
"But changes in leadership and staff are not enough."
In a preliminary report released Monday, Michigan's auditor general said state regulators should have required Flint to treat its corrosive drinking water to keep lead from leaching from service lines into people's homes but did not purposely mislead federal officials about the lack of corrosion control.
Doug Ringler, citing a memo issued last month by the U.S. Environmental Protection Agency, concluded that the Michigan Department of Environmental Quality erred in not requiring the city to immediately combat corrosion when it switched from Detroit's system to the Flint River in April 2014 in a cost-cutting move while under state financial management. State officials interpreted federal rules to mean Flint could make the transition and then test the new water for lead over two six-month intervals to determine potential corrosion treatment.
Flint children have been found to have elevated levels of lead in their blood since the water change. Gov. Rick Snyder's administration initially downplayed concerns but later committed funding to reconnect Flint to Detroit and to provide filters, testing and other services.
Ringler was already conducting an audit of Michigan's Office of Drinking Water and Municipal Assistance when the Flint corrosion issue arose. At the request of Senate Minority Leader Jim Ananich, he answered questions specific to Flint's lead contamination, including concerns that state regulators misled federal environmental regulators.
In February, a DEQ water supervisor told the EPA that Flint had a corrosion control program in place. But in April, an EPA official confirmed through another DEQ official that the city was not practicing corrosion treatment, according to emails.

The EPA apparently interpreted the word "program" to mean treatment, while the DEQ meant it as testing to determine if corrosion controls would be needed in the future.

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA," Ringler wrote in a letter dated Wednesday and made public Monday.

The auditor concluded, however, that regardless of confusion over the federal rule, the state should have required Flint to start pursuing corrosion treatment in March after the first six months of testing showed too-high lead levels instead of waiting until August after a second six-month period. He also said the DEQ did not verify that Flint was correctly sampling water from houses only with lead pipes or lead service lines. He suggested that the department consider doing so.

"We agreed with the findings in the Auditor General's review," DEQ spokesman Brad Wurfel said. "The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues."

The Republican governor has come under scrutiny for the Flint fiasco. Spokesman Dave Murray said the letter "includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified. But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels."

Ananich, D-Flint, said "there are serious failings in our system that must be addressed" and again called for GOP leaders to schedule legislative hearings. They have rejected the requests, citing the work of a task force formed by Snyder.

The auditor's letter did not provide clarity on who specifically decided to use the Flint River for water. It was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

Ringler noted that the city council voted in March 2013 to support moving to the Karegnondi Water Authority but was "silent" on using the river temporarily. Flint was being run by a Snyder-appointed manager until this past April and remains under some state oversight.

BREAKING: DEQ Director Resigns Over Flint Water Crisis (West Bloomfield Patch)

Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.

http://patch.com/michigan/westbloomfield/breaking-deq-director-resigns-over-flint-water-crisis

West Bloomfield, MI

By BETH DALBEY (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.

DEQ Director Dan Wyant “has offered his resignation, and I’ve determined that it’s appropriate to accept it,” Snyder said in a statement.

The governor said he will be “making other personnel changes at MDEQ” as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency reliefto deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

State Delayed Action on Lead in Flint Water
The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

Opioid Addicts Younger Than Ever: Study

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.
The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to theWorld Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

“I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure,” he wrote.

Changes in leadership and staff aren’t enough, Snyder said. The statement continued:

“I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

“Let’s share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions,” he wrote. “Together, we should work to affirm that we’re using the very best testing protocols to ensure Flint residents have safe drinking water and that we’re taking steps to protect their health over the short and long term.

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

MDEQ Director Wyant resigns over Flint water crisis, Snyder apologizes (Michigan Radio)

UPDATED AT 5:37 PM ON 12/29/15

The head of the Michigan Department of Environmental Quality (MDEQ) has resigned over the drinking water crisis in Flint.

Gov. Rick Snyder has also now apologized to the community of Flint for his administration’s involvement in the situation.

“I want the Flint community to know how very sorry I am that this has happened,” said Snyder in a statement on Tuesday. “And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

MDEQ Director Dan Wyant will step down immediately. The resignation comes after Snyder received initial findings from the task force he appointed to investigate the situation. A number of reports have pointed to mistakes the department made that resulted in elevated lead levels in the city's water.

The governor says he plans to make additional personnel changes in the department – although he hasn't announced what those will be. And he says he'll meet with Flint Mayer Karen Weaver to discuss further actions the state could take to help the city.

Also resigning from the MDEQ today was spokesman Brad Wurfel.

Letter says the state department is at fault in Flint Water Crisis (WLNS News 6)
http://wlns.com/2015/12/30/letter-says-the-state-department-is-at-fault-in-flint-water-crisis/

LANSING, MI. (WLNS) – At the state capital, a letter sent to Governor Snyder from his Flint Water Crisis task force says there's a state department to blame for the city's water problems.

In the letter the task force says the Department of Environmental Quality must be held accountable for failing to ensure the safe drinking water for people of Flint.

It says Flint residents were exposed to toxic levels of lead in their water because of a culture of passive compliance.

In addition to the letter, Dan Wyant stepped down as director of the department

I think we need to reach out to TRMS to correct the repeated references to a "EPA whistleblower/rogue employee" that appear in this segment and previous segments. Our review of EPA actions in Flint show that the so-called whistleblower/rogue employee was acting under the direction of and with the support of EPA management when he tested water at three residences in Flint and prepared a report summarizing his findings. I personally objected to MDEQ management and the Governor's office when they called this R5 staffer a "rogue employee." This misrepresentation is especially problematic in the wake of the House Oversight hearing last summer, which focused on alleged whistleblowers in R5. I don't know if we need to ask for a formal correction, but we should at least ask TRMS to avoid this inaccurate characterization in future segments.

I am happy to talk about this if you would like us to set up a call.

LANSING — Gov. Rick Snyder apologized to the City of Flint on Tuesday for the drinking water crisis that has left children poisoned by lead and announced that he accepted the resignation of Michigan Department of Environmental Quality Director Dan Wyant.
Snyder said in a news release that there will be other personnel changes at the DEQ and that the moves he announced are among "initial steps" he is taking to assure the safety of Flint residents, with more action to come.
"I want the Flint community to know how very sorry I am that this has happened," Snyder said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The governor, who previously stood by his DEQ director amid the controversy, said, "Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it."

Before joining the Snyder administration as DEQ director, Wyant was president and chief operating officer of the Edward Lowe Foundation, which promotes entrepreneurship and helps business owners grow their companies. Before that, he served as director of the Michigan Department of Agriculture under Govs. John Engler and Jennifer Granholm.

Brad Wurfel, the DEQ public information officer who apologized after criticizing a researcher's reports of rising lead levels in the blood of Flint children as irresponsible, also resigned Tuesday, a spokesman for Snyder confirmed.

The governor said he acted based on interim findings of the Flint Water Advisory Task Force, which he appointed Oct. 21 to investigate the crisis and is continuing its work. He received a letter Tuesday morning that was highly critical of the DEQ.

The letter from the task force said the "primary responsibility" for what happened in Flint lies with the DEQ; the agency "failed in its responsibility" to ensure safe drinking water for Michigan residents and "must be held accountable for that failure." It was signed by task force members Matt Davis, Chris Kolb, Larry Reynolds, Eric Rothstein and Ken Sikkema.

The Free Press reported Thursday that records obtained by the Michigan ACLU and Virginia Tech researcher Marc Edwards show that elevated lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the DEQ to wrongly indicate the water was safe to drink.

Auditor General Doug Ringler said in a letter released Monday that it was appropriate for the DEQ to disqualify two samples with high lead levels that did not meet the sampling criteria. But the records obtained by the ACLU and Edwards also show that a DEQ official sent Flint an e-mail saying that samples as of late June showed Flint's water had lead levels above the "action level" that would require public notice and remedial action, and he hoped the city could send the remaining required samples quickly and that they would be below the action level for lead.

The records also suggest the DEQ was not as strict in disqualifying samples with low lead levels that did not meet the testing criteria as it was in disqualifying samples with high lead readings.

'It's ... not enough'

Flint, which was under the control of a state-appointed emergency manager at the time of the cost-cutting move, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

The state has acknowledged that it misinterpreted a federal rule and failed to require Flint to add needed corrosion-control chemicals that would have prevented lead from leaching into the drinking water from pipes, connections and fixtures.

That change in the drinking-water source brought immediate complaints from Flint residents about the taste, smell and appearance of the water. The lead tests of the water could have spurred action in July, but it was not until October — after blood test results analyzed by Hurley Children's Hospital pediatrician Dr. Mona Hanna-

Attisha showed elevated lead levels in Flint children — that the DEQ admitted making a mistake by failing to require the addition of corrosion-control chemicals to the Flint River water. The state also then provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

Lead can cause irreversible brain damage in children and has also been linked to behavioral problems.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said she was more shocked by Snyder's apology than by Wyant's resignation. She welcomed the announcements but said more DEQ officials need to be removed because Flint residents can't trust those officials to make sure their water is safe to drink today.

"This all should have happened a long time ago, and it's also not enough," she said.

Mays questioned why Snyder has not endorsed Flint Mayor Karen Weaver's declaration of a state of emergency in Flint, which she said would help secure federal funding to help rectify problems.

Snyder spokesman Dave Murray said "no formal request has been made to the state" to declare a state of emergency in Flint.

"We are committed to working with Mayor Weaver and Genesee County leaders," and the emergency management division of the Michigan State Police is working with city and county officials on potential avenues for federal aid, Murray said.

The crisis has prompted a federal class-action and calls for an investigation by the U.S. Department of Justice.

Goals: Openness, trust

Snyder said "changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water."

Snyder said he wants to "share research on water and blood-lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

The other personnel changes at DEQ referenced by Snyder, aside from Wurfel's resignation, have not yet been made, Murray said.

“I know many Flint citizens are angry and want more than an apology," Snyder said. "That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

The letter from the task force said a minimalist culture of "technical compliance" had developed in the DEQ's Office of Drinking Water and Municipal Assistance and "it led to MDEQ's failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

The office "must adopt a posture that is driven not by this minimalist technical compliance approach, but rather by one that is founded on what needs to be done to assure drinking water safety," the letter said.

The letter also said that both the tone and substance of DEQ statements to the public during the crisis were "completely unacceptable," marked by a "persistent tone of scorn and derision."

Task force members met with Wyant, and while he agreed with many of the task force's interim conclusions, "it was disappointing to hear his weak defense of the (corrosion control) decision," the letter said.

Senate Minority Leader Jim Ananich, D-Flint, said the personnel changes Snyder announced could be a sign of progress if they "lead to a more aggressive response and resources to improve public health."

"I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again," Ananich said in a news release.

"Dan Wyant gets to walk away from this crisis, but the people of Flint do not," said Lonnie Scott, the group's executive director. "There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable."

(Photo: Dale G. Young / The Detroit News)

Michigan's top environmental official resigned Tuesday after an independent task force delivered its initial findings on the Flint water contamination crisis — conclusions that also prompted an apology from Gov. Rick Snyder.

Dan Wyant, director of the Department of Environmental Quality since 2011, tendered his resignation Tuesday, marking the second agency shakeup in just over two months related to Flint's lead-tainted drinking water problems. The industrial city has been plagued by lead issues since an April 2014 switch to the Flint River as its water source.

A Snyder-appointed task force investigating the long-running situation announced it found Tuesday the DEQ "primarily responsible for failing to ensure safe drinking water in Flint." Snyder accepted the initial findings and Wyant's resignation — "I've determined that it's appropriate to accept it, he said — and then issued an apology.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a press release. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

A Flint Water Advisory Task Force co-chair blamed the DEQ's passive culture for Flint's water ills.

"Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance that is simply insufficient to the task of public protection," wrote Ken Sikkema, a former state senator. "We also believe that the dismissive and disrespectful tone of much of the MDEQ's response to public concerns is unacceptable."

The water switch, made while Flint was under the leadership of a Snyder-appointed emergency manager, immediately led to resident complaints about the smell, taste and discoloration of their drinking water. Eventually, researchers found a link between the switch and a rise in lead poisoning among city children.

Lead poisoning can cause learning disabilities and, at high levels, may lead to seizures, coma and death, according to the Centers for Disease Control and Prevention.

Wyant could not be reached for comment Tuesday. In October, Wyant admitted the DEQ erred in its application of the federal Lead and Copper Rule, designed to ensure safe drinking water for residents.

Late on Tuesday, DEQ spokesman Brad Wurfel resigned as well.

Flint was allowed to begin drawing its drinking water from the river without any corrosion controls in place to prevent lead in old plumbing connections from leaching. The task force said the DEQ failed in the regulatory handling of Flint's water problems, the "substance and tone" in the department's response as well as its "interpretation of the Lead and Copper Rule."

State Sen. Jim Ananich, D-Flint, criticized the DEQ culture Tuesday, saying workers were more concerned with following rules than informing the public about potential problems.

"When you have lead in the water, I don't care if you follow the rules or not: You need to notify the public first," Ananich said.

Critics have put increasing pressure on Snyder's administration to answer for the Flint water decisions in the last two years. Among the harshest critics is Marc Edwards, a Virginia Tech researcher whose water sampling at Flint homes and public record requests have helped keep the spotlight on the state government's actions.

But Edwards said Wyant should not be the one on the chopping block.

"I'm glad that someone is sorry and someone is being held accountable," Edwards said. "But Dan Wyant would not be at the top of my list — or even on the list. I feel strongly he was misled by his staff at every point, and he was put in publicly embarrassing situations by the staff's misinformation."

Dr. Mona Hanna-Attisha, a Hurley Medical Center pediatrician who uncovered lead exposure in city children following the switch, echoed Edwards by saying DEQ staffers' mistakes led to Flint's problems.

"(Wyant) wasn't directly involved," she said. "There are other people, particularly in (the Office of Drinking Water and Municipal Assistance), that need to take some responsibility. ... (Wyant) was a nice person being fed bad information."

In 2013, Flint agreed to create a new regional water authority in an attempt to save money. The city had tried to negotiate lower rates with former provider Detroit Water and Sewerage Department for years, to little avail.

But the Karegondi Water Authority will not be completed until some time next year. In the interim, Flint looked to its river to provide drinking water. That water turned out to be far more corrosive than the Lake Huron water used by the Detroit system. With pressure mounting from troublesome water samples and health studies, Flint reconnected to the Detroit system in October.

Snyder previously was elusive in acknowledging the extent of the state's responsibility for the lead contamination of the city's water when it switched to the more corrosive Flint River in 2014, saying he was awaiting the task force report. On Tuesday, the governor was more contrite.

“We've already allocated $10 million to test the water, distribute water filters, and help in other ways,” Snyder said. “Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.”

Michigan Regulator Resigns Amid Flint's Lead-in-Water Crisis (AP)
By DAVID EGGERT, ASSOCIATED PRESS
LANSING, Mich. — Dec 29, 2015, 7:16 PM ET
http://abcnews.go.com/Politics/wireStory/michigan-official-resigns-amid-flint-water-issue-35996502

Michigan's top environmental regulator resigned Tuesday after elevated levels of lead were found in Flint children during a drinking water crisis that a task force blamed primarily on his agency.

Gov. Rick Snyder accepted the resignation of Department of Environmental Quality Director Dan Wyant and apologized for what occurred in Flint, which switched its drinking water supply in a cost-cutting move while under state financial management. Communications director Brad Wurfel also resigned, and Snyder said he plans additional personnel changes in the agency.

Wyant quit the same day a task force appointed by the Republican governor reported that the department was primarily responsible for the fiasco because it did not require Flint to keep corrosive water from leaching lead from service pipes into residents' homes and belittled concerns from the public. Exposure to lead can cause behavior problems and learning disabilities in children.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a written statement. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The five-member task force, which previously brought up concerns about a lack of organization in responding to the disaster, said the environmental department's Office of Drinking Water and Municipal Assistance has a "minimalist approach" to regulatory oversight in which "technical compliance" is sufficient. It faulted the agency for a "tone of scorn and derision" toward the public, including outside water and health experts who raised alarm bells.

The task force confirmed that the state did not follow the federal Lead and Copper

Rule when Flint disconnected from Detroit's water system in April 2014 and switched to Flint River water while waiting to connect to a new regional water authority.

Detroit's water from Lake Huron had been treated for corrosion. State officials thought that after Flint made the transition to the river it could test the new water for lead over two six-month intervals to determine potential corrosion treatment instead of needing to immediately add corrosion controls. Flint returned to Detroit's water in October after a public health emergency was declared.

The task force, which met with Wyant on Dec. 16, noted his substantial agreement with many of its conclusions but expressed disappointment with his "weak defense" regarding the federal rule.

The U.S. Environmental Protection Agency said in a November memo that there are "differing possible interpretations" of the Lead and Copper Rule, explaining that it does not explicitly discuss a scenario like in Flint.

But task force members said, "Individuals and agencies responsible must be held accountable in a timely fashion."

They also cited recent revelations of the Department of Health and Human Services' apparent early knowledge of and silence about elevated blood-lead levels, and said the committee's final report in early 2016 would review local governments' decision processes while under emergency management.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust," Snyder said.

Wyant, 56, led the Environmental Quality Department for nearly five years. He previously served as the state's agricultural director under Republican Gov. John Engler and Democratic Gov. Jennifer Granholm.

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress," said Senate Minority Leader Jim Ananich, a Democrat from Flint.

Task force lays most blame for Flint water crisis on MDEQ (Michigan Radio)

By VINCENT DUFFY • 14 HOURS AGO

SHARETwitter Facebook Google+ Email

http://michiganradio.org/post/task-force-lays-most-blame-flint-water-crisis-mdeq#stream/0

MDEQ Director Dan Wyant at a recent press conference.

CREDIT SCREEN GRAB / MLIVE USTREAM

A task force appointed by Gov. Rick Snyder says Michigan's environmental regulatory agency is primarily responsible for the state's failure to ensure safe drinking water for Flint residents.

The Flint Water Advisory Task Force says in a letter to Snyder that the state Department of Environmental Quality "must be held accountable for that failure."

The letter was made public Tuesday. You can read it here.

Corrosive Flint River water leached lead from service pipes into homes after the city switched last year from Detroit water. Elevated blood-lead levels later were found in some children.

Department of Environmental Quality Director Dan Wyant and spokesman Brad Wurfel both resigned Tuesday.

Task force co-chair Ken Sikkema says in the letter that "Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance."

The FWATF letter stated in part:

“We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ). Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure.”

“The City of Flint’s water customers—fellow Michigan citizens—were needlessly and tragically exposed to toxic levels of lead through their drinking water supply. They deserve a commitment to properly assess responsibility and ensure accountability. They also deserve a commitment to needed mitigation in both the short and long term. The Flint water crisis never should have happened. Having failed to prevent it, state government should coordinate a sustained, public-health-focused response to remedy, to the fullest extent possible, the impacts on the Flint community.”

The letter outlined three areas where MDEQ failed:

Regulatory Failure
Failure in Substance and Tone of MDEQ Response to the Public
Failure in MDEQ Interpretation of the Lead and Copper Rule
This is the second letter sent by the Task Force. The first, sent earlier this month, made several recommendations concerning coordination of state efforts that were supported and implemented by Governor Snyder.

The full FWATF report is expected to be completed in early 2016.

Members of the Task Force include:

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan.

Chris Kolb is president of the Michigan Environmental Council.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority.

Ken Sikkema is a senior policy fellow at Public Sector Consultants. (Full Disclosure - he is also a regular commenter on Michigan Radio.)

The FWATF was formed by Governor Snyder to review actions regarding the Flint water system and offer recommendations both for Flint and Michigan to protect the health and safety of state residents.

Flint water scandal: Snyder apologizes, DEQ director resigns (Fox 2 Detroit)

Gov. Rick Snyder announced changes at the Michigan DEQ.
http://www.fox2detroit.com/news/local-news/66000998-story

POSTED:DEC 29 2015 10:25PM EST
UPDATED:DEC 29 2015 11:24PM EST
FLINT, Mich. - Gov. Rick Snyder says he's sorry for Flint's water crisis as one of his top appointees resigns.
The director of the state's department of environmental quality Dan Wyant resigned.

Wyant was in charge of keeping the water safe. When Flint switched its drinking water source from Lake Huron water supplied by detroit...to the flint river - to save money -- corrosion flowed through the pipes.

Tests showed elevated levels of lead in the city's drinking water back in June. But the state didn't take action until October after blood testing showed high lead levels in Flint's children.
Flint water scandal: Snyder apologizes, DEQ director resigns
Snyder's office issued a press release Tuesday:
"I want the Flint community to know how very sorry I am that this has happened," he said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.
"When I became aware that the city of Flint's water showed elevated lead levels and that the state's handling of the situation was being questioned," he said. "I

requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible missteps and areas for improvement.

"The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials ... We'll continue to work with the community members to make sure we hear and respond to their concerns.

"MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force."

In a previous FOX 2 report it was discovered a year after the city began using the Flint River as its water source; a local hospital's study found the number of Flint kids under the age of 5 years old with above average lead levels nearly doubled city-wide and in some cases, tripled.

Virginia Tech University tested resident Ronda Thornton's water. Anything more than 30 micrograms a liter is a sign of serious lead contamination. Hers registered 138.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

"But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

Director Dan Wyant resigns after task force blasts MDEQ over Flint water crisis
All Stories

FLINT, MI – Mayor Karen Weaver and other local leaders say the resignation of Michigan Department of Environmental Quality Director Dan Wyant and release of Flint Water Task Force findings Tuesday are the first steps toward holding people accountable for Flint's water crisis.

"There is some accountability being put in place and that's a good thing," Weaver said. "That's what is happening and I think that's a good sign because it shows that our voices have been heard and that they will continue to be heard."

According to a statement issued by Gov. Rick Snyder on Dec. 29, he has accepted Wyant's resignation after findings from a report by the task force, which was created by Snyder in October to look into Flint's water crisis. In the same statement, Snyder also said he was "sorry" to the Flint community for the water issues.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust ... Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Weaver confirmed that she will be meeting with Snyder after the first of the year.

"I hope this will help move Flint forward," she said. "One thing that has been an issue for us here in Flint has been that broken trust. We will have a new person that we will be working with, and that's a positive step."

The task force report, which is preliminary, revealed that the MDEQ failed the city in multiple areas including regulatory failures, substance and tone of the MDEQ's response to public and the interpretation of the federal lead and copper rule.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," said the preliminary report. "Although many individuals and entities at state and local levels contributed to creating a prolonging problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable."

State Rep. Sheldon Neeley, D-Flint, said that he and others in the city have called for legislative hearings regarding the water crisis and that Wyant's departure is just the first, not the only, person held responsible for the condition of Flint's water.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or have Gov. Rick Snyder do the deed for him," Neeley said in a statement issued Dec. 29. "There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders."

Neeley, who along with Sen. Jim Ananich, D-Flint, have been pushing for legislative hearings on Flint's water crisis, went on to say there is still "cleanup do be done" and he is "glad" that Wyant has stepped down in what Neeley considers a "disorganized and flawed DEQ."

The task force's report also says members spoke with Wyant on Dec. 16 and they were not pleased with how he responded to the city's water crisis and he was in agreement with some of their findings.

"It is our understanding that he has drawn similar conclusions in his own evaluation of MDEQ's role in the Flint water crisis," said the report. "At the same time, it was disappointing to hear his weak defense of the CCT (corrosion control treatment) decision based on the EPA's November 2015 memorandum."

Both Ananich and Neeley's push led to an independent review by the Office of State Auditor Genera,l which made it clear in a Dec. 23 letter that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water. The review was based on a series of questions sent to the auditor from Ananich in October.

The corrosiveness of Flint River water is blamed for lead that leached from pipes into drinking water, causing elevated levels of lead in the blood of Flint children.

"I think the best apology (Snyder) can offer the residents of Flint and the rest of the state is a promise that this will never happen again," Ananich said. "The proof is in the long-term commitment. I'm going to continue to work to make sure that we get that."

Michigan Gov. Rick Snyder apologizes for lead levels in Flint water (Detroit 4)

DEQ head Dan Wyant's resigns after task force blames department for crisis

By Jason Colthorp – Reporter

http://www.clickondetroit.com/news/michigan-official-resigns-amid-flint-water-issue

LANSING, Mich. - Gov. Rick Snyder issued an apology Tuesday as Dan Wyant, his head of the Department of Environmental Quality, resigned after a task force lead by the state's auditor general blasted the DEQ for it's role in Flint's water crisis.

The state's mishandling of Flint's water system ultimately exposed Flint residents to dangerously elevated levels of lead.

“I want the Flint community to know how very sorry I am that this has happened,” Snyder said in a statement. “And I want all Michigan citizens to know that we will learn from this experience.”

The governor's apology and the DEQ head's resignation has helped to temper concerns that no one cared about Flint said the city's mayor Karen Weaver.

“One of the things we've always talked about is accountability and that seems to be what's happening,” said Weaver. “It also let us know here in Flint that our voice is being heard.”

Snyder's apology and Wyant's resignation come after the task force released their finding that the DEQ was primarily at fault for Flint's unhealthy level of lead in their drinking water.

“Although many contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan,” the task force said in a written statement. “It failed in that responsibility.”

For many Flint residents like Kim Peterson, Tuesday's announcements do little to help them feel confident about the safety of their drinking water. Peterson says she is still hesitant to drink the water even though it is again coming from a healthy source in Lake Huron.

“I take it to mean that something was really wrong with this whole system of checks and balances,” she said.

“You don't trust it because you've heard so many conflicting things from so many different people, so we still continue to buy the water.”

Mayor Weaver, however, believes Snyder’s apology is a first step toward rebuilding trust: “This is a good step to get some things started because people had lost faith and they had lost trust.”

Snyder has promised more steps will be taken after the task force releases its final and full report.

By Emily Lawler | elawler@mlive.com
on December 29, 2015 at 4:39 PM, updated December 29, 2015 at 6:51 PM
LANSING, MI -- Gov. Rick Snyder on Tuesday accepted a resignation from Michigan Department of Environmental Quality Director Dan Wyant after a task force laid responsibility for the Flint water crisis at the feet of the department.
Snyder, in a statement, announced Wyant's resignation and apologized to Flint residents after he received a letter from the Flint Water Advisory Task Force.
"...MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force," Snyder said.
Wyant and the DEQ have come under fire in recent months for handling a Flint drinking water crisis that lead to corrosive water running through city pipes and resulted in children with elevated levels of lead. In October, Wyant acknowledgeda mistake in oversight from his office, saying DEQ officials were confused about federal regulations on making the drinking water less corrosive.
The task force in its letter blamed the department for the crisis.
"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," read the letter to Snyder.
"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that

responsibility and must be held accountable for that failure."

The task force cited DEQ's involvement as regulatory failure, failure in substance and tone of response to the public and a failure of interpreting the lead and copper rule.

Gov. Rick Snyder recently named the Flint water crisis as his biggest disappointment in 2015.

Wyant had a long track record of service for the state. He served as director of the Michigan Department of Agriculture under both Democratic Gov. Jennifer Granholm and Republican Gov. John Engler before Gov. Rick Snyder tapped him to head up the DEQ in 2011.

He shepherded the department through a transition into being its own entity again after Gov. Jennifer Granholm had combined it with the Department of Natural Resources, forming the Department of Natural Resources and Environment. He also led the "quality of life group" within state government, meaning he coordinated efforts between the DNR, DEQ and Department of Agriculture and Rural Development.

The statement from Snyder alluded to other structural changes within the DEQ, and spokesperson Dave Murray said those decisions would be made in the coming days. DEQ spokesperson Brad Wurfel did not immediately return a call for comment.

Wyant's resignation met with mixed reaction from political groups and leaders.

Senate Minority Leader Jim Ananich (D-Flint) released the following statement:

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress. I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again."

Attorney General Bill Schuette praised Wyant's service to the state.

"I am saddened to hear of the resignation of Department of Environment Quality Director Dan Wyant. In my 20-plus years of knowing him, Dan has been a hardworking, dedicated public servant. I am committed to working with all parties, including the legislature and Governor, to ensure the public's health and the well being of Michigan residents."

Democratic Congressman Dan Kildee, who represents Flint, said the steps taken today were appropriate but encouraged further action.

"Governor Snyder's apology over the Flint water crisis is appropriate, as are personnel changes announced today at the Department of Environmental Quality," Kildee said.

"Through this ongoing crisis, the people of Flint did nothing wrong – they are victims of this failure of government. The State of Michigan must not only acknowledge its role in this crisis, but also take responsibility and act right away to make it right."

He urged the state to establish a fund to ensure that kids receive developmental, nutritional and educational resources to help overcome the effects of their lead exposure.

Rep. Sheldon Neeley, D-Flint, said Wyant was not the only offender.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or to have Gov. Rick Snyder do the deed for him. There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders," Neeley said.

"While there is still much cleanup to be done, I am glad Mr. Wyant realized he could no longer continue as the head of the disorganized and flawed DEQ, and I call on Gov. Snyder to take careful effort in repairing this department so that it earns back the trust of the people of Flint and this great state.

Progress Michigan said there had been a lack of accountability for the Flint water crisis.

"So far under Gov. Rick Snyder's watch, there has been zero accountability in this crisis and that continues today," said Lonnie Scott, executive director of Progress Michigan.

"Dan Wyant gets to walk away from this criss, but the people of Flint do not. There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable. All documentation related this this crisis needs to be released to the public immediately."

Auditor: State erred on Flint water but didn't mislead feds (AP/Crain's Detroit)

http://www.crainsdetroit.com/article/20151228/NEWS01/151229867/auditor-state-erred-on-flint-water-but-didnt-mislead-feds By David Eggert

Associated Press

Michigan Department of Environmental Quality Environment More +

LANSING — The director of Michigan's Department of Environmental Quality has resigned after the Flint Water Task Force delivered its findings on the the city's water contamination crisis to Gov. Rick Snyder.

Snyder said Tuesday afternoon in a statement that he accepted the resignation of Dan Wyant and plans to make "other personnel changes at MDEQ to address problems cited by the task force.

“But changes in leadership and staff are not enough."

In a preliminary report released Monday, Michigan's auditor general said state regulators should have required Flint to treat its corrosive drinking water to keep lead from leaching from service lines into people's homes but did not purposely mislead federal officials about the lack of corrosion control.

Doug Ringler, citing a memo issued last month by the U.S. Environmental Protection Agency, concluded that the Michigan Department of Environmental Quality erred in not requiring the city to immediately combat corrosion when it switched from Detroit's system to the Flint River in April 2014 in a cost-cutting move while under state financial management. State officials interpreted federal rules to mean Flint could make the transition and then test the new water for lead over two six-month intervals to determine potential corrosion treatment.

Flint children have been found to have elevated levels of lead in their blood since the water change. Gov. Rick Snyder's administration initially downplayed concerns but later committed funding to reconnect Flint to Detroit and to provide filters, testing and other services.

Ringler was already conducting an audit of Michigan's Office of Drinking Water and Municipal Assistance when the Flint corrosion issue arose. At the request of Senate Minority Leader Jim Ananich, he answered questions specific to Flint's lead contamination, including concerns that state regulators misled federal environmental regulators.

In February, a DEQ water supervisor told the EPA that Flint had a corrosion control program in place. But in April, an EPA official confirmed through another DEQ official that the city was not practicing corrosion treatment, according to emails. The EPA apparently interpreted the word "program" to mean treatment, while the DEQ meant it as testing to determine if corrosion controls would be needed in the future.

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA," Ringler wrote in a letter dated Wednesday and made public Monday.

The auditor concluded, however, that regardless of confusion over the federal rule, the state should have required Flint to start pursuing corrosion treatment in March after the first six months of testing showed too-high lead levels instead of waiting until August after a second six-month period. He also said the DEQ did not verify that Flint was correctly sampling water from houses only with lead pipes or lead service lines. He suggested that the department consider doing so.

"We agreed with the findings in the Auditor General's review," DEQ spokesman Brad Wurfel said. "The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues."

The Republican governor has come under scrutiny for the Flint fiasco. Spokesman Dave Murray said the letter "includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified. But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels."

Ananich, D-Flint, said "there are serious failings in our system that must be addressed" and again called for GOP leaders to schedule legislative hearings. They have rejected the requests, citing the work of a task force formed by Snyder.

The auditor's letter did not provide clarity on who specifically decided to use the Flint River for water. It was supposed to be an interim source until the city could join a new system getting water from Lake Huron.

Ringler noted that the city council voted in March 2013 to support moving to the Karegnondi Water Authority but was "silent" on using the river temporarily. Flint was being run by a Snyder-appointed manager until this past April and remains under some state oversight.

BREAKING: DEQ Director Resigns Over Flint Water Crisis (West Bloomfield Patch)

Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.

http://patch.com/michigan/westbloomfield/breaking-deq-director-resigns-over-flint-

water-crisis
West Bloomfield, MI

By BETH DALBEY (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.
DEQ Director Dan Wyant "has offered his resignation, and I've determined that it's appropriate to accept it," Snyder said in a statement.

The governor said he will be "making other personnel changes at MDEQ" as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency reliefto deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

State Delayed Action on Lead in Flint Water
The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

Opioid Addicts Younger Than Ever: Study

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.
The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to theWorld Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

"I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure," he wrote.

Changes in leadership and staff aren't enough, Snyder said. The statement continued:

"I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

"Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions," he wrote. "Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.

"These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

MDEQ Director Wyant resigns over Flint water crisis, Snyder apologizes (Michigan Radio)

UPDATED AT 5:37 PM ON 12/29/15

The head of the Michigan Department of Environmental Quality (MDEQ) has resigned over the drinking water crisis in Flint.

Gov. Rick Snyder has also now apologized to the community of Flint for his administration's involvement in the situation.

"I want the Flint community to know how very sorry I am that this has happened," said Snyder in a statement on Tuesday. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

MDEQ Director Dan Wyant will step down immediately. The resignation comes after Snyder received initial findings from the task force he appointed to investigate the situation. A number of reports have pointed to mistakes the department made that resulted in elevated lead levels in the city's water.

The governor says he plans to make additional personnel changes in the department – although he hasn't announced what those will be. And he says he'll meet with Flint Mayer Karen Weaver to discuss further actions the state could take to help the city.

Also resigning from the MDEQ today was spokesman Brad Wurfel.

Letter says the state department is at fault in Flint Water Crisis (WLNS News 6)

LANSING, MI. (WLNS) – At the state capital, a letter sent to Governor Snyder from his Flint Water Crisis task force says there's a state department to blame for the city's water problems.

In the letter the task force says the Department of Environmental Quality must be held accountable for failing to ensure the safe drinking water for people of Flint.

It says Flint residents were exposed to toxic levels of lead in their water because of a culture of passive compliance.

In addition to the letter, Dan Wyant stepped down as director of the department

> I think we need to reach out to TRMS to correct the repeated references to a "EPA whistleblower/rogue employee" that appear in this segment and previous segments. Our review of EPA actions in Flint show that the so-called whistleblower/rogue employee was acting under the direction of and with the support of EPA management when he tested water at three residences in Flint and prepared a report summarizing his findings. I personally objected to MDEQ management and the Governor's office when they called this R5 staffer a "rogue employee." This misrepresentation is especially problematic in the wake of the House Oversight hearing last summer, which focused on alleged whistleblowers in R5. I don't know if we need to ask for a formal correction, but we should at least ask TRMS to avoid this inaccurate characterization in future segments.

Paul Egan, Detroit Free Press9:07 p.m. EST December 29, 2015
http://www.freep.com/story/news/local/michigan/2015/12/29/deq-director-wyant-resigns-over-flint-water-crisis/78027052/

LANSING — Gov. Rick Snyder apologized to the City of Flint on Tuesday for the drinking water crisis that has left children poisoned by lead and announced that he accepted the resignation of Michigan Department of Environmental Quality Director Dan Wyant.

Snyder said in a news release that there will be other personnel changes at the DEQ and that the moves he announced are among "initial steps" he is taking to assure the safety of Flint residents, with more action to come.

“I want the Flint community to know how very sorry I am that this has happened," Snyder said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The governor, who previously stood by his DEQ director amid the controversy, said, "Dan Wyant has offered his resignation, and I’ve determined that it’s appropriate to accept it."

Before joining the Snyder administration as DEQ director, Wyant was president and chief operating officer of the Edward Lowe Foundation, which promotes entrepreneurship and helps business owners grow their companies. Before that, he served as director of the Michigan Department of Agriculture under Govs. John Engler and Jennifer Granholm.

Brad Wurfel, the DEQ public information officer who apologized after criticizing a researcher's reports of rising lead levels in the blood of Flint children as irresponsible, also resigned Tuesday, a spokesman for Snyder confirmed.

The governor said he acted based on interim findings of the Flint Water Advisory Task Force, which he appointed Oct. 21 to investigate the crisis and is continuing its work. He received a letter Tuesday morning that was highly critical of the DEQ.

The letter from the task force said the "primary responsibility" for what happened in Flint lies with the DEQ; the agency "failed in its responsibility" to ensure safe drinking water for Michigan residents and "must be held accountable for that failure." It was signed by task force members Matt Davis, Chris Kolb, Larry Reynolds, Eric Rothstein and Ken Sikkema.

The Free Press reported Thursday that records obtained by the Michigan ACLU and Virginia Tech researcher Marc Edwards show that elevated lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the DEQ to wrongly indicate the water was safe to drink.

Auditor General Doug Ringler said in a letter released Monday that it was appropriate for the DEQ to disqualify two samples with high lead levels that did not meet the sampling criteria. But the records obtained by the ACLU and Edwards also show that a DEQ official sent Flint an e-mail saying that samples as of late June showed Flint's water had lead levels above the "action level" that would require public notice and remedial action, and he hoped the city could send the remaining required samples quickly and that they would be below the action level for lead.

The records also suggest the DEQ was not as strict in disqualifying samples with low lead levels that did not meet the testing criteria as it was in disqualifying samples with high lead readings.

'It's ... not enough'

Flint, which was under the control of a state-appointed emergency manager at the time of the cost-cutting move, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

The state has acknowledged that it misinterpreted a federal rule and failed to require Flint to add needed corrosion-control chemicals that would have prevented lead from leaching into the drinking water from pipes, connections and fixtures.

That change in the drinking-water source brought immediate complaints from Flint residents about the taste, smell and appearance of the water. The lead tests of the water could have spurred action in July, but it was not until October — after blood test results analyzed by Hurley Children's Hospital pediatrician Dr. Mona Hanna-Attisha showed elevated lead levels in Flint children — that the DEQ admitted making a mistake by failing to require the addition of corrosion-control chemicals to the Flint River water. The state also then provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

Lead can cause irreversible brain damage in children and has also been linked to behavioral problems.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said she was more shocked by Snyder's apology than by Wyant's resignation. She welcomed the announcements but said more DEQ officials need to be removed because Flint residents can't trust those officials to make sure their water is safe to drink today.

"This all should have happened a long time ago, and it's also not enough," she said.

Mays questioned why Snyder has not endorsed Flint Mayor Karen Weaver's declaration of a state of emergency in Flint, which she said would help secure federal funding to help rectify problems.

Snyder spokesman Dave Murray said "no formal request has been made to the state" to declare a state of emergency in Flint.

"We are committed to working with Mayor Weaver and Genesee County leaders," and the emergency management division of the Michigan State Police is working with city and county officials on potential avenues for federal aid, Murray said.

The crisis has prompted a federal class-action and calls for an investigation by the U.S. Department of Justice.

Goals: Openness, trust

Snyder said "changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water."

Snyder said he wants to "share research on water and blood-lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

The other personnel changes at DEQ referenced by Snyder, aside from Wurfel's resignation, have not yet been made, Murray said.

“I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens.”

The letter from the task force said a minimalist culture of "technical compliance" had developed in the DEQ's Office of Drinking Water and Municipal Assistance and "it led to MDEQ's failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

The office "must adopt a posture that is driven not by this minimalist technical compliance approach, but rather by one that is founded on what needs to be done to assure drinking water safety," the letter said.

The letter also said that both the tone and substance of DEQ statements to the public during the crisis were "completely unacceptable," marked by a "persistent tone of scorn and derision."

Task force members met with Wyant, and while he agreed with many of the task force's interim conclusions, "it was disappointing to hear his weak defense of the (corrosion control) decision," the letter said.

Senate Minority Leader Jim Ananich, D-Flint, said the personnel changes Snyder announced could be a sign of progress if they "lead to a more aggressive response and resources to improve public health."

"I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again," Ananich said in a news release.

"Dan Wyant gets to walk away from this crisis, but the people of Flint do not," said Lonnie Scott, the group's executive director. "There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did

he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable."

Michigan's top environmental official resigned Tuesday after an independent task force delivered its initial findings on the Flint water contamination crisis — conclusions that also prompted an apology from Gov. Rick Snyder.
Dan Wyant, director of the Department of Environmental Quality since 2011, tendered his resignation Tuesday, marking the second agency shakeup in just over two months related to Flint's lead-tainted drinking water problems. The industrial city has been plagued by lead issues since an April 2014 switch to the Flint River as its water source.
A Snyder-appointed task force investigating the long-running situation announced it found Tuesday the DEQ "primarily responsible for failing to ensure safe drinking water in Flint." Snyder accepted the initial findings and Wyant's resignation — "I've determined that it's appropriate to accept it, he said — and then issued an apology.
"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a press release. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."
"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."
A Flint Water Advisory Task Force co-chair blamed the DEQ's passive culture for Flint's water ills.
"Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance that is simply insufficient to the task of public protection," wrote Ken Sikkema, a former state senator. "We also believe that the dismissive and disrespectful tone of much of the MDEQ's response to public concerns is unacceptable."
The water switch, made while Flint was under the leadership of a Snyder-appointed emergency manager, immediately led to resident complaints about the smell, taste and discoloration of their drinking water. Eventually, researchers found a link between the switch and a rise in lead poisoning among city children.
Lead poisoning can cause learning disabilities and, at high levels, may lead to seizures, coma and death, according to the Centers for Disease Control and Prevention.
Wyant could not be reached for comment Tuesday. In October, Wyant

admitted the DEQ erred in its application of the federal Lead and Copper Rule, designed to ensure safe drinking water for residents.

Late on Tuesday, DEQ spokesman Brad Wurfel resigned as well.

Flint was allowed to begin drawing its drinking water from the river without any corrosion controls in place to prevent lead in old plumbing connections from leaching. The task force said the DEQ failed in the regulatory handling of Flint's water problems, the "substance and tone" in the department's response as well as its "interpretation of the Lead and Copper Rule."

State Sen. Jim Ananich, D-Flint, criticized the DEQ culture Tuesday, saying workers were more concerned with following rules than informing the public about potential problems.

"When you have lead in the water, I don't care if you follow the rules or not: You need to notify the public first," Ananich said.

Critics have put increasing pressure on Snyder's administration to answer for the Flint water decisions in the last two years. Among the harshest critics is Marc Edwards, a Virginia Tech researcher whose water sampling at Flint homes and public record requests have helped keep the spotlight on the state government's actions.

But Edwards said Wyant should not be the one on the chopping block.

"I'm glad that someone is sorry and someone is being held accountable," Edwards said. "But Dan Wyant would not be at the top of my list — or even on the list. I feel strongly he was misled by his staff at every point, and he was put in publicly embarrassing situations by the staff's misinformation."

Dr. Mona Hanna-Attisha, a Hurley Medical Center pediatrician who uncovered lead exposure in city children following the switch, echoed Edwards by saying DEQ staffers' mistakes led to Flint's problems.

"(Wyant) wasn't directly involved," she said. "There are other people, particularly in (the Office of Drinking Water and Municipal Assistance), that need to take some responsibility. ... (Wyant) was a nice person being fed bad information."

In 2013, Flint agreed to create a new regional water authority in an attempt to save money. The city had tried to negotiate lower rates with former provider Detroit Water and Sewerage Department for years, to little avail.

But the Karegondi Water Authority will not be completed until some time next year. In the interim, Flint looked to its river to provide drinking water. That water turned out to be far more corrosive than the Lake Huron water used by the Detroit system.

With pressure mounting from troublesome water samples and health studies, Flint reconnected to the Detroit system in October.

Snyder previously was elusive in acknowledging the extent of the state's responsibility for the lead contamination of the city's water when it switched to the more corrosive Flint River in 2014, saying he was awaiting the task force report. On Tuesday, the governor was more contrite.

"We've already allocated $10 million to test the water, distribute water filters, and help in other ways," Snyder said. "Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Michigan Regulator Resigns Amid Flint's Lead-in-Water Crisis (AP)
By DAVID EGGERT, ASSOCIATED PRESS
LANSING, Mich. — Dec 29, 2015, 7:16 PM ET
http://abcnews.go.com/Politics/wireStory/michigan-official-resigns-amid-flint-water-issue-35996502

Michigan's top environmental regulator resigned Tuesday after elevated levels of lead were found in Flint children during a drinking water crisis that a task force blamed primarily on his agency.

Gov. Rick Snyder accepted the resignation of Department of Environmental Quality Director Dan Wyant and apologized for what occurred in Flint, which switched its drinking water supply in a cost-cutting move while under state financial management. Communications director Brad Wurfel also resigned, and Snyder said he plans additional personnel changes in the agency.

Wyant quit the same day a task force appointed by the Republican governor reported that the department was primarily responsible for the fiasco because it did not require Flint to keep corrosive water from leaching lead from service pipes into residents' homes and belittled concerns from the public. Exposure to lead can cause behavior problems and learning disabilities in children.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a written statement. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The five-member task force, which previously brought up concerns about a lack of organization in responding to the disaster, said the environmental department's Office of Drinking Water and Municipal Assistance has a "minimalist approach" to regulatory oversight in which "technical compliance" is sufficient. It faulted the agency for a "tone of scorn and derision" toward the public, including outside water and health experts who raised alarm bells.

The task force confirmed that the state did not follow the federal Lead and Copper Rule when Flint disconnected from Detroit's water system in April 2014 and switched to Flint River water while waiting to connect to a new regional water authority.

Detroit's water from Lake Huron had been treated for corrosion. State officials thought that after Flint made the transition to the river it could test the new water for lead over two six-month intervals to determine potential corrosion treatment instead of needing to immediately add corrosion controls. Flint returned to Detroit's water in October after a public health emergency was declared.

The task force, which met with Wyant on Dec. 16, noted his substantial agreement with many of its conclusions but expressed disappointment with his "weak defense" regarding the federal rule.

The U.S. Environmental Protection Agency said in a November memo that there are "differing possible interpretations" of the Lead and Copper Rule, explaining that it does not explicitly discuss a scenario like in Flint.

But task force members said, "Individuals and agencies responsible must be held accountable in a timely fashion."
They also cited recent revelations of the Department of Health and Human Services' apparent early knowledge of and silence about elevated blood-lead levels, and said the committee's final report in early 2016 would review local governments' decision processes while under emergency management.
"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust," Snyder said.
Wyant, 56, led the Environmental Quality Department for nearly five years. He previously served as the state's agricultural director under Republican Gov. John Engler and Democratic Gov. Jennifer Granholm.
"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress," said Senate Minority Leader Jim Ananich, a Democrat from Flint.

Task force lays most blame for Flint water crisis on MDEQ (Michigan Radio)

By VINCENT DUFFY • 14 HOURS AGO

http://michiganradio.org/post/task-force-lays-most-blame-flint-water-crisis-mdeq#stream/0
MDEQ Director Dan Wyant at a recent press conference.
CREDIT SCREEN GRAB / MLIVE USTREAM
A task force appointed by Gov. Rick Snyder says Michigan's environmental regulatory agency is primarily responsible for the state's failure to ensure safe drinking water for Flint residents.

The Flint Water Advisory Task Force says in a letter to Snyder that the state Department of Environmental Quality "must be held accountable for that failure."

The letter was made public Tuesday. You can read it here.

Corrosive Flint River water leached lead from service pipes into homes after the city switched last year from Detroit water. Elevated blood-lead levels later were found in some children.

Department of Environmental Quality Director Dan Wyant and spokesman Brad Wurfel both resigned Tuesday.

Task force co-chair Ken Sikkema says in the letter that "Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance."

The FWATF letter stated in part:

“We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ). Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure.”

“The City of Flint’s water customers—fellow Michigan citizens—were needlessly and tragically exposed to toxic levels of lead through their drinking water supply. They deserve a commitment to properly assess responsibility and ensure accountability. They also deserve a commitment to needed mitigation in both the short and long term. The Flint water crisis never should have happened. Having failed to prevent it, state government should coordinate a sustained, public-health-focused response to remedy, to the fullest extent possible, the impacts on the Flint community.”

The letter outlined three areas where MDEQ failed:

Regulatory Failure
Failure in Substance and Tone of MDEQ Response to the Public
Failure in MDEQ Interpretation of the Lead and Copper Rule
This is the second letter sent by the Task Force. The first, sent earlier this month, made several recommendations concerning coordination of state efforts that were supported and implemented by Governor Snyder.

The full FWATF report is expected to be completed in early 2016.

Members of the Task Force include:

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan.

Chris Kolb is president of the Michigan Environmental Council.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children’s Health Center.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority.

Ken Sikkema is a senior policy fellow at Public Sector Consultants. (Full Disclosure - he is also a regular commenter on Michigan Radio.)

The FWATF was formed by Governor Snyder to review actions regarding the Flint water system and offer recommendations both for Flint and Michigan to protect the health and safety of state residents.

Flint water scandal: Snyder apologizes, DEQ director resigns (Fox 2 Detroit)

Gov. Rick Snyder announced changes at the Michigan DEQ.
http://www.fox2detroit.com/news/local-news/66000998-story

POSTED:DEC 29 2015 10:25PM EST
UPDATED:DEC 29 2015 11:24PM EST
FLINT, Mich. - Gov. Rick Snyder says he's sorry for Flint's water crisis as one of his top appointees resigns.
The director of the state's department of environmental quality Dan Wyant resigned.

Wyant was in charge of keeping the water safe. When Flint switched its drinking water source from Lake Huron water supplied by detroit...to the flint river - to save money -- corrosion flowed through the pipes.

Score Big & Save on VIZIO Ultra HDTVsVizio
Tests showed elevated levels of lead in the city's drinking water back in June. But the state didn't take action until October after blood testing showed high lead levels in Flint's children.
Flint water scandal: Snyder apologizes, DEQ director resigns
Snyder's office issued a press release Tuesday:
"I want the Flint community to know how very sorry I am that this has happened," he said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.
"When I became aware that the city of Flint's water showed elevated lead levels and that the state's handling of the situation was being questioned," he said. "I requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible missteps and areas for improvement.
"The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials … We'll continue to work with the community members to make sure we hear and respond to their concerns.
"MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at

MDEQ to address problems cited by the task force."

In a previous FOX 2 report it was discovered a year after the city began using the Flint River as its water source; a local hospital's study found the number of Flint kids under the age of 5 years old with above average lead levels nearly doubled city-wide and in some cases, tripled.

Virginia Tech University tested resident Ronda Thornton's water. Anything more than 30 micrograms a liter is a sign of serious lead contamination. Hers registered 138.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

"But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

Director Dan Wyant resigns after task force blasts MDEQ over Flint water crisis

All Stories

FLINT, MI – Mayor Karen Weaver and other local leaders say the resignation of Michigan Department of Environmental Quality Director Dan Wyant and release of Flint Water Task Force findings Tuesday are the first steps toward holding people accountable for Flint's water crisis.

"There is some accountability being put in place and that's a good thing," Weaver said. "That's what is happening and I think that's a good sign because it shows that our voices have been heard and that they will continue to be heard."

According to a statement issued by Gov. Rick Snyder on Dec. 29, he has accepted Wyant's resignation after findings from a report by the task force, which was created by Snyder in October to look into Flint's water crisis. In the same statement, Snyder also said he was "sorry" to the Flint community for the water issues.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust ... Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Weaver confirmed that she will be meeting with Snyder after the first of the year.

"I hope this will help move Flint forward," she said. "One thing that has been an issue for us here in Flint has been that broken trust. We will have a new person that we will be working with, and that's a positive step."

The task force report, which is preliminary, revealed that the MDEQ failed the city in multiple areas including regulatory failures, substance and tone of the MDEQ's response to public and the interpretation of the federal lead and copper rule.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," said the preliminary report. "Although many individuals and entities at state and local levels contributed to creating a prolonging problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable."

State Rep. Sheldon Neeley, D-Flint, said that he and others in the city have called for legislative hearings regarding the water crisis and that Wyant's departure is just the first, not the only, person held responsible for the condition of Flint's water.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or have Gov. Rick Snyder do the deed for him," Neeley said in a statement issued Dec. 29. "There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders."

Neeley, who along with Sen. Jim Ananich, D-Flint, have been pushing for legislative hearings on Flint's water crisis, went on to say there is still "cleanup do be done" and he is "glad" that Wyant has stepped down in what Neeley considers a "disorganized and flawed DEQ."

The task force's report also says members spoke with Wyant on Dec. 16 and they were not pleased with how he responded to the city's water crisis and he was in agreement with some of their findings.

"It is our understanding that he has drawn similar conclusions in his own evaluation of MDEQ's role in the Flint water crisis," said the report. "At the same time, it was disappointing to hear his weak defense of the CCT (corrosion control treatment) decision based on the EPA's November 2015 memorandum."

Both Ananich and Neeley's push led to an independent review by the Office of State Auditor Genera,l which made it clear in a Dec. 23 letter that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water. The review was based on a series of questions sent to the auditor from Ananich in October.

The corrosiveness of Flint River water is blamed for lead that leached from pipes into drinking water, causing elevated levels of lead in the blood of Flint children.

"I think the best apology (Snyder) can offer the residents of Flint and the rest of the state is a promise that this will never happen again," Ananich said. "The proof is in the long-term commitment. I'm going to continue to work to make sure that we get that."

Michigan Gov. Rick Snyder apologizes for lead levels in Flint water (Detroit 4)

DEQ head Dan Wyant's resigns after task force blames department for crisis

By Jason Colthorp – Reporter
http://www.clickondetroit.com/news/michigan-official-resigns-amid-flint-water-issue

LANSING, Mich. - Gov. Rick Snyder issued an apology Tuesday as Dan Wyant, his head of the Department of Environmental Quality, resigned after a task force lead by the state's auditor general blasted the DEQ for it's role in Flint's water crisis.

The state's mishandling of Flint's water system ultimately exposed Flint residents to dangerously elevated levels of lead.

“I want the Flint community to know how very sorry I am that this has happened,” Snyder said in a statement. “And I want all Michigan citizens to know that we will learn from this experience.”

The governor's apology and the DEQ head's resignation has helped to temper concerns that no one cared about Flint said the city's mayor Karen Weaver.

“One of the things we've always talked about is accountability and that seems to be what's happening,” said Weaver. “It also let us know here in Flint that our voice is being heard.”

Snyder's apology and Wyant's resignation come after the task force released their finding that the DEQ was primarily at fault for Flint's unhealthy level of lead in their drinking water.

“Although many contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan,” the task force said in a written statement. “It failed in that responsibility."

For many Flint residents like Kim Peterson, Tuesday's announcements do little to help them feel confident about the safety of their drinking water. Peterson says she is still hesitant to drink the water even though it is again coming from a healthy source in Lake Huron.

"I take it to mean that something was really wrong with this whole system of checks and balances," she said.

"You don't trust it because you've heard so many conflicting things from so many different people, so we still continue to buy the water."

Mayor Weaver, however, believes Snyder's apology is a first step toward rebuilding trust: "This is a good step to get some things started because people had lost faith and they had lost trust."

Snyder has promised more steps will be taken after the task force releases its final and full report.

on December 29, 2015 at 4:39 PM, updated December 29, 2015 at 6:51 PM
LANSING, MI -- Gov. Rick Snyder on Tuesday accepted a resignation from Michigan Department of Environmental Quality Director Dan Wyant after a task force laid responsibility for the Flint water crisis at the feet of the department.
Snyder, in a statement, announced Wyant's resignation and apologized to Flint residents after he received a letter from the Flint Water Advisory Task Force.
"...MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force," Snyder said.
Wyant and the DEQ have come under fire in recent months for handling a Flint drinking water crisis that lead to corrosive water running through city pipes and resulted in children with elevated levels of lead. In October, Wyant acknowledgeda mistake in oversight from his office, saying DEQ officials were confused about federal regulations on making the drinking water less corrosive.
The task force in its letter blamed the department for the crisis.
"We believe the primary responsibility for what happened in Flint rests with the

Michigan Department of Environmental Quality (MDEQ)," read the letter to Snyder.

"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure."

The task force cited DEQ's involvement as regulatory failure, failure in substance and tone of response to the public and a failure of interpreting the lead and copper rule.

Gov. Rick Snyder recently named the Flint water crisis as his biggest disappointment in 2015.

Wyant had a long track record of service for the state. He served as director of the Michigan Department of Agriculture under both Democratic Gov. Jennifer Granholm and Republican Gov. John Engler before Gov. Rick Snyder tapped him to head up the DEQ in 2011.

He shepherded the department through a transition into being its own entity again after Gov. Jennifer Granholm had combined it with the Department of Natural Resources, forming the Department of Natural Resources and Environment. He also led the "quality of life group" within state government, meaning he coordinated efforts between the DNR, DEQ and Department of Agriculture and Rural Development.

The statement from Snyder alluded to other structural changes within the DEQ, and spokesperson Dave Murray said those decisions would be made in the coming days. DEQ spokesperson Brad Wurfel did not immediately return a call for comment.

Wyant's resignation met with mixed reaction from political groups and leaders.

Senate Minority Leader Jim Ananich (D-Flint) released the following statement:

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress. I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again."

Attorney General Bill Schuette praised Wyant's service to the state.

"I am saddened to hear of the resignation of Department of Environment Quality Director Dan Wyant. In my 20-plus years of knowing him, Dan has been a hardworking, dedicated public servant. I am committed to working with all parties, including the legislature and Governor, to ensure the public's health and the well being of Michigan residents."

Democratic Congressman Dan Kildee, who represents Flint, said the steps taken today were appropriate but encouraged further action.

"Governor Snyder's apology over the Flint water crisis is appropriate, as are personnel changes announced today at the Department of Environmental Quality," Kildee said.

"Through this ongoing crisis, the people of Flint did nothing wrong – they are victims of this failure of government. The State of Michigan must not only acknowledge its role in this crisis, but also take responsibility and act right away to make it right."

He urged the state to establish a fund to ensure that kids receive developmental, nutritional and educational resources to help overcome the effects of their lead exposure.

Rep. Sheldon Neeley, D-Flint, said Wyant was not the only offender.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or to have Gov. Rick Snyder do the deed for him. There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders," Neeley said.

"While there is still much cleanup to be done, I am glad Mr. Wyant realized he could no longer continue as the head of the disorganized and flawed DEQ, and I call on Gov. Snyder to take careful effort in repairing this department so that it earns back the trust of the people of Flint and this great state.

Progress Michigan said there had been a lack of accountability for the Flint water crisis.

"So far under Gov. Rick Snyder's watch, there has been zero accountability in this crisis and that continues today," said Lonnie Scott, executive director of Progress Michigan.

"Dan Wyant gets to walk away from this criss, but the people of Flint do not. There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable. All documentation related this this crisis needs to be released to the public immediately."

Auditor: State erred on Flint water but didn't mislead feds (AP/Crain's Detroit)

http://www.crainsdetroit.com/article/20151228/NEWS01/151229867/auditor-state-erred-on-flint-water-but-didnt-mislead-feds By David Eggert
Associated Press

Michigan Department of Environmental Quality Environment More +

LANSING — The director of Michigan's Department of Environmental Quality has resigned after the Flint Water Task Force delivered its findings on the the city's water contamination crisis to Gov. Rick Snyder.

Snyder said Tuesday afternoon in a statement that he accepted the resignation of Dan Wyant and plans to make "other personnel changes at MDEQ to address problems cited by the task force.

"But changes in leadership and staff are not enough."

In a preliminary report released Monday, Michigan's auditor general said state regulators should have required Flint to treat its corrosive drinking water to keep lead from leaching from service lines into people's homes but did not purposely mislead federal officials about the lack of corrosion control.

Doug Ringler, citing a memo issued last month by the U.S. Environmental Protection Agency, concluded that the Michigan Department of Environmental

Quality erred in not requiring the city to immediately combat corrosion when it switched from Detroit's system to the Flint River in April 2014 in a cost-cutting move while under state financial management. State officials interpreted federal rules to mean Flint could make the transition and then test the new water for lead over two six-month intervals to determine potential corrosion treatment.

Flint children have been found to have elevated levels of lead in their blood since the water change. Gov. Rick Snyder's administration initially downplayed concerns but later committed funding to reconnect Flint to Detroit and to provide filters, testing and other services.

Ringler was already conducting an audit of Michigan's Office of Drinking Water and Municipal Assistance when the Flint corrosion issue arose. At the request of Senate Minority Leader Jim Ananich, he answered questions specific to Flint's lead contamination, including concerns that state regulators misled federal environmental regulators.

In February, a DEQ water supervisor told the EPA that Flint had a corrosion control program in place. But in April, an EPA official confirmed through another DEQ official that the city was not practicing corrosion treatment, according to emails.

The EPA apparently interpreted the word "program" to mean treatment, while the DEQ meant it as testing to determine if corrosion controls would be needed in the future.

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA," Ringler wrote in a letter dated Wednesday and made public Monday.

The auditor concluded, however, that regardless of confusion over the federal rule, the state should have required Flint to start pursuing corrosion treatment in March after the first six months of testing showed too-high lead levels instead of waiting until August after a second six-month period. He also said the DEQ did not verify that Flint was correctly sampling water from houses only with lead pipes or lead service lines. He suggested that the department consider doing so.

"We agreed with the findings in the Auditor General's review," DEQ spokesman Brad Wurfel said. "The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues."

The Republican governor has come under scrutiny for the Flint fiasco. Spokesman Dave Murray said the letter "includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified. But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels."

Ananich, D-Flint, said "there are serious failings in our system that must be addressed" and again called for GOP leaders to schedule legislative hearings. They have rejected the requests, citing the work of a task force formed by Snyder.

The auditor's letter did not provide clarity on who specifically decided to use the

Flint River for water. It was supposed to be an interim source until the city could join a new system getting water from Lake Huron.
Ringler noted that the city council voted in March 2013 to support moving to the Karegnondi Water Authority but was "silent" on using the river temporarily. Flint was being run by a Snyder-appointed manager until this past April and remains under some state oversight.

BREAKING: DEQ Director Resigns Over Flint Water Crisis (West Bloomfield Patch)
Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.
http://patch.com/michigan/westbloomfield/breaking-deq-director-resigns-over-flint-water-crisis
West Bloomfield, MI

By BETH DALBEY (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.
DEQ Director Dan Wyant "has offered his resignation, and I've determined that it's appropriate to accept it," Snyder said in a statement.

The governor said he will be "making other personnel changes at MDEQ" as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency reliefto deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

State Delayed Action on Lead in Flint Water
The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

Opioid Addicts Younger Than Ever: Study

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.
The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to theWorld Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

"I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure," he wrote.

Changes in leadership and staff aren't enough, Snyder said. The statement continued:

"I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

"Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions," he wrote. "Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term.

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

MDEQ Director Wyant resigns over Flint water crisis, Snyder apologizes (Michigan Radio)

Former MDEQ director Dan Wyant
CREDIT STEVE CARMODY / MICHIGAN RADIO
UPDATED AT 5:37 PM ON 12/29/15

The head of the Michigan Department of Environmental Quality (MDEQ) has resigned over the drinking water crisis in Flint.

Gov. Rick Snyder has also now apologized to the community of Flint for his administration’s involvement in the situation.

“I want the Flint community to know how very sorry I am that this has happened,” said Snyder in a statement on Tuesday. “And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.”

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust.”

MDEQ Director Dan Wyant will step down immediately. The resignation comes after Snyder received initial findings from the task force he appointed to investigate the situation. A number of reports have pointed to mistakes the department made that resulted in elevated lead levels in the city’s water.

The governor says he plans to make additional personnel changes in the department – although he hasn’t announced what those will be. And he says he’ll meet with Flint Mayer Karen Weaver to discuss further actions the state could take to help the city.

Also resigning from the MDEQ today was spokesman Brad Wurfel.

Letter says the state department is at fault in Flint Water Crisis (WLNS News 6)

LANSING, MI. (WLNS) – At the state capital, a letter sent to Governor Snyder from his Flint Water Crisis task force says there's a state department to blame for the city's water problems.

In the letter the task force says the Department of Environmental Quality must be held accountable for failing to ensure the safe drinking water for people of Flint.

It says Flint residents were exposed to toxic levels of lead in their water because of a culture of passive compliance.

In addition to the letter, Dan Wyant stepped down as director of the department

I think we need to reach out to TRMS to correct the repeated references to a "EPA whistleblower/rogue employee" that appear in this segment and previous segments. Our review of EPA actions in Flint show that the so-called whistleblower/rogue employee was acting under the direction of and with the support of EPA management when he tested water at three residences in Flint and prepared a report summarizing his findings. I personally objected to MDEQ management and the Governor's office when they called this R5 staffer a "rogue employee." This misrepresentation is especially problematic in the wake of the House Oversight hearing last summer, which focused on alleged whistleblowers in R5. I don't know if we need to ask for a formal correction, but we should at least ask TRMS to avoid this inaccurate characterization in future segments.

I am happy to talk about this if you would like us to set up a call.

http://www.freep.com/story/news/local/michigan/2015/12/29/deq-director-wyant-resigns-over-flint-water-crisis/78027052/

LANSING — Gov. Rick Snyder apologized to the City of Flint on Tuesday for the drinking water crisis that has left children poisoned by lead and announced that he accepted the resignation of Michigan Department of Environmental Quality Director Dan Wyant.

Snyder said in a news release that there will be other personnel changes at the DEQ and that the moves he announced are among "initial steps" he is taking to assure the safety of Flint residents, with more action to come.

“I want the Flint community to know how very sorry I am that this has happened," Snyder said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The governor, who previously stood by his DEQ director amid the controversy, said, "Dan Wyant has offered his resignation, and I’ve determined that it’s appropriate to accept it."

Before joining the Snyder administration as DEQ director, Wyant was president and chief operating officer of the Edward Lowe Foundation, which promotes entrepreneurship and helps business owners grow their companies. Before that, he served as director of the Michigan Department of Agriculture under Govs. John Engler and Jennifer Granholm.

Brad Wurfel, the DEQ public information officer who apologized after criticizing a researcher's reports of rising lead levels in the blood of Flint children as irresponsible, also resigned Tuesday, a spokesman for Snyder confirmed.

The governor said he acted based on interim findings of the Flint Water Advisory Task Force, which he appointed Oct. 21 to investigate the crisis and is continuing its work. He received a letter Tuesday morning that was highly critical of the DEQ.

The letter from the task force said the "primary responsibility" for what happened in Flint lies with the DEQ; the agency "failed in its responsibility" to ensure safe drinking water for Michigan residents and "must be held accountable for that failure." It was signed by task force members Matt Davis, Chris Kolb, Larry Reynolds, Eric Rothstein and Ken Sikkema.

The Free Press reported Thursday that records obtained by the Michigan ACLU and Virginia Tech researcher Marc Edwards show that elevated lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the DEQ to wrongly indicate the water was safe to drink.

Auditor General Doug Ringler said in a letter released Monday that it was appropriate for the DEQ to disqualify two samples with high lead levels that did not meet the sampling criteria. But the records obtained by the ACLU and Edwards also show that a DEQ official sent Flint an e-mail saying that samples as of late June showed Flint's water had lead levels above the "action level" that would require public notice and remedial action, and he hoped the city could send the remaining required samples quickly and that they would be below the action level for lead.

The records also suggest the DEQ was not as strict in disqualifying samples with low lead levels that did not meet the testing criteria as it was in disqualifying samples with high lead readings.

'It's ... not enough'

Flint, which was under the control of a state-appointed emergency manager at the time of the cost-cutting move, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

The state has acknowledged that it misinterpreted a federal rule and failed to require Flint to add needed corrosion-control chemicals that would have prevented lead from leaching into the drinking water from pipes, connections and fixtures.

That change in the drinking-water source brought immediate complaints from Flint residents about the taste, smell and appearance of the water. The lead tests of the water could have spurred action in July, but it was not until October — after blood test results analyzed by Hurley Children's Hospital pediatrician Dr. Mona Hanna-Attisha showed elevated lead levels in Flint children — that the DEQ admitted making a mistake by failing to require the addition of corrosion-control chemicals to the Flint River water. The state also then provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

Lead can cause irreversible brain damage in children and has also been linked to behavioral problems.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said she was more shocked by Snyder's apology than by Wyant's resignation. She welcomed the announcements but said more DEQ officials need to be removed because Flint residents can't trust those officials to make sure their water is safe to drink today.

"This all should have happened a long time ago, and it's also not enough," she said.

Mays questioned why Snyder has not endorsed Flint Mayor Karen Weaver's declaration of a state of emergency in Flint, which she said would help secure federal funding to help rectify problems.

Snyder spokesman Dave Murray said "no formal request has been made to the state" to declare a state of emergency in Flint.

"We are committed to working with Mayor Weaver and Genesee County leaders," and the emergency management division of the Michigan State Police is working with city and county officials on potential avenues for federal aid, Murray said.

The crisis has prompted a federal class-action and calls for an investigation by the U.S. Department of Justice.

Goals: Openness, trust

Snyder said "changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water."

Snyder said he wants to "share research on water and blood-lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

The other personnel changes at DEQ referenced by Snyder, aside from Wurfel's resignation, have not yet been made, Murray said.

“I know many Flint citizens are angry and want more than an apology," Snyder said. "That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

The letter from the task force said a minimalist culture of "technical compliance" had developed in the DEQ's Office of Drinking Water and Municipal Assistance and "it led to MDEQ's failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

The office "must adopt a posture that is driven not by this minimalist technical compliance approach, but rather by one that is founded on what needs to be done to assure drinking water safety," the letter said.

The letter also said that both the tone and substance of DEQ statements to the public during the crisis were "completely unacceptable," marked by a "persistent tone of scorn and derision."

Task force members met with Wyant, and while he agreed with many of the task force's interim conclusions, "it was disappointing to hear his weak defense of the (corrosion control) decision," the letter said.

Senate Minority Leader Jim Ananich, D-Flint, said the personnel changes Snyder announced could be a sign of progress if they "lead to a more aggressive response and resources to improve public health."

"I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again," Ananich said in a news release.

"Dan Wyant gets to walk away from this crisis, but the people of Flint do not," said Lonnie Scott, the group's executive director. "There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable."

Michigan's top environmental official resigned Tuesday after an independent task force delivered its initial findings on the Flint water contamination crisis — conclusions that also prompted an apology from Gov. Rick Snyder.

Dan Wyant, director of the Department of Environmental Quality since 2011, tendered his resignation Tuesday, marking the second agency shakeup in just over two months related to Flint's lead-tainted drinking water problems. The industrial city has been plagued by lead issues since an April 2014 switch to the Flint River as its water source.

A Snyder-appointed task force investigating the long-running situation announced it found Tuesday the DEQ "primarily responsible for failing to ensure safe drinking water in Flint." Snyder accepted the initial findings and Wyant's resignation — "I've determined that it's appropriate to accept it, he said — and then issued an apology.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a press release. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

A Flint Water Advisory Task Force co-chair blamed the DEQ's passive culture for Flint's water ills.

"Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance that is simply insufficient to the task of public protection," wrote Ken Sikkema, a former state senator. "We also believe that the dismissive and disrespectful tone of much of the MDEQ's response to public concerns is unacceptable."

The water switch, made while Flint was under the leadership of a Snyder-appointed emergency manager, immediately led to resident complaints about the smell, taste and discoloration of their drinking water. Eventually, researchers found a link between the switch and a rise in lead poisoning among city children.

Lead poisoning can cause learning disabilities and, at high levels, may lead to seizures, coma and death, according to the Centers for Disease Control and Prevention.

Wyant could not be reached for comment Tuesday. In October, Wyant admitted the DEQ erred in its application of the federal Lead and Copper Rule, designed to ensure safe drinking water for residents.

Late on Tuesday, DEQ spokesman Brad Wurfel resigned as well.

Flint was allowed to begin drawing its drinking water from the river without any corrosion controls in place to prevent lead in old plumbing connections from leaching. The task force said the DEQ failed in the regulatory handling of Flint's water problems, the "substance and tone" in the department's response as well as its "interpretation of the Lead and Copper Rule."

State Sen. Jim Ananich, D-Flint, criticized the DEQ culture Tuesday, saying workers were more concerned with following rules than informing the public about potential problems.

"When you have lead in the water, I don't care if you follow the rules or not: You need to notify the public first," Ananich said.

Critics have put increasing pressure on Snyder's administration to answer for the

Flint water decisions in the last two years. Among the harshest critics is Marc Edwards, a Virginia Tech researcher whose water sampling at Flint homes and public record requests have helped keep the spotlight on the state government's actions.

But Edwards said Wyant should not be the one on the chopping block.

"I'm glad that someone is sorry and someone is being held accountable," Edwards said. "But Dan Wyant would not be at the top of my list — or even on the list. I feel strongly he was misled by his staff at every point, and he was put in publicly embarrassing situations by the staff's misinformation."

Dr. Mona Hanna-Attisha, a Hurley Medical Center pediatrician who uncovered lead exposure in city children following the switch, echoed Edwards by saying DEQ staffers' mistakes led to Flint's problems.

"(Wyant) wasn't directly involved," she said. "There are other people, particularly in (the Office of Drinking Water and Municipal Assistance), that need to take some responsibility. ... (Wyant) was a nice person being fed bad information."

In 2013, Flint agreed to create a new regional water authority in an attempt to save money. The city had tried to negotiate lower rates with former provider Detroit Water and Sewerage Department for years, to little avail.

But the Karegondi Water Authority will not be completed until some time next year. In the interim, Flint looked to its river to provide drinking water. That water turned out to be far more corrosive than the Lake Huron water used by the Detroit system. With pressure mounting from troublesome water samples and health studies, Flint reconnected to the Detroit system in October.

Snyder previously was elusive in acknowledging the extent of the state's responsibility for the lead contamination of the city's water when it switched to the more corrosive Flint River in 2014, saying he was awaiting the task force report. On Tuesday, the governor was more contrite.

"We've already allocated $10 million to test the water, distribute water filters, and help in other ways," Snyder said. "Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Michigan Regulator Resigns Amid Flint's Lead-in-Water Crisis (AP)

By DAVID EGGERT, ASSOCIATED PRESS
LANSING, Mich. — Dec 29, 2015, 7:16 PM ET
http://abcnews.go.com/Politics/wireStory/michigan-official-resigns-amid-flint-water-issue-35996502

Michigan's top environmental regulator resigned Tuesday after elevated levels of lead were found in Flint children during a drinking water crisis that a task force blamed primarily on his agency.

Gov. Rick Snyder accepted the resignation of Department of Environmental Quality Director Dan Wyant and apologized for what occurred in Flint, which switched its drinking water supply in a cost-cutting move while under state financial management. Communications director Brad Wurfel also resigned, and Snyder said he plans additional personnel changes in the agency.

Wyant quit the same day a task force appointed by the Republican governor reported that the department was primarily responsible for the fiasco because it did not require Flint to keep corrosive water from leaching lead from service pipes into residents' homes and belittled concerns from the public. Exposure to lead can cause behavior problems and learning disabilities in children.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a written statement. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The five-member task force, which previously brought up concerns about a lack of organization in responding to the disaster, said the environmental department's Office of Drinking Water and Municipal Assistance has a "minimalist approach" to regulatory oversight in which "technical compliance" is sufficient. It faulted the agency for a "tone of scorn and derision" toward the public, including outside water and health experts who raised alarm bells.

The task force confirmed that the state did not follow the federal Lead and Copper Rule when Flint disconnected from Detroit's water system in April 2014 and switched to Flint River water while waiting to connect to a new regional water authority.

Detroit's water from Lake Huron had been treated for corrosion. State officials thought that after Flint made the transition to the river it could test the new water for lead over two six-month intervals to determine potential corrosion treatment instead of needing to immediately add corrosion controls. Flint returned to Detroit's water in October after a public health emergency was declared.

The task force, which met with Wyant on Dec. 16, noted his substantial agreement with many of its conclusions but expressed disappointment with his "weak defense" regarding the federal rule.

The U.S. Environmental Protection Agency said in a November memo that there are "differing possible interpretations" of the Lead and Copper Rule, explaining that it does not explicitly discuss a scenario like in Flint.

But task force members said, "Individuals and agencies responsible must be held accountable in a timely fashion."

They also cited recent revelations of the Department of Health and Human Services' apparent early knowledge of and silence about elevated blood-lead levels, and said the committee's final report in early 2016 would review local governments' decision processes while under emergency management.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust," Snyder said.

Wyant, 56, led the Environmental Quality Department for nearly five years. He previously served as the state's agricultural director under Republican Gov. John Engler and Democratic Gov. Jennifer Granholm.

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress," said Senate Minority Leader Jim Ananich, a Democrat from Flint.

Task force lays most blame for Flint water crisis on MDEQ (Michigan Radio)
By VINCENT DUFFY • 14 HOURS AGO
SHARETwitter Facebook Google+ Email
http://michiganradio.org/post/task-force-lays-most-blame-flint-water-crisis-mdeq#stream/0
MDEQ Director Dan Wyant at a recent press conference.
CREDIT SCREEN GRAB / MLIVE USTREAM
A task force appointed by Gov. Rick Snyder says Michigan's environmental regulatory agency is primarily responsible for the state's failure to ensure safe drinking water for Flint residents.

The Flint Water Advisory Task Force says in a letter to Snyder that the state Department of Environmental Quality "must be held accountable for that failure."

The letter was made public Tuesday. You can read it here.

Corrosive Flint River water leached lead from service pipes into homes after the city switched last year from Detroit water. Elevated blood-lead levels later were found in some children.

Department of Environmental Quality Director Dan Wyant and spokesman Brad Wurfel both resigned Tuesday.

Task force co-chair Ken Sikkema says in the letter that "Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance."

The FWATF letter stated in part:

“We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ). Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure.”

“The City of Flint’s water customers—fellow Michigan citizens—were needlessly and tragically exposed to toxic levels of lead through their drinking water supply. They deserve a commitment to properly assess responsibility and ensure accountability. They also deserve a commitment to needed mitigation in both the short and long term. The Flint water crisis never should have happened. Having failed to prevent it, state government should coordinate a sustained, public-health-focused response to remedy, to the fullest extent possible, the impacts on the Flint community.”

The letter outlined three areas where MDEQ failed:

Regulatory Failure
Failure in Substance and Tone of MDEQ Response to the Public
Failure in MDEQ Interpretation of the Lead and Copper Rule
This is the second letter sent by the Task Force. The first, sent earlier this month, made several recommendations concerning coordination of state efforts that were supported and implemented by Governor Snyder.

The full FWATF report is expected to be completed in early 2016.

Members of the Task Force include:

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan.

Chris Kolb is president of the Michigan Environmental Council.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority.

Ken Sikkema is a senior policy fellow at Public Sector Consultants. (Full Disclosure - he is also a regular commenter on Michigan Radio.)

The FWATF was formed by Governor Snyder to review actions regarding the Flint water system and offer recommendations both for Flint and Michigan to protect the health and safety of state residents.

Flint water scandal: Snyder apologizes, DEQ director resigns (Fox 2 Detroit)

Gov. Rick Snyder announced changes at the Michigan DEQ.
http://www.fox2detroit.com/news/local-news/66000998-story

POSTED:DEC 29 2015 10:25PM EST
UPDATED:DEC 29 2015 11:24PM EST
FLINT, Mich. - Gov. Rick Snyder says he's sorry for Flint's water crisis as one of his top appointees resigns.
The director of the state's department of environmental quality Dan Wyant resigned.

Wyant was in charge of keeping the water safe. When Flint switched its drinking water source from Lake Huron water supplied by detroit...to the flint river - to save money -- corrosion flowed through the pipes.

Tests showed elevated levels of lead in the city's drinking water back in June. But the state didn't take action until October after blood testing showed high lead levels in Flint's children.

Flint water scandal: Snyder apologizes, DEQ director resigns

Snyder's office issued a press release Tuesday:

"I want the Flint community to know how very sorry I am that this has happened," he said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.

"When I became aware that the city of Flint's water showed elevated lead levels and that the state's handling of the situation was being questioned," he said. "I requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible missteps and areas for improvement.

"The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials ... We'll continue to work with the community members to make sure we hear and respond to their concerns.

"MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force."

In a previous FOX 2 report it was discovered a year after the city began using the Flint River as its water source; a local hospital's study found the number of Flint kids under the age of 5 years old with above average lead levels nearly doubled city-wide and in some cases, tripled.

Virginia Tech University tested resident Ronda Thornton's water. Anything more than 30 micrograms a liter is a sign of serious lead contamination. Hers registered 138.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

"But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

FLINT, MI – Mayor Karen Weaver and other local leaders say the resignation of Michigan Department of Environmental Quality Director Dan Wyant and release of Flint Water Task Force findings Tuesday are the first steps toward holding people accountable for Flint's water crisis.
"There is some accountability being put in place and that's a good thing," Weaver said. "That's what is happening and I think that's a good sign because it shows that our voices have been heard and that they will continue to be heard."
According to a statement issued by Gov. Rick Snyder on Dec. 29, he has accepted Wyant's resignation after findings from a report by the task force, which was created by Snyder in October to look into Flint's water crisis. In the same statement, Snyder also said he was "sorry" to the Flint community for the water issues.
"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust ... Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."
Weaver confirmed that she will be meeting with Snyder after the first of the year.
"I hope this will help move Flint forward," she said. "One thing that has been an issue for us here in Flint has been that broken trust. We will have a new person that we will be working with, and that's a positive step."
The task force report, which is preliminary, revealed that the MDEQ failed the city in multiple areas including regulatory failures, substance and tone of the MDEQ's response to public and the interpretation of the federal lead and copper rule.
"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," said the preliminary report. "Although many individuals and entities at state and local levels contributed to creating a prolonging problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable."
State Rep. Sheldon Neeley, D-Flint, said that he and others in the city have called for legislative hearings regarding the water crisis and that Wyant's departure is just

the first, not the only, person held responsible for the condition of Flint's water.
"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or have Gov. Rick Snyder do the deed for him," Neeley said in a statement issued Dec. 29. "There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders."
Neeley, who along with Sen. Jim Ananich, D-Flint, have been pushing for legislative hearings on Flint's water crisis, went on to say there is still "cleanup do be done" and he is "glad" that Wyant has stepped down in what Neeley considers a "disorganized and flawed DEQ."
The task force's report also says members spoke with Wyant on Dec. 16 and they were not pleased with how he responded to the city's water crisis and he was in agreement with some of their findings.
"It is our understanding that he has drawn similar conclusions in his own evaluation of MDEQ's role in the Flint water crisis," said the report. "At the same time, it was disappointing to hear his weak defense of the CCT (corrosion control treatment) decision based on the EPA's November 2015 memorandum."
Both Ananich and Neeley's push led to an independent review by the Office of State Auditor Genera,l which made it clear in a Dec. 23 letter that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water. The review was based on a series of questions sent to the auditor from Ananich in October.
The corrosiveness of Flint River water is blamed for lead that leached from pipes into drinking water, causing elevated levels of lead in the blood of Flint children.
"I think the best apology (Snyder) can offer the residents of Flint and the rest of the state is a promise that this will never happen again," Ananich said. "The proof is in the long-term commitment. I'm going to continue to work to make sure that we get that."

Michigan Gov. Rick Snyder apologizes for lead levels in Flint water (Detroit 4)
DEQ head Dan Wyant's resigns after task force blames department for crisis

By Jason Colthorp – Reporter
http://www.clickondetroit.com/news/michigan-official-resigns-amid-flint-water-issue
LANSING, Mich. - Gov. Rick Snyder issued an apology Tuesday as Dan Wyant, his head of the Department of Environmental Quality, resigned after a task force lead by the state's auditor general blasted the DEQ for it's role in Flint's water crisis.

The state’s mishandling of Flint’s water system ultimately exposed Flint residents to dangerously elevated levels of lead.

“I want the Flint community to know how very sorry I am that this has happened,” Snyder said in a statement. “And I want all Michigan citizens to know that we will learn from this experience.”

The governor’s apology and the DEQ head’s resignation has helped to temper concerns that no one cared about Flint said the city’s mayor Karen Weaver.

“One of the things we've always talked about is accountability and that seems to be what's happening,” said Weaver. “It also let us know here in Flint that our voice is being heard.”

Snyder’s apology and Wyant’s resignation come after the task force released their finding that the DEQ was primarily at fault for Flint’s unhealthy level of lead in their drinking water.

“Although many contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan,” the task force said in a written statement. “It failed in that responsibility.”

For many Flint residents like Kim Peterson, Tuesday’s announcements do little to help them feel confident about the safety of their drinking water. Peterson says she is still hesitant to drink the water even though it is again coming from a healthy source in Lake Huron.

“I take it to mean that something was really wrong with this whole system of checks and balances,” she said.

“You don't trust it because you've heard so many conflicting things from so many different people, so we still continue to buy the water.”

Mayor Weaver, however, believes Snyder’s apology is a first step toward rebuilding trust: “This is a good step to get some things started because people had lost faith and they had lost trust.”

Snyder has promised more steps will be taken after the task force releases its final and full report.

LANSING, MI -- Gov. Rick Snyder on Tuesday accepted a resignation from Michigan Department of Environmental Quality Director Dan Wyant after a task force laid responsibility for the Flint water crisis at the feet of the department.
Snyder, in a statement, announced Wyant's resignation and apologized to Flint residents after he received a letter from the Flint Water Advisory Task Force.

"...MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force," Snyder said.

Wyant and the DEQ have come under fire in recent months for handling a Flint drinking water crisis that lead to corrosive water running through city pipes and resulted in children with elevated levels of lead. In October, Wyant acknowledgeda mistake in oversight from his office, saying DEQ officials were confused about federal regulations on making the drinking water less corrosive.

The task force in its letter blamed the department for the crisis.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," read the letter to Snyder.

"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure."

The task force cited DEQ's involvement as regulatory failure, failure in substance and tone of response to the public and a failure of interpreting the lead and copper rule.

Gov. Rick Snyder recently named the Flint water crisis as his biggest disappointment in 2015.

Wyant had a long track record of service for the state. He served as director of the Michigan Department of Agriculture under both Democratic Gov. Jennifer Granholm and Republican Gov. John Engler before Gov. Rick Snyder tapped him to head up the DEQ in 2011.

He shepherded the department through a transition into being its own entity again after Gov. Jennifer Granholm had combined it with the Department of Natural Resources, forming the Department of Natural Resources and Environment. He also led the "quality of life group" within state government, meaning he coordinated efforts between the DNR, DEQ and Department of Agriculture and Rural Development.

The statement from Snyder alluded to other structural changes within the DEQ, and spokesperson Dave Murray said those decisions would be made in the coming days. DEQ spokesperson Brad Wurfel did not immediately return a call for comment.

Wyant's resignation met with mixed reaction from political groups and leaders.

Senate Minority Leader Jim Ananich (D-Flint) released the following statement:

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress. I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again."

Attorney General Bill Schuette praised Wyant's service to the state.

"I am saddened to hear of the resignation of Department of Environment Quality Director Dan Wyant. In my 20-plus years of knowing him, Dan has been a hardworking, dedicated public servant. I am committed to working with all parties, including the legislature and Governor, to ensure the public's health and the well being of Michigan residents."

Democratic Congressman Dan Kildee, who represents Flint, said the steps taken today were appropriate but encouraged further action.

"Governor Snyder's apology over the Flint water crisis is appropriate, as are personnel changes announced today at the Department of Environmental Quality," Kildee said.

"Through this ongoing crisis, the people of Flint did nothing wrong – they are victims of this failure of government. The State of Michigan must not only acknowledge its role in this crisis, but also take responsibility and act right away to make it right."

He urged the state to establish a fund to ensure that kids receive developmental, nutritional and educational resources to help overcome the effects of their lead exposure.

Rep. Sheldon Neeley, D-Flint, said Wyant was not the only offender.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or to have Gov. Rick Snyder do the deed for him. There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders," Neeley said.

"While there is still much cleanup to be done, I am glad Mr. Wyant realized he could no longer continue as the head of the disorganized and flawed DEQ, and I call on Gov. Snyder to take careful effort in repairing this department so that it earns back the trust of the people of Flint and this great state.

Progress Michigan said there had been a lack of accountability for the Flint water crisis.

"So far under Gov. Rick Snyder's watch, there has been zero accountability in this crisis and that continues today," said Lonnie Scott, executive director of Progress Michigan.

"Dan Wyant gets to walk away from this criss, but the people of Flint do not. There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable. All documentation related this this crisis needs to be released to the public immediately."

Auditor: State erred on Flint water but didn't mislead feds (AP/Crain's Detroit)

http://www.crainsdetroit.com/article/20151228/NEWS01/151229867/auditor-state-erred-on-flint-water-but-didnt-mislead-feds By David Eggert

Associated Press

Michigan Department of Environmental Quality Environment More +

LANSING — The director of Michigan's Department of Environmental Quality has resigned after the Flint Water Task Force delivered its findings on the the city's water contamination crisis to Gov. Rick Snyder.

Snyder said Tuesday afternoon in a statement that he accepted the resignation of Dan Wyant and plans to make "other personnel changes at MDEQ to address problems cited by the task force.

“But changes in leadership and staff are not enough."

In a preliminary report released Monday, Michigan's auditor general said state regulators should have required Flint to treat its corrosive drinking water to keep lead from leaching from service lines into people's homes but did not purposely mislead federal officials about the lack of corrosion control.

Doug Ringler, citing a memo issued last month by the U.S. Environmental Protection Agency, concluded that the Michigan Department of Environmental Quality erred in not requiring the city to immediately combat corrosion when it switched from Detroit's system to the Flint River in April 2014 in a cost-cutting move while under state financial management. State officials interpreted federal rules to mean Flint could make the transition and then test the new water for lead over two six-month intervals to determine potential corrosion treatment.

Flint children have been found to have elevated levels of lead in their blood since the water change. Gov. Rick Snyder's administration initially downplayed concerns but later committed funding to reconnect Flint to Detroit and to provide filters, testing and other services.

Ringler was already conducting an audit of Michigan's Office of Drinking Water and Municipal Assistance when the Flint corrosion issue arose. At the request of Senate Minority Leader Jim Ananich, he answered questions specific to Flint's lead contamination, including concerns that state regulators misled federal environmental regulators.

In February, a DEQ water supervisor told the EPA that Flint had a corrosion control program in place. But in April, an EPA official confirmed through another DEQ official that the city was not practicing corrosion treatment, according to emails. The EPA apparently interpreted the word "program" to mean treatment, while the DEQ meant it as testing to determine if corrosion controls would be needed in the future.

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA," Ringler wrote in a letter dated Wednesday and made public Monday.

The auditor concluded, however, that regardless of confusion over the federal rule, the state should have required Flint to start pursuing corrosion treatment in March after the first six months of testing showed too-high lead levels instead of waiting until August after a second six-month period. He also said the DEQ did not verify that Flint was correctly sampling water from houses only with lead pipes or lead service lines. He suggested that the department consider doing so.

"We agreed with the findings in the Auditor General's review," DEQ spokesman Brad Wurfel said. "The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues."

The Republican governor has come under scrutiny for the Flint fiasco. Spokesman Dave Murray said the letter "includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified. But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels."

Ananich, D-Flint, said "there are serious failings in our system that must be addressed" and again called for GOP leaders to schedule legislative hearings. They

have rejected the requests, citing the work of a task force formed by Snyder.
The auditor's letter did not provide clarity on who specifically decided to use the Flint River for water. It was supposed to be an interim source until the city could join a new system getting water from Lake Huron.
Ringler noted that the city council voted in March 2013 to support moving to the Karegnondi Water Authority but was "silent" on using the river temporarily. Flint was being run by a Snyder-appointed manager until this past April and remains under some state oversight.

BREAKING: DEQ Director Resigns Over Flint Water Crisis (West Bloomfield Patch)
Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.
http://patch.com/michigan/westbloomfield/breaking-deq-director-resigns-over-flint-water-crisis
West Bloomfield, MI

By BETH DALBEY (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.
DEQ Director Dan Wyant "has offered his resignation, and I've determined that it's appropriate to accept it," Snyder said in a statement.

The governor said he will be "making other personnel changes at MDEQ" as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency reliefto deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

State Delayed Action on Lead in Flint Water
The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

Opioid Addicts Younger Than Ever: Study

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.
The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to theWorld Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

"I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure," he wrote.

Changes in leadership and staff aren't enough, Snyder said. The statement continued:

"I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

"Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions," he wrote. "Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term.

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

MDEQ Director Wyant resigns over Flint water crisis, Snyder apologizes (Michigan Radio)

UPDATED AT 5:37 PM ON 12/29/15

The head of the Michigan Department of Environmental Quality (MDEQ) has resigned over the drinking water crisis in Flint.

Gov. Rick Snyder has also now apologized to the community of Flint for his administration’s involvement in the situation.

“I want the Flint community to know how very sorry I am that this has happened,” said Snyder in a statement on Tuesday. “And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.”

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust.”

MDEQ Director Dan Wyant will step down immediately. The resignation comes after Snyder received initial findings from the task force he appointed to investigate the situation. A number of reports have pointed to mistakes the department made that resulted in elevated lead levels in the city’s water.

The governor says he plans to make additional personnel changes in the department – although he hasn’t announced what those will be. And he says he’ll meet with Flint Mayer Karen Weaver to discuss further actions the state could take to help the city.

Also resigning from the MDEQ today was spokesman Brad Wurfel.

Letter says the state department is at fault in Flint Water Crisis (WLNS News 6)

LANSING, MI. (WLNS) – At the state capital, a letter sent to Governor Snyder from his Flint Water Crisis task force says there's a state department to blame for the city's water problems.

In the letter the task force says the Department of Environmental Quality must be held accountable for failing to ensure the safe drinking water for people of Flint.

It says Flint residents were exposed to toxic levels of lead in their water because of a culture of passive compliance.

In addition to the letter, Dan Wyant stepped down as director of the department

I think we need to reach out to TRMS to correct the repeated references to a "EPA whistleblower/rogue employee" that appear in this segment and previous segments. Our review of EPA actions in Flint show that the so-called whistleblower/rogue employee was acting under the direction of and with the support of EPA management when he tested water at three residences in Flint and prepared a report summarizing his findings. I personally objected to MDEQ management and the Governor's office when they called this R5 staffer a "rogue employee." This misrepresentation is especially problematic in the wake of the House Oversight hearing last summer, which focused on alleged whistleblowers in R5. I don't know if we need to ask for a formal correction, but we should at least ask TRMS to avoid this inaccurate characterization in future segments.

I am happy to talk about this if you would like us to set up a call.

LANSING — Gov. Rick Snyder apologized to the City of Flint on Tuesday for the drinking water crisis that has left children poisoned by lead and announced that he accepted the resignation of Michigan Department of Environmental Quality Director Dan Wyant.

Snyder said in a news release that there will be other personnel changes at the DEQ and that the moves he announced are among "initial steps" he is taking to assure the safety of Flint residents, with more action to come.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The governor, who previously stood by his DEQ director amid the controversy, said, "Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it."

Before joining the Snyder administration as DEQ director, Wyant was president and chief operating officer of the Edward Lowe Foundation, which promotes entrepreneurship and helps business owners grow their companies. Before that, he served as director of the Michigan Department of Agriculture under Govs. John Engler and Jennifer Granholm.

Brad Wurfel, the DEQ public information officer who apologized after criticizing a researcher's reports of rising lead levels in the blood of Flint children as irresponsible, also resigned Tuesday, a spokesman for Snyder confirmed.

The governor said he acted based on interim findings of the Flint Water Advisory Task Force, which he appointed Oct. 21 to investigate the crisis and is continuing its work. He received a letter Tuesday morning that was highly critical of the DEQ.

The letter from the task force said the "primary responsibility" for what happened in Flint lies with the DEQ; the agency "failed in its responsibility" to ensure safe drinking water for Michigan residents and "must be held accountable for that failure." It was signed by task force members Matt Davis, Chris Kolb, Larry Reynolds, Eric Rothstein and Ken Sikkema.

The Free Press reported Thursday that records obtained by the Michigan ACLU and Virginia Tech researcher Marc Edwards show that elevated lead levels in Flint's drinking water would have spurred action months sooner if the results of city testing that wrapped up in June had not been revised by the DEQ to wrongly indicate the water was safe to drink.

Auditor General Doug Ringler said in a letter released Monday that it was appropriate for the DEQ to disqualify two samples with high lead levels that did not meet the sampling criteria. But the records obtained by the ACLU and Edwards also show that a DEQ official sent Flint an e-mail saying that samples as of late June showed Flint's water had lead levels above the "action level" that would require public notice and remedial action, and he hoped the city could send the remaining required samples quickly and that they would be below the action level for lead.

The records also suggest the DEQ was not as strict in disqualifying samples with low lead levels that did not meet the testing criteria as it was in disqualifying samples with high lead readings.

'It's ... not enough'

Flint, which was under the control of a state-appointed emergency manager at the time of the cost-cutting move, switched its drinking water source, starting in April 2014, from Lake Huron water supplied by Detroit to the much more polluted and corrosive water from the Flint River.

The state has acknowledged that it misinterpreted a federal rule and failed to require Flint to add needed corrosion-control chemicals that would have prevented lead from leaching into the drinking water from pipes, connections and fixtures.

That change in the drinking-water source brought immediate complaints from Flint residents about the taste, smell and appearance of the water. The lead tests of the water could have spurred action in July, but it was not until October — after blood test results analyzed by Hurley Children's Hospital pediatrician Dr. Mona Hanna-Attisha showed elevated lead levels in Flint children — that the DEQ admitted making a mistake by failing to require the addition of corrosion-control chemicals to the Flint River water. The state also then provided funds to help Flint reconnect to Lake Huron water supplied by Detroit.

Lead can cause irreversible brain damage in children and has also been linked to behavioral problems.

Melissa Mays, a Flint resident who drank the contaminated water along with her three boys, said she was more shocked by Snyder's apology than by Wyant's resignation. She welcomed the announcements but said more DEQ officials need to be removed because Flint residents can't trust those officials to make sure their water is safe to drink today.

"This all should have happened a long time ago, and it's also not enough," she said.

Mays questioned why Snyder has not endorsed Flint Mayor Karen Weaver's declaration of a state of emergency in Flint, which she said would help secure federal funding to help rectify problems.

Snyder spokesman Dave Murray said "no formal request has been made to the state" to declare a state of emergency in Flint.

"We are committed to working with Mayor Weaver and Genesee County leaders," and the emergency management division of the Michigan State Police is working with city and county officials on potential avenues for federal aid, Murray said.

The crisis has prompted a federal class-action and calls for an investigation by the U.S. Department of Justice.

Goals: Openness, trust

Snyder said "changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water."

Snyder said he wants to "share research on water and blood-lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

The other personnel changes at DEQ referenced by Snyder, aside from Wurfel's resignation, have not yet been made, Murray said.

“I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens.”

The letter from the task force said a minimalist culture of "technical compliance" had developed in the DEQ's Office of Drinking Water and Municipal Assistance and "it led to MDEQ's failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

The office "must adopt a posture that is driven not by this minimalist technical compliance approach, but rather by one that is founded on what needs to be done to assure drinking water safety," the letter said.

The letter also said that both the tone and substance of DEQ statements to the public during the crisis were "completely unacceptable," marked by a "persistent tone of scorn and derision."

Task force members met with Wyant, and while he agreed with many of the task force's interim conclusions, "it was disappointing to hear his weak defense of the (corrosion control) decision," the letter said.

Senate Minority Leader Jim Ananich, D-Flint, said the personnel changes Snyder announced could be a sign of progress if they "lead to a more aggressive response and resources to improve public health."

"I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again," Ananich said in a news release.

"Dan Wyant gets to walk away from this crisis, but the people of Flint do not," said Lonnie Scott, the group's executive director. "There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable."

(Photo: Dale G. Young / The Detroit News)

Michigan's top environmental official resigned Tuesday after an independent task force delivered its initial findings on the Flint water contamination crisis — conclusions that also prompted an apology from Gov. Rick Snyder.

Dan Wyant, director of the Department of Environmental Quality since 2011, tendered his resignation Tuesday, marking the second agency shakeup in just over two months related to Flint's lead-tainted drinking water problems. The industrial city has been plagued by lead issues since an April 2014 switch to the Flint River as its water source.

A Snyder-appointed task force investigating the long-running situation announced it found Tuesday the DEQ "primarily responsible for failing to ensure safe drinking water in Flint." Snyder accepted the initial findings and Wyant's resignation — "I've determined that it's appropriate to accept it, he said — and then issued an apology.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a press release. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust."

A Flint Water Advisory Task Force co-chair blamed the DEQ's passive culture for Flint's water ills.

"Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance that is simply insufficient to the task of public protection," wrote Ken Sikkema, a former state senator. "We also believe that the dismissive and disrespectful tone of much of the MDEQ's response to public concerns is unacceptable."

The water switch, made while Flint was under the leadership of a Snyder-appointed emergency manager, immediately led to resident complaints about the smell, taste and discoloration of their drinking water. Eventually, researchers found a link between the switch and a rise in lead poisoning among city children.

Lead poisoning can cause learning disabilities and, at high levels, may lead to seizures, coma and death, according to the Centers for Disease Control and Prevention.

Wyant could not be reached for comment Tuesday. In October, Wyant admitted the DEQ erred in its application of the federal Lead and Copper Rule, designed to ensure safe drinking water for residents.

Late on Tuesday, DEQ spokesman Brad Wurfel resigned as well.

Flint was allowed to begin drawing its drinking water from the river without any corrosion controls in place to prevent lead in old plumbing connections from leaching. The task force said the DEQ failed in the regulatory handling of Flint's water problems, the "substance and tone" in the department's response as well as its "interpretation of the Lead and Copper Rule."

State Sen. Jim Ananich, D-Flint, criticized the DEQ culture Tuesday, saying workers were more concerned with following rules than informing the public about potential problems.

"When you have lead in the water, I don't care if you follow the rules or not: You need to notify the public first," Ananich said.

Critics have put increasing pressure on Snyder's administration to answer for the Flint water decisions in the last two years. Among the harshest critics is Marc Edwards, a Virginia Tech researcher whose water sampling at Flint homes and public record requests have helped keep the spotlight on the state government's actions.

But Edwards said Wyant should not be the one on the chopping block.

"I'm glad that someone is sorry and someone is being held accountable," Edwards said. "But Dan Wyant would not be at the top of my list — or even on the list. I feel strongly he was misled by his staff at every point, and he was put in publicly embarrassing situations by the staff's misinformation."

Dr. Mona Hanna-Attisha, a Hurley Medical Center pediatrician who uncovered lead exposure in city children following the switch, echoed Edwards by saying DEQ staffers' mistakes led to Flint's problems.

"(Wyant) wasn't directly involved," she said. "There are other people, particularly in (the Office of Drinking Water and Municipal Assistance), that need to take some responsibility. ... (Wyant) was a nice person being fed bad information."

In 2013, Flint agreed to create a new regional water authority in an attempt to save money. The city had tried to negotiate lower rates with former provider Detroit Water and Sewerage Department for years, to little avail.

But the Karegondi Water Authority will not be completed until some time next year. In the interim, Flint looked to its river to provide drinking water. That water turned out to be far more corrosive than the Lake Huron water used by the Detroit system.

With pressure mounting from troublesome water samples and health studies, Flint reconnected to the Detroit system in October.

Snyder previously was elusive in acknowledging the extent of the state's responsibility for the lead contamination of the city's water when it switched to the more corrosive Flint River in 2014, saying he was awaiting the task force report. On Tuesday, the governor was more contrite.

“We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways,” Snyder said. “Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.”

Michigan Regulator Resigns Amid Flint's Lead-in-Water Crisis (AP)
By DAVID EGGERT, ASSOCIATED PRESS
LANSING, Mich. — Dec 29, 2015, 7:16 PM ET
http://abcnews.go.com/Politics/wireStory/michigan-official-resigns-amid-flint-water-issue-35996502

Michigan's top environmental regulator resigned Tuesday after elevated levels of lead were found in Flint children during a drinking water crisis that a task force blamed primarily on his agency.

Gov. Rick Snyder accepted the resignation of Department of Environmental Quality Director Dan Wyant and apologized for what occurred in Flint, which switched its drinking water supply in a cost-cutting move while under state financial management. Communications director Brad Wurfel also resigned, and Snyder said he plans additional personnel changes in the agency.

Wyant quit the same day a task force appointed by the Republican governor reported that the department was primarily responsible for the fiasco because it did not require Flint to keep corrosive water from leaching lead from service pipes into residents' homes and belittled concerns from the public. Exposure to lead can cause behavior problems and learning disabilities in children.

"I want the Flint community to know how very sorry I am that this has happened," Snyder said in a written statement. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure."

The five-member task force, which previously brought up concerns about a lack of organization in responding to the disaster, said the environmental department's Office of Drinking Water and Municipal Assistance has a "minimalist approach" to regulatory oversight in which "technical compliance" is sufficient. It faulted the agency for a "tone of scorn and derision" toward the public, including outside water and health experts who raised alarm bells.

The task force confirmed that the state did not follow the federal Lead and Copper Rule when Flint disconnected from Detroit's water system in April 2014 and switched to Flint River water while waiting to connect to a new regional water authority.

Detroit's water from Lake Huron had been treated for corrosion. State officials thought that after Flint made the transition to the river it could test the new water for lead over two six-month intervals to determine potential corrosion treatment instead of needing to immediately add corrosion controls. Flint returned to Detroit's water in October after a public health emergency was declared.

The task force, which met with Wyant on Dec. 16, noted his substantial agreement with many of its conclusions but expressed disappointment with his "weak defense" regarding the federal rule.
The U.S. Environmental Protection Agency said in a November memo that there are "differing possible interpretations" of the Lead and Copper Rule, explaining that it does not explicitly discuss a scenario like in Flint.
But task force members said, "Individuals and agencies responsible must be held accountable in a timely fashion."

They also cited recent revelations of the Department of Health and Human Services' apparent early knowledge of and silence about elevated blood-lead levels, and said the committee's final report in early 2016 would review local governments' decision processes while under emergency management.
"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust," Snyder said.
Wyant, 56, led the Environmental Quality Department for nearly five years. He previously served as the state's agricultural director under Republican Gov. John Engler and Democratic Gov. Jennifer Granholm.
"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress," said Senate Minority Leader Jim Ananich, a Democrat from Flint.

Task force lays most blame for Flint water crisis on MDEQ (Michigan Radio)

By VINCENT DUFFY • 14 HOURS AGO
SHARETwitter Facebook Google+ Email
http://michiganradio.org/post/task-force-lays-most-blame-flint-water-crisis-mdeq#stream/0
MDEQ Director Dan Wyant at a recent press conference.
CREDIT SCREEN GRAB / MLIVE USTREAM
A task force appointed by Gov. Rick Snyder says Michigan's environmental regulatory agency is primarily responsible for the state's failure to ensure safe drinking water for Flint residents.

The Flint Water Advisory Task Force says in a letter to Snyder that the state Department of Environmental Quality "must be held accountable for that failure."

The letter was made public Tuesday. You can read it here.

Corrosive Flint River water leached lead from service pipes into homes after the city switched last year from Detroit water. Elevated blood-lead levels later were found in some children.

Department of Environmental Quality Director Dan Wyant and spokesman Brad Wurfel both resigned Tuesday.

Task force co-chair Ken Sikkema says in the letter that "Flint residents were exposed to toxic levels of lead in their water primarily due to a regulatory culture of passive technical compliance."

The FWATF letter stated in part:

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ). Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure."

"The City of Flint's water customers—fellow Michigan citizens—were needlessly and tragically exposed to toxic levels of lead through their drinking water supply. They deserve a commitment to properly assess responsibility and ensure accountability. They also deserve a commitment to needed mitigation in both the short and long term. The Flint water crisis never should have happened. Having failed to prevent it, state government should coordinate a sustained, public-health-focused response to remedy, to the fullest extent possible, the impacts on the Flint community."

The letter outlined three areas where MDEQ failed:

Regulatory Failure
Failure in Substance and Tone of MDEQ Response to the Public
Failure in MDEQ Interpretation of the Lead and Copper Rule
This is the second letter sent by the Task Force. The first, sent earlier this month, made several recommendations concerning coordination of state efforts that were supported and implemented by Governor Snyder.

The full FWATF report is expected to be completed in early 2016.

Members of the Task Force include:

Matthew Davis, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan.

Chris Kolb is president of the Michigan Environmental Council.

Lawrence Reynolds, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center.

Eric Rothstein is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority.

Ken Sikkema is a senior policy fellow at Public Sector Consultants. (Full Disclosure - he is also a regular commenter on Michigan Radio.)

The FWATF was formed by Governor Snyder to review actions regarding the Flint water system and offer recommendations both for Flint and Michigan to protect the health and safety of state residents.

Flint water scandal: Snyder apologizes, DEQ director resigns (Fox 2 Detroit)

Gov. Rick Snyder announced changes at the Michigan DEQ.
http://www.fox2detroit.com/news/local-news/66000998-story

POSTED:DEC 29 2015 10:25PM EST
UPDATED:DEC 29 2015 11:24PM EST
FLINT, Mich. - Gov. Rick Snyder says he's sorry for Flint's water crisis as one of his top appointees resigns.
The director of the state's department of environmental quality Dan Wyant resigned.

Wyant was in charge of keeping the water safe. When Flint switched its drinking water source from Lake Huron water supplied by detroit...to the flint river - to save money -- corrosion flowed through the pipes.

Tests showed elevated levels of lead in the city's drinking water back in June. But the state didn't take action until October after blood testing showed high lead levels in Flint's children.
Flint water scandal: Snyder apologizes, DEQ director resigns
Snyder's office issued a press release Tuesday:
"I want the Flint community to know how very sorry I am that this has happened," he said. "And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.
"When I became aware that the city of Flint's water showed elevated lead levels and that the state's handling of the situation was being questioned," he said. "I requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible

missteps and areas for improvement.

"The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials ... We'll continue to work with the community members to make sure we hear and respond to their concerns.

"MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force."

In a previous FOX 2 report it was discovered a year after the city began using the Flint River as its water source; a local hospital's study found the number of Flint kids under the age of 5 years old with above average lead levels nearly doubled city-wide and in some cases, tripled.

Virginia Tech University tested resident Ronda Thornton's water. Anything more than 30 micrograms a liter is a sign of serious lead contamination. Hers registered 138.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

"But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term."

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

Gov. Rick Snyder still doesn't get it when it comes to Flint water crisis

Director Dan Wyant resigns after task force blasts MDEQ over Flint water crisis

All Stories

FLINT, MI – Mayor Karen Weaver and other local leaders say the resignation of Michigan Department of Environmental Quality Director Dan Wyant and release of Flint Water Task Force findings Tuesday are the first steps toward holding people accountable for Flint's water crisis.

"There is some accountability being put in place and that's a good thing," Weaver said. "That's what is happening and I think that's a good sign because it shows that our voices have been heard and that they will continue to be heard."

According to a statement issued by Gov. Rick Snyder on Dec. 29, he has accepted Wyant's resignation after findings from a report by the task force, which was created by Snyder in October to look into Flint's water crisis. In the same statement, Snyder also said he was "sorry" to the Flint community for the water issues.

"I know many Flint citizens are angry and want more than an apology," Snyder said. "That's why I'm taking the actions today to ensure a culture of openness and trust ... Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance."

Weaver confirmed that she will be meeting with Snyder after the first of the year.

"I hope this will help move Flint forward," she said. "One thing that has been an issue for us here in Flint has been that broken trust. We will have a new person that we will be working with, and that's a positive step."

The task force report, which is preliminary, revealed that the MDEQ failed the city in multiple areas including regulatory failures, substance and tone of the MDEQ's response to public and the interpretation of the federal lead and copper rule.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," said the preliminary report. "Although many individuals and entities at state and local levels contributed to creating a prolonging problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable."

State Rep. Sheldon Neeley, D-Flint, said that he and others in the city have called for legislative hearings regarding the water crisis and that Wyant's departure is just the first, not the only, person held responsible for the condition of Flint's water.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or have Gov. Rick Snyder do the deed for him," Neeley said in a statement issued Dec. 29. "There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders."

Neeley, who along with Sen. Jim Ananich, D-Flint, have been pushing for legislative hearings on Flint's water crisis, went on to say there is still "cleanup do be done" and he is "glad" that Wyant has stepped down in what Neeley considers a "disorganized and flawed DEQ."

The task force's report also says members spoke with Wyant on Dec. 16 and they were not pleased with how he responded to the city's water crisis and he was in agreement with some of their findings.

"It is our understanding that he has drawn similar conclusions in his own evaluation of MDEQ's role in the Flint water crisis," said the report. "At the same time, it was disappointing to hear his weak defense of the CCT (corrosion control treatment) decision based on the EPA's November 2015 memorandum."

Both Ananich and Neeley's push led to an independent review by the Office of State Auditor Genera,l which made it clear in a Dec. 23 letter that corrosion control should have been maintained during Flint's transition from Detroit water to Flint River water. The review was based on a series of questions sent to the auditor from Ananich in October.

The corrosiveness of Flint River water is blamed for lead that leached from pipes into drinking water, causing elevated levels of lead in the blood of Flint children.

"I think the best apology (Snyder) can offer the residents of Flint and the rest of the state is a promise that this will never happen again," Ananich said. "The proof is in the long-term commitment. I'm going to continue to work to make sure that we get that."

Michigan Gov. Rick Snyder apologizes for lead levels in Flint water (Detroit 4)

DEQ head Dan Wyant's resigns after task force blames department for crisis

By Jason Colthorp – Reporter

http://www.clickondetroit.com/news/michigan-official-resigns-amid-flint-water-issue

LANSING, Mich. - Gov. Rick Snyder issued an apology Tuesday as Dan Wyant, his head of the Department of Environmental Quality, resigned after a task force lead by the state's auditor general blasted the DEQ for it's role in Flint's water crisis.

The state's mishandling of Flint's water system ultimately exposed Flint residents to dangerously elevated levels of lead.

“I want the Flint community to know how very sorry I am that this has happened,” Snyder said in a statement. “And I want all Michigan citizens to know that we will learn from this experience.”

The governor's apology and the DEQ head's resignation has helped to temper concerns that no one cared about Flint said the city's mayor Karen Weaver.

“One of the things we've always talked about is accountability and that seems to be what's happening,” said Weaver. “It also let us know here in Flint that our voice is being heard.”

Snyder's apology and Wyant's resignation come after the task force released their finding that the DEQ was primarily at fault for Flint's unhealthy level of lead in their drinking water.

"Although many contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan," the task force said in a written statement. "It failed in that responsibility."

For many Flint residents like Kim Peterson, Tuesday's announcements do little to help them feel confident about the safety of their drinking water. Peterson says she is still hesitant to drink the water even though it is again coming from a healthy source in Lake Huron.

"I take it to mean that something was really wrong with this whole system of checks and balances," she said.

"You don't trust it because you've heard so many conflicting things from so many different people, so we still continue to buy the water."

Mayor Weaver, however, believes Snyder's apology is a first step toward rebuilding trust: "This is a good step to get some things started because people had lost faith and they had lost trust."

Snyder has promised more steps will be taken after the task force releases its final and full report.

on December 29, 2015 at 4:39 PM, updated December 29, 2015 at 6:51 PM
LANSING, MI -- Gov. Rick Snyder on Tuesday accepted a resignation from Michigan Department of Environmental Quality Director Dan Wyant after a task force laid responsibility for the Flint water crisis at the feet of the department.
Snyder, in a statement, announced Wyant's resignation and apologized to Flint residents after he received a letter from the Flint Water Advisory Task Force.
"...MDEQ Director Dan Wyant has offered his resignation, and I've determined that it's appropriate to accept it. I'm also making other personnel changes at MDEQ to address problems cited by the task force," Snyder said.
Wyant and the DEQ have come under fire in recent months for handling a Flint

drinking water crisis that lead to corrosive water running through city pipes and resulted in children with elevated levels of lead. In October, Wyant acknowledgeda mistake in oversight from his office, saying DEQ officials were confused about federal regulations on making the drinking water less corrosive.

The task force in its letter blamed the department for the crisis.

"We believe the primary responsibility for what happened in Flint rests with the Michigan Department of Environmental Quality (MDEQ)," read the letter to Snyder.

"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, MDEQ is the government agency that has responsibility to ensure safe drinking water in Michigan. It failed in that responsibility and must be held accountable for that failure."

The task force cited DEQ's involvement as regulatory failure, failure in substance and tone of response to the public and a failure of interpreting the lead and copper rule.

Gov. Rick Snyder recently named the Flint water crisis as his biggest disappointment in 2015.

Wyant had a long track record of service for the state. He served as director of the Michigan Department of Agriculture under both Democratic Gov. Jennifer Granholm and Republican Gov. John Engler before Gov. Rick Snyder tapped him to head up the DEQ in 2011.

He shepherded the department through a transition into being its own entity again after Gov. Jennifer Granholm had combined it with the Department of Natural Resources, forming the Department of Natural Resources and Environment. He also led the "quality of life group" within state government, meaning he coordinated efforts between the DNR, DEQ and Department of Agriculture and Rural Development.

The statement from Snyder alluded to other structural changes within the DEQ, and spokesperson Dave Murray said those decisions would be made in the coming days. DEQ spokesperson Brad Wurfel did not immediately return a call for comment.

Wyant's resignation met with mixed reaction from political groups and leaders.

Senate Minority Leader Jim Ananich (D-Flint) released the following statement:

"If these personnel moves and change in tone lead to a more aggressive response and resources to improve public health, then we are finally making progress. I still believe that legislative hearings will be required to get all the answers and help shape the necessary policy changes, and ensure this never happens again."

Attorney General Bill Schuette praised Wyant's service to the state.

"I am saddened to hear of the resignation of Department of Environment Quality Director Dan Wyant. In my 20-plus years of knowing him, Dan has been a hardworking, dedicated public servant. I am committed to working with all parties, including the legislature and Governor, to ensure the public's health and the well being of Michigan residents."

Democratic Congressman Dan Kildee, who represents Flint, said the steps taken today were appropriate but encouraged further action.

"Governor Snyder's apology over the Flint water crisis is appropriate, as are personnel changes announced today at the Department of Environmental Quality," Kildee said.

"Through this ongoing crisis, the people of Flint did nothing wrong – they are victims of this failure of government. The State of Michigan must not only acknowledge its role in this crisis, but also take responsibility and act right away to make it right."

He urged the state to establish a fund to ensure that kids receive developmental, nutritional and educational resources to help overcome the effects of their lead exposure.

Rep. Sheldon Neeley, D-Flint, said Wyant was not the only offender.

"For months, the call has been public and aggressive for Dan Wyant to remove himself from his position, or to have Gov. Rick Snyder do the deed for him. There are many culpable parties involved in the continued decline of health and safety during the water crisis in the city of Flint, and Wyant was just one figure in a menagerie of offenders," Neeley said.

"While there is still much cleanup to be done, I am glad Mr. Wyant realized he could no longer continue as the head of the disorganized and flawed DEQ, and I call on Gov. Snyder to take careful effort in repairing this department so that it earns back the trust of the people of Flint and this great state.

Progress Michigan said there had been a lack of accountability for the Flint water crisis.

"So far under Gov. Rick Snyder's watch, there has been zero accountability in this crisis and that continues today," said Lonnie Scott, executive director of Progress Michigan.

"Dan Wyant gets to walk away from this criss, but the people of Flint do not. There's a lot we don't know about this man-made catastrophe. What did Gov. Snyder know and when did he know it? We need complete transparency so that justice for the families of Flint can be realized and the proper people can be held accountable. All documentation related this this crisis needs to be released to the public immediately."

Auditor: State erred on Flint water but didn't mislead feds (AP/Crain's Detroit)

http://www.crainsdetroit.com/article/20151228/NEWS01/151229867/auditor-state-erred-on-flint-water-but-didnt-mislead-feds By David Eggert
Associated Press

Michigan Department of Environmental Quality Environment More +

LANSING — The director of Michigan's Department of Environmental Quality has resigned after the Flint Water Task Force delivered its findings on the the city's water contamination crisis to Gov. Rick Snyder.

Snyder said Tuesday afternoon in a statement that he accepted the resignation of Dan Wyant and plans to make "other personnel changes at MDEQ to address problems cited by the task force.

“But changes in leadership and staff are not enough."

In a preliminary report released Monday, Michigan's auditor general said state regulators should have required Flint to treat its corrosive drinking water to keep lead from leaching from service lines into people's homes but did not purposely mislead federal officials about the lack of corrosion control.

Doug Ringler, citing a memo issued last month by the U.S. Environmental Protection Agency, concluded that the Michigan Department of Environmental Quality erred in not requiring the city to immediately combat corrosion when it switched from Detroit's system to the Flint River in April 2014 in a cost-cutting move while under state financial management. State officials interpreted federal rules to mean Flint could make the transition and then test the new water for lead over two six-month intervals to determine potential corrosion treatment.

Flint children have been found to have elevated levels of lead in their blood since the water change. Gov. Rick Snyder's administration initially downplayed concerns but later committed funding to reconnect Flint to Detroit and to provide filters, testing and other services.

Ringler was already conducting an audit of Michigan's Office of Drinking Water and Municipal Assistance when the Flint corrosion issue arose. At the request of Senate Minority Leader Jim Ananich, he answered questions specific to Flint's lead contamination, including concerns that state regulators misled federal environmental regulators.

In February, a DEQ water supervisor told the EPA that Flint had a corrosion control program in place. But in April, an EPA official confirmed through another DEQ official that the city was not practicing corrosion treatment, according to emails.

The EPA apparently interpreted the word "program" to mean treatment, while the DEQ meant it as testing to determine if corrosion controls would be needed in the future.

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA," Ringler wrote in a letter dated Wednesday and made public Monday.

The auditor concluded, however, that regardless of confusion over the federal rule, the state should have required Flint to start pursuing corrosion treatment in March after the first six months of testing showed too-high lead levels instead of waiting until August after a second six-month period. He also said the DEQ did not verify that Flint was correctly sampling water from houses only with lead pipes or lead service lines. He suggested that the department consider doing so.

"We agreed with the findings in the Auditor General's review," DEQ spokesman Brad Wurfel said. "The findings align with our internal department review. We appreciate the Auditor General's work to provide a fair and well considered look at some key issues."

The Republican governor has come under scrutiny for the Flint fiasco. Spokesman Dave Murray said the letter "includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified. But

we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels."
Ananich, D-Flint, said "there are serious failings in our system that must be addressed" and again called for GOP leaders to schedule legislative hearings. They have rejected the requests, citing the work of a task force formed by Snyder.
The auditor's letter did not provide clarity on who specifically decided to use the Flint River for water. It was supposed to be an interim source until the city could join a new system getting water from Lake Huron.
Ringler noted that the city council voted in March 2013 to support moving to the Karegnondi Water Authority but was "silent" on using the river temporarily. Flint was being run by a Snyder-appointed manager until this past April and remains under some state oversight.

BREAKING: DEQ Director Resigns Over Flint Water Crisis (West Bloomfield Patch)
Gov. Rick Snyder apologizes to Flint, pledges to help officials address public health crisis surrounding dangerous lead levels in water.

West Bloomfield, MI

By BETH DALBEY (Patch Staff) December 29, 2015

LANSING, MI – The director of the Michigan Department of Environmental Quality has resigned over the Flint water debacle, Gov. Rick Snyder said Tuesday.
DEQ Director Dan Wyant “has offered his resignation, and I’ve determined that it’s appropriate to accept it,” Snyder said in a statement.

The governor said he will be “making other personnel changes at MDEQ” as well.

State officials encouraged officials in Flint, where the mayor has asked for federal emergency reliefto deal with a public health crisis resulting from high lead levels in water, to understate the results, according to e-mails obtained by the American Civil Liberties Union of Michigan and Marc Edwards, a Virginia Tech researcher who helped bring the water crisis to the forefront.

After the testing revealed dangerous lead levels in June, the Michigan Department of Environmental Quality wrongly indicated the water was safe to drink, according to the e-mails.

State Delayed Action on Lead in Flint Water
The financially struggling city of Flint turned off the taps to water from Detroit, which gets its supply from Lake Huron, and switched to water from the Flint River in a money-saving move in 2014. Flint was under the control of a state-appointed emergency manager at the time.

The e-mail trail suggests state officials were aware of the impending water crisis well ahead of a study released in September by West Bloomfield pediatrician Dr. Mona Hanna-Attisha, pediatric residency director at Flint's Hurley Children's Hospital.

Opioid Addicts Younger Than Ever: Study

The study showed the proportion of children with above-average levels of lead in their blood had nearly doubled since the city began getting its water from the Flint River.
The consequences of lead poisoning are serious and long lasting.

Lead's trail is virtually invisible, discoverable only through finger-prick blood test or when children begin showing signs of learning disabilities, reduced IQ, behavioral changes, anti-social behavior, anemia, hypertension, renal impairment, immunotoxicity and a plethora of other neurological and behavioral problems that are thought to be irreversible, according to theWorld Health Organization.

The e-mails showed that DEQ district coordinator Stephen Busch told the U.S. Environmental Protection Agency in February that Flint had "an optimized corrosion control program" to prevent lead from getting into the water system when, in fact, the city had no corrosion control program at all.

In his statement, the governor apologized to the residents of Flint and to residents of other cities with aging infrastructure.

"I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure," he wrote.

Changes in leadership and staff aren't enough, Snyder said. The statement continued:

"I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and

Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve Flint water.

“Let’s share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions,” he wrote. “Together, we should work to affirm that we’re using the very best testing protocols to ensure Flint residents have safe drinking water and that we’re taking steps to protect their health over the short and long term.

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust. We’ve already allocated $10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we’re going to meet soon to discuss other ways the state can offer assistance.

“These are only initial steps — we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we’re committed to doing everything we can to protect the well-being of our citizens.”

MDEQ Director Wyant resigns over Flint water crisis, Snyder apologizes (Michigan Radio)

UPDATED AT 5:37 PM ON 12/29/15

The head of the Michigan Department of Environmental Quality (MDEQ) has resigned over the drinking water crisis in Flint.

Gov. Rick Snyder has also now apologized to the community of Flint for his administration’s involvement in the situation.

“I want the Flint community to know how very sorry I am that this has happened,” said Snyder in a statement on Tuesday. “And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.”

“I know many Flint citizens are angry and want more than an apology. That’s why I’m taking the actions today to ensure a culture of openness and trust.”

MDEQ Director Dan Wyant will step down immediately. The resignation comes after Snyder received initial findings from the task force he appointed to investigate the situation. A number of reports have pointed to mistakes the department made that resulted in elevated lead levels in the city's water.

The governor says he plans to make additional personnel changes in the department – although he hasn't announced what those will be. And he says he'll meet with Flint Mayer Karen Weaver to discuss further actions the state could take to help the city.

Also resigning from the MDEQ today was spokesman Brad Wurfel.

Letter says the state department is at fault in Flint Water Crisis (WLNS News 6)

LANSING, MI. (WLNS) – At the state capital, a letter sent to Governor Snyder from his Flint Water Crisis task force says there's a state department to blame for the city's water problems.

In the letter the task force says the Department of Environmental Quality must be held accountable for failing to ensure the safe drinking water for people of Flint.

It says Flint residents were exposed to toxic levels of lead in their water because of a culture of passive compliance.

In addition to the letter, Dan Wyant stepped down as director of the department

Keith Creagh

Michigan's Department of Environmental Quality remained in flux Wednesday after a change in leadership at the top and ongoing questions about whether any rank-and-file

staffers may get disciplined because of the Flint water contamination crisis.

Department of Natural Resources Director Keith Creagh became the interim head of the DEQ on Wednesday after Gov. Rick Snyder accepted Tuesday the resignation of agency director Dan Wyant — just over five years after he was named to the post. Creagh's former deputy, Bill Moritz, is taking the reins at the DNR.

It is unclear if additional personnel changes are in the offing for the DEQ after an independent review panel singled out the agency as having "primary responsibility for what happened in Flint." The city's drinking water has prompted a year and a half of complaints about the odor, taste and smell, as well as the findings in August of elevated lead levels in some of Flint's children.

On Wednesday, a Snyder spokesperson would say "There will be other personnel changes at DEQ, but those are not resolved yet."

Some of the harshest critics of the DEQ's handling of the Flint water situation have said Wyant was hamstrung by bad information provided to him by subordinates.

Creagh's interim appointment is a natural move because the Natural Resources and Environmental Quality departments used to be a single unit before the Republican governor separated them when he took office in 2011.

Snyder has vowed to search for a long-term replacement to lead the environmental protection agency. Wyant's departure was applauded by some critics and came on the heels of problems with lead contamination in Flint's drinking water after the city switched its source to the Flint River from the Detroit water system's Lake Huron for cost reasons.

The water switch by Flint, which was run by a state-appointed emergency manager from December 2011 until April, was meant to buy time until the city could finish a new regional authority in 2016. The stakes rose dramatically in August and September when testing and health studies showed a link between the switch to the corrosive river water and a rise in lead levels in the blood of city children.

Flint reconnected to the Detroit Water and Sewerage Department, and Snyder soon appointed a Flint Water Advisory Task Force to evaluate what went wrong. The task force sent Snyder a summary of its findings Tuesday that zeroed in on the Department of Environmental Quality's handling of the switchover.

"Although many individuals and entities at state and local levels contributed to creating and prolonging the problem, (DEQ) is the government agency that has responsibility to ensure safe drinking water in Michigan," the task force summary reads. "It failed in that responsibility and must be held accountable for that failure."

Task force members highlighted several areas where state oversight of the Flint situation failed.

■DEQ's Office of Drinking Water and Municipal Assistance focused too much on "technical compliance" with the federal Lead and Copper Rule. The mindset resulted in a "failure to recognize a number of indications that switching the water source in Flint would — and did — compromise both water safety and water quality."

■DEQ's public response to rising concerns among Flint residents and researchers was characterized by task force members as one of "aggressive dismissal, belittlement and attempts to discredit these efforts and the individuals involved." The department "seems to have been more determined to discredit the work of others — who ultimately proved to be right — that to pursue its own oversight responsibility."

■DEQ staff members were also identified as being behind a decision not to provide immediate corrosion controls, such as phosphorus, to prevent lead from leaching into the water, during the switch to the Flint River. "The decision not to require (corrosion controls) ... led directly to the contamination of the Flint system," according to the initial report.

Chris Kolb, a task force co-chair and president of the Michigan Environmental Council, said after Wyant's Tuesday resignation that the DEQ's faulty approach in some areas was glaring.

"The key reality is that no one seemed to have asked the question, 'What happens if we don 't continue using corrosion controls?'" Kolb said. "If someone would have asked that question and thought about it, the answer would have been 'You'll see corrosion and the leaching of metals into the water' — exactly what you saw in Flint."

Keith Creagh

LANSING -- Gov. Rick Snyder named state Department of Natural Resources Director Keith Creagh as the interim head of the Michigan Department of Environmental Quality on Wednesday, one day after he accepted the resignation of Dan Wyant as part of the fallout from the Flint drinking water crisis.

"Keith has an unparalleled passion for Michigan's environment, working closely with the DEQ during his years with both the DNR and the Michigan Department of Agriculture and Rural Development," Snyder said in a news release. "I am confident his knowledge and experience will help ensure a seamless transition while we work to identify a long-term director for the DEQ."

The appointment is effective Monday.

Creagh has served as DNR director since July 2012 and was previously director of the Michigan Department of Agriculture and Rural Development. Before that, Creagh served as director of industry affairs for Lansing-based Neogen, which provides food and animal safety solutions to the agri-food industry. He received a bachelor's degree from Michigan Technological University.

An unknown number of Flint residents were poisoned by lead in their drinking water in 2014 and 2015 after the city, while under the control of a state-appointed emergency manager, switched its water supply source from Lake Huron to the Flint River as a cost-cutting move. Wyant acknowledged the DEQ failed to require the city to add needed corrosion-control chemicals and that the corrosive Flint River water caused lead from pipes, joints and fixtures to leach into the water. The DEQ has also been faulted for its role in a round of lead-in-water tests that wrapped up in June and for initially dismissing reports of an increase in lead levels in the blood of Flint children.

Lead can cause irreparable brain damage in children and has been linked to behavioral problems.

A letter Tuesday from the Flint Water Advisory Task Force, appointed by Snyder to investigate the lead contamination of Flint's drinking water, said the DEQ has "primary responsibility" for what happened and that the agency had developed a culture geared toward minimal and technical compliance, rather than doing whatever is needed to assure safe drinking water.

The task force also criticized the tone and substance of DEQ communications with the public, saying they were marked by a "persistent tone of scorn and derision."

The DEQ's communications director, Brad Wurfel, announced his resignation Tuesday.

Snyder, who apologized Tuesday to the people of Flint, said more personnel changes are on the way.

Bill Moritz, the natural resources deputy at the DNR who previously served as chief and assistant chief of the wildlife division and as a deer research specialist, will serve as interim DNR director, Snyder said.

State board rejects recall petitions for Snyder, senators (AP)

- 23 hrs ago

  http://www.michigansthumb.com/news/article_056048b2-aef0-11e5-8bdf-3b1e8c38a0b0.html

-

LANSING (AP) — People attempting longshot efforts to recall Gov. Rick Snyder and two lawmakers from office will have to try again with state election officials.

The Board of State Canvassers on Tuesday rejected recall petitions for the Republican governor, Republican Senate Majority Leader Arlan Meekhof and Republican Sen. Wayne Schmidt of Traverse City, ruling the petitions did not factually and clearly state reasons to recall the elected officials.

Detroit resident Angelo Brown is trying to remove Snyder over his administration's handling of Flint's drinking water crisis.

Some residents in Meekhof and Schmidt's districts are angry over their votes in November for fuel tax and vehicle registration fee increases designed to improve roads. It appears likely they will return to Lansing with revised petition language.
